This is namespace SocktCnst.

Topics

Name	Description
Constants (see page 2)	The following table lists constants in this documentation.

Constants

Name	Description
ckInterceptGUID (see page 2)	This is constant SocktCnst.ckInterceptGUID.
ckPort (see page 3)	This is constant SocktCnst.ckPort.
ckRegistered (see page 3)	This is constant SocktCnst.ckRegistered.
ckShowHost (see page 3)	This is constant SocktCnst.ckShowHost.
ckThreadCacheSize (see page 4)	This is constant SocktCnst.ckThreadCacheSize.
ckTimeout (see page 4)	This is constant SocktCnst.ckTimeout.
csSettings (see page 4)	This is constant SocktCnst.csSettings.
KEY_IE (see page 5)	This is constant SocktCnst.KEY_IE.
KEY_SOCKETSERVER (see page 5)	This is constant SocktCnst.KEY_SOCKETSERVER.
SAlreadyRunning (see page 5)	This is constant SocktCnst.SAlreadyRunning.
SApplicationName (see page 6)	This is constant SocktCnst.SApplicationName.
SErrChangeSettings (see page 6)	This is constant SocktCnst.SErrChangeSettings.
SErrClose (see page 6)	This is constant SocktCnst.SErrClose.
SHostUnknown (see page 7)	This is constant SocktCnst.SHostUnknown.
SNotShown (see page 7)	This is constant SocktCnst.SNotShown.
SNotUntilRestart (see page 7)	This is constant SocktCnst.SNotUntilRestart.
SNoWinSock2 (see page 8)	This is constant SocktCnst.SNoWinSock2.
SOpenError (see page 8)	This is constant SocktCnst.SOpenError.
SQueryDisconnect (see page 8)	This is constant SocktCnst.SQueryDisconnect.
SServiceName (see page 9)	This is constant SocktCnst.SServiceName.
SServiceOnly (see page 9)	This is constant SocktCnst.SServiceOnly.
SStatusline (see page 9)	This is constant SocktCnst.SStatusline.

1.1 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ckInterceptGUID (see page 2)	This is constant SocktCnst.ckInterceptGUID.
ckPort (see page 3)	This is constant SocktCnst.ckPort.
ckRegistered (see page 3)	This is constant SocktCnst.ckRegistered.
ckShowHost (see page 3)	This is constant SocktCnst.ckShowHost.
ckThreadCacheSize (see page 4)	This is constant SocktCnst.ckThreadCacheSize.
ckTimeout (see page 4)	This is constant SocktCnst.ckTimeout.
csSettings (see page 4)	This is constant SocktCnst.csSettings.
KEY_IE (see page 5)	This is constant SocktCnst.KEY_IE.
KEY_SOCKETSERVER (see page 5)	This is constant SocktCnst.KEY_SOCKETSERVER.
SAlreadyRunning (see page 5)	This is constant SocktCnst.SAlreadyRunning.
SApplicationName (see page 6)	This is constant SocktCnst.SApplicationName.
SErrChangeSettings (see page 6)	This is constant SocktCnst.SErrChangeSettings.
SErrClose (see page 6)	This is constant SocktCnst.SErrClose.
SHostUnknown (see page 7)	This is constant SocktCnst.SHostUnknown.
SNotShown (see page 7)	This is constant SocktCnst.SNotShown.
SNotUntilRestart (see page 7)	This is constant SocktCnst.SNotUntilRestart.
SNoWinSock2 (see page 8)	This is constant SocktCnst.SNoWinSock2.
SOpenError (see page 8)	This is constant SocktCnst.SOpenError.
SQueryDisconnect (see page 8)	This is constant SocktCnst.SQueryDisconnect.
SServiceName (see page 9)	This is constant SocktCnst.SServiceName.
SServiceOnly (see page 9)	This is constant SocktCnst.SServiceOnly.
SStatusline (see page 9)	This is constant SocktCnst.SStatusline.

1.1.1 SocktCnst.ckInterceptGUID Constant

Pascal

```
ckInterceptGUID = 'InterceptGUID';
```

C++

```
ckInterceptGUID = 'InterceptGUID';
```

File

SocktCnst

Description

This is constant SocktCnst.ckInterceptGUID.

1.1.2 SocktCnst.ckPort Constant

Pascal

```
ckPort = 'Port';
```

C++

```
ckPort = 'Port';
```

File

SocktCnst

Description

This is constant SocktCnst.ckPort.

1.1.3 SocktCnst.ckRegistered Constant

Pascal

```
ckRegistered = 'RegisteredOnly';
```

C++

```
ckRegistered = 'RegisteredOnly';
```

File

SocktCnst

Description

This is constant SocktCnst.ckRegistered.

1.1.4 SocktCnst.ckShowHost Constant

Pascal

```
ckShowHost = 'ShowHost';
```

C++

```
ckShowHost = 'ShowHost';
```

File

SocktCnst

Description

This is constant SocktCnst.ckShowHost.

1.1.5 SocktCnst.ckThreadCacheSize Constant

Pascal

```
ckThreadCacheSize = 'ThreadCacheSize';
```

C++

```
ckThreadCacheSize = 'ThreadCacheSize';
```

File

SocktCnst

Description

This is constant SocktCnst.ckThreadCacheSize.

1.1.6 SocktCnst.ckTimeout Constant

Pascal

```
ckTimeout = 'Timeout';
```

C++

```
ckTimeout = 'Timeout';
```

File

SocktCnst

Description

This is constant SocktCnst.ckTimeout.

1.1.7 SocktCnst.csSettings Constant

Pascal

```
csSettings = 'Settings';
```

C++

```
csSettings = 'Settings';
```

File

SocktCnst

Description

This is constant SocktCnst.csSettings.

1.1.8 SocktCnst.KEY_IE Constant

Pascal

```
KEY_IE = 'SOFTWARE\Microsoft\Internet Explorer';
```

C++

```
KEY_IE = 'SOFTWARE\Microsoft\Internet Explorer';
```

File

SocktCnst

Description

This is constant SocktCnst.KEY_IE.

1.1.9 SocktCnst.KEY_SOCKETSERVER Constant

Pascal

```
KEY_SOCKETSERVER = '\SOFTWARE\Borland\Socket Server';
```

C++

```
KEY_SOCKETSERVER = '\SOFTWARE\Borland\Socket Server';
```

File

SocktCnst

Description

This is constant SocktCnst.KEY_SOCKETSERVER.

1.1.10 SocktCnst.SAlreadyRunning Constant

Pascal

```
SAlreadyRunning = 'The Socket Server is already running';
```

C++

```
SAlreadyRunning = 'The Socket Server is already running';
```

File

SocktCnst

Description

This is constant SocktCnst.SAlreadyRunning.

1.1.11 ScktCnst.SApplicationName Constant

Pascal

```
SApplicationName = 'Borland Socket Server';
```

C++

```
SApplicationName = 'Borland Socket Server';
```

File

ScktCnst

Description

This is constant ScktCnst.SApplicationName.

1.1.12 ScktCnst.SErrChangeSettings Constant

Pascal

```
SErrChangeSettings = 'Cannot change settings when there are active connections. Kill
connections?';
```

C++

```
SErrChangeSettings = 'Cannot change settings when there are active connections. Kill
connections?';
```

File

ScktCnst

Description

This is constant ScktCnst.SErrChangeSettings.

1.1.13 ScktCnst.SErrClose Constant

Pascal

```
SErrClose = 'Cannot exit when there are active connections. Kill connections?';
```

C++

```
SErrClose = 'Cannot exit when there are active connections. Kill connections?';
```

File

ScktCnst

Description

This is constant ScktCnst.SErrClose.

1.1.14 SocktCnst.SHostUnknown Constant

Pascal

```
SHostUnknown = '(Unknown)';
```

C++

```
SHostUnknown = '(Unknown)';
```

File

SocktCnst

Description

This is constant SocktCnst.SHostUnknown.

1.1.15 SocktCnst.SNotShown Constant

Pascal

```
SNotShown = '(Not Shown)';
```

C++

```
SNotShown = '(Not Shown)';
```

File

SocktCnst

Description

This is constant SocktCnst.SNotShown.

1.1.16 SocktCnst.SNotUntilRestart Constant

Pascal

```
SNotUntilRestart = 'This change will not take affect until the Socket Server is restarted';
```

C++

```
SNotUntilRestart = 'This change will not take affect until the Socket Server is restarted';
```

File

SocktCnst

Description

This is constant SocktCnst.SNotUntilRestart.

1.1.17 ScktCnst.SNoWinSock2 Constant

Pascal

```
SNoWinSock2 = 'WinSock 2 must be installed to use the socket connection';
```

C++

```
SNoWinSock2 = 'WinSock 2 must be installed to use the socket connection';
```

File

ScktCnst

Description

This is constant ScktCnst.SNoWinSock2.

1.1.18 ScktCnst.SOpenError Constant

Pascal

```
SOpenError = 'Error opening port %d with error: %s';
```

C++

```
SOpenError = 'Error opening port %d with error: %s';
```

File

ScktCnst

Description

This is constant ScktCnst.SOpenError.

1.1.19 ScktCnst.SQueryDisconnect Constant

Pascal

```
SQueryDisconnect = 'Disconnecting clients can cause application errors. Continue?';
```

C++

```
SQueryDisconnect = 'Disconnecting clients can cause application errors. Continue?';
```

File

ScktCnst

Description

This is constant ScktCnst.SQueryDisconnect.

1.1.20 SocktCnst.SServiceName Constant

Pascal

```
SServiceName = 'SocketServer';
```

C++

```
SServiceName = 'SocketServer';
```

File

SocktCnst

Description

This is constant SocktCnst.SServiceName.

1.1.21 SocktCnst.SServiceOnly Constant

Pascal

```
SServiceOnly = 'The Socket Server can only be run as a service on NT 3.51 and prior';
```

C++

```
SServiceOnly = 'The Socket Server can only be run as a service on NT 3.51 and prior';
```

File

SocktCnst

Description

This is constant SocktCnst.SServiceOnly.

1.1.22 SocktCnst.SStatusline Constant

Pascal

```
SStatusline = '%d current connections';
```

C++

```
SStatusline = '%d current connections';
```

File

SocktCnst

Description

This is constant SocktCnst.SStatusline.

2 ScktComp Namespace

This is namespace ScktComp.

Topics

Name	Description
Classes (see page 13)	The following table lists classes in this documentation.
Functions (see page 144)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 145)	The following table lists structs, records, enums in this documentation.
Types (see page 150)	The following table lists types in this documentation.
Constants (see page 154)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESocketError (see page 13)	ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TAbstractSocket (see page 14)	TAbstractSocket is the abstract base class for all socket components.
	TClientSocket (see page 24)	TClientSocket manages socket connections for a TCP/IP client.
	TClientWinSocket (see page 35)	TClientWinSocket describes the client endpoint of a Windows socket connection.
	TCustomServerSocket (see page 39)	TCustomServerSocket is the base class for all server socket components.
	TCustomSocket (see page 56)	TCustomSocket is the base class for socket components.
	TCustomWinSocket (see page 64)	TCustomWinSocket is the base class for all Windows socket objects.
	TServerAcceptThread (see page 90)	This is class ScktComp.TServerAcceptThread.
	TServerClientThread (see page 95)	TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.
	TServerClientWinSocket (see page 104)	TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.
	TServerSocket (see page 108)	TServerSocket manages server socket connections for a TCP/IP server.
	TServerWinSocket (see page 120)	TServerWinSocket describes the endpoint of a listening server socket connection.
	TWinSocketStream (see page 138)	TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

Constants

Name	Description
CM_DEFERFREE (see page 154)	This is constant ScktComp.CM_DEFERFREE.
CM_LOOKUPCOMPLETE (see page 154)	This is constant ScktComp.CM_LOOKUPCOMPLETE.
CM_SOCKETMESSAGE (see page 154)	This is constant ScktComp.CM_SOCKETMESSAGE.

Functions

	Name	Description
	SetErrorProc (see page 144)	Replaces the exception handler for error messages that are received from a Windows socket connection.

Structs, Records, Enums

	Name	Description
	TAsyncStyle (see page 145)	This is record ScktComp.TAsyncStyle.
	TClientType (see page 146)	This is record ScktComp.TClientType.
	TCMLookupComplete (see page 146)	This is record ScktComp.TCMLookupComplete.
	TCMSocketMessage (see page 147)	This is record ScktComp.TCMSocketMessage.
	TErrorEvent (see page 147)	This is record ScktComp.TErrorEvent.
	TLookupState (see page 148)	This is record ScktComp.TLookupState.
	TServerType (see page 148)	This is record ScktComp.TServerType.
	TSocketEvent (see page 148)	TSocketEvent identifies the operation that a socket is performing.

Types

Name	Description
TAsyncStyles (see page 150)	This is type ScktComp.TAsyncStyles.
TGetSocketEvent (see page 150)	This is type ScktComp.TGetSocketEvent.
TGetThreadEvent (see page 151)	This is type ScktComp.TGetThreadEvent.
TSocketErrorEvent (see page 151)	TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.
TSocketErrorProc (see page 152)	This is type ScktComp.TSocketErrorProc.
TSocketEventEvent (see page 152)	This is type ScktComp.TSocketEventEvent.
TSocketNotifyEvent (see page 152)	The type for event handlers which respond to events during the expected course of forming or using a socket connection.
TThreadNotifyEvent (see page 153)	This is type ScktComp.TThreadNotifyEvent.

2.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESocketError (see page 13)	ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TAbstractSocket (see page 14)	TAbstractSocket is the abstract base class for all socket components.
	TClientSocket (see page 24)	TClientSocket manages socket connections for a TCP/IP client.
	TClientWinSocket (see page 35)	TClientWinSocket describes the client endpoint of a Windows socket connection.
	TCustomServerSocket (see page 39)	TCustomServerSocket is the base class for all server socket components.
	TCustomSocket (see page 56)	TCustomSocket is the base class for socket components.
	TCustomWinSocket (see page 64)	TCustomWinSocket is the base class for all Windows socket objects.
	TServerAcceptThread (see page 90)	This is class ScktComp.TServerAcceptThread.
	TServerClientThread (see page 95)	TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.
	TServerClientWinSocket (see page 104)	TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.
	TServerSocket (see page 108)	TServerSocket manages server socket connections for a TCP/IP server.
	TServerWinSocket (see page 120)	TServerWinSocket describes the endpoint of a listening server socket connection.
	TWinSocketStream (see page 138)	TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

2.1.1 ESocketError Class

ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.

Class Hierarchy

Pascal

```
ESocketError = class(Exception);
```

C++

```
class ESocketError : public Exception;
```

File

ScktComp

Description

ESocketError is raised if

A socket cannot be created.

A socket cannot be initialized.

A socket cannot be opened.

An application tries to change the properties of an already open socket.

A failure occurs when reading from or writing to a socket.

A socket cannot be properly closed.

There are two ESocketError classes, one in the ScktComp (see page 11) unit and one in the Sockets (see page 1367) unit. The two exception classes are identically defined and serve the same function for different categories of socket objects. The two definitions occur simply to ensure that ESocketError is defined for all socket objects.

See Also

TCustomWinSocket (see page 64)

2.1.2 TAbstractSocket Class

TAbstractSocket is the abstract base class for all socket components.

Class Hierarchy

Pascal

```
TAbstractSocket = class(TComponent);
```

C++

```
class TAbstractSocket : public TComponent;
```

File

ScktComp

Description

TAbstractSocket introduces properties and methods to enable an application to work with sockets. A socket encapsulates a set of communication protocols to allow the application to connect to other machines for reading or writing information. Sockets (see page 1367) provide connections based on the TCP/IP protocol. They also allow connections that use the Xerox Network System (see page 3159) (XNS), Digital's DECnet protocol, or Novell's IPX/SPX family. Sockets (see page 1367) allow an application to form connections to other machines without being concerned with the details of the actual networking software.

The properties of TAbstractSocket describe the IP address of the socket and service it provides or seeks. Not all descendants of TAbstractSocket use all of these properties. For example, server sockets do not surface the IP address because it is read implicitly from the system running the application.

Do not create instances of TAbstractSocket. Use a descendant of TAbstractSocket to add the ability to communicate with other machines to an application. To create a socket that initiates the connection with another machine, use TClientSocket (see page 24). To create a socket that responds to requests for connections from other machines, use TServerSocket (see page 108).

See Also

TClientSocket (see page 24)

TCustomWinSocket (see page 64)

TServerSocket (see page 108)

TCustomSocket (see page 56)

2.1.2.1 TAbstractSocket Members

The following tables list the members exposed by TAbstractSocket.

Protected Methods

	Name	Description
	DoActivate (see page 16)	Provides the prototype of a method to open or close the socket connection.
	Error (see page 16)	Provides the prototype of a method that responds to error conditions.
	Event (see page 17)	Provides the prototype of a method that responds when specific socket events occur.
	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetService (see page 21)	Sets the Service (see page 23) property.

Protected Properties

	Name	Description
	Active (see page 21)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 22)	Specifies the IP address of the server system.
	Host (see page 22)	Specifies an alias for the IP address of the server system.
	Port (see page 23)	Specifies the ID number that identifies the server socket connection.
	Service (see page 23)	Specifies the name of the service for which the socket connection is used.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
	Open (see page 19)	Opens the socket connection.

2.1.2.2 TAbstractSocket Methods

The methods of the TAbstractSocket class are listed here.

Protected Methods

	Name	Description
	DoActivate (see page 16)	Provides the prototype of a method to open or close the socket connection.
	Error (see page 16)	Provides the prototype of a method that responds to error conditions.
	Event (see page 17)	Provides the prototype of a method that responds when specific socket events occur.
	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetService (see page 21)	Sets the Service (see page 23) property.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
	Open (see page 19)	Opens the socket connection.

2.1.2.2.1 TAbstractSocket.Close Method

Shuts down the socket connection.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to shut down the socket connection. Close sets the Active (see page 21) property to false.

For client sockets, Close terminates the connection to the server. For server sockets, Close shuts down the connection so that the server socket is no longer listening for client requests.

See Also

Active (see page 21)

2.1.2.2.2 TAbstractSocket.DoActivate Method

Provides the prototype of a method to open or close the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall DoActivate(Boolean Value) = 0;
```

Description

Descendants of TAbstractSocket (see page 14) override DoActivate to provide a method that initiates or terminates the socket connection. The steps that need to be taken to open or close a connection depend on whether the socket is a client socket or a server socket.

See Also

Active (see page 21)

Open (see page 19)

Close (see page 16)

2.1.2.2.3 TAbstractSocket.Error Method

Provides the prototype of a method that responds to error conditions.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
virtual; abstract;
```

C++

```
virtual __fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode) = 0;
```

Description

Descendants of TAbstractSocket (see page 14) must override the abstract or, in C++ terminology, pure virtual Error method to provide a response when socket errors occur. Applications cannot call Error. The Windows socket object that encounters the error condition calls Error automatically.

The Socket parameter indicates the Windows socket object that encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Setting this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnErrorEvent (see page 89)

InitSocket (see page 18)

2.1.2.2.4 TAbstractSocket.Event Method

Provides the prototype of a method that responds when specific socket events occur.

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); virtual; abstract;
```

C++

```
virtual __fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent) = 0;
```

Description

Descendants of TAbstractSocket (see page 14) must override the abstract or, in C++ terminology, pure virtual Event method to provide a response to calls that arise during the normal functioning of the socket. Applications cannot call Event. The Windows socket object calls Event at appropriate times.

The Socket parameter indicates the Windows socket object that calls Event to indicate when specific events occur.

The SocketEvent parameter indicates the event that occurred. It has one of the following values:

Value	Meaning
seLookup	(client sockets only) The Windows socket object is about to locate the server socket. Changing the properties of the client socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will affect the attempted connection.
seConnecting	(client sockets only) The server socket has been located but the connection isn't completed. This is the first opportunity to obtain the actual server port and IP address used for the connection, which may differ from those of the listening socket contacted initially.
seConnect	The socket connection has just been established. This is the point when a socket starts reading or writing over the connection.
seListen	(server sockets only) The Windows socket object has been initialized and is about to open a listening connection. Changing the properties of the server socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will the listening connection.
seAccept	(server sockets only) A client connection request has just been accepted. This is the first opportunity to obtain the port and IP address of the individual client connection.
seWrite	The socket is ready for information to be written.
seRead	The socket is receiving information from a socket on the other end of the connection.

See Also

OnSocketEvent (see page 90)

InitSocket (see page 18)

2.1.2.2.5 TAbstractSocket.InitSocket Method

Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.

Pascal

```
procedure InitSocket(Socket: TCustomWinSocket);
```

C++

```
__fastcall InitSocket(TCustomWinSocket Socket);
```

Description

Applications cannot call this protected method. InitSocket is called automatically by the socket's constructor, immediately after the Windows socket object is created. It allows the socket component to respond to events on the Windows socket object by assigning an OnErrorEvent handler that calls Error (see page 16) and an OnSocketEvent handler that calls Event (see page 17).

The Socket parameter specifies the Windows socket object that passes events on to the socket component.

See Also

Error (see page 16)

TAbstractSocket (see page 14)

OnErrorEvent (see page 89)

OnSocketEvent (see page 90)

2.1.2.2.6 TAbstractSocket.Loaded Method

Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see

page 21) property.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Applications cannot call this protected method. Loaded is called automatically after the socket component has been loaded from a stream. Loaded overrides the default method to implement the value of the Active (see page 21) property that was saved with the socket component.

See Also

Active (see page 21)

2.1.2.2.7 TAbstractSocket.Open Method

Opens the socket connection.

Pascal

```
procedure Open;
```

C++

```
__fastcall Open();
```

Description

Call Open to initiate the socket connection. Open sets the Active (see page 21) property to true.

For client sockets, Open locates and connects to a server. For server sockets, Open opens the socket connection in a listening mode, but does not complete the connection to a client socket.

See Also

Active (see page 21)

2.1.2.2.8 TAbstractSocket.SetActive Method

Sets the Active (see page 21) property.

Pascal

```
procedure SetActive(Value: Boolean);
```

C++

```
__fastcall SetActive(Boolean Value);
```

Description

SetActive is the protected implementation of the Active (see page 21) property. SetActive calls the DoActivate (see page 16) method to open or close the socket connection.

See Also

Active (see page 21)

DoActivate (see page 16)

2.1.2.2.9 TAbstractSocket.SetAddress Method

Sets the Address (see page 22) property.

Pascal

```
procedure SetAddress(Value: string);
```

C++

```
__fastcall SetAddress(UnicodeString Value);
```

Description

SetAddress is the protected implementation of the Address (see page 22) property. SetAddress raises an ESocketError (see page 13) exception if an attempt is made to set the Address (see page 22) property when the socket connection is open.

See Also

Active (see page 21)

Address (see page 22)

ESocketError (see page 13)

2.1.2.2.10 TAbstractSocket.SetHost Method

Sets the Host (see page 22) property.

Pascal

```
procedure SetHost(Value: string);
```

C++

```
__fastcall SetHost(UnicodeString Value);
```

Description

SetHost is the protected implementation of the Host (see page 22) property. SetHost raises an ESocketError (see page 13) exception if an attempt is made to set the Host (see page 22) property when the socket connection is open.

See Also

Active (see page 21)

ESocketError (see page 13)

Host (see page 22)

2.1.2.2.11 TAbstractSocket.SetPort Method

Sets the Port (see page 23) property.

Pascal

```
procedure SetPort(Value: Integer);
```

C++

```
__fastcall SetPort(int Value);
```

Description

SetPort is the protected implementation of the Port (see page 23) property. SetPort raises an ESocketError (see page 13) exception if an attempt is made to set the Port (see page 23) property when the socket connection is open.

See Also

Active (see page 21)

ESocketError (see page 13)

Port (see page 23)

2.1.2.2.12 TAbstractSocket.SetService Method

Sets the Service (see page 23) property.

Pascal

```
procedure SetService(Value: string);
```

C++

```
__fastcall SetService(UnicodeString Value);
```

Description

SetService is the protected implementation of the Service (see page 23) property. SetService raises an ESocketError (see page 13) exception if an attempt is made to set the Service (see page 23) property when the socket connection is open.

See Also

Active (see page 21)

ESocketError (see page 13)

Service (see page 23)

2.1.2.3 TAbstractSocket Properties

The properties of the TAbstractSocket class are listed here.

Protected Properties

	Name	Description
	Active (see page 21)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 22)	Specifies the IP address of the server system.
	Host (see page 22)	Specifies an alias for the IP address of the server system.
	Port (see page 23)	Specifies the ID number that identifies the server socket connection.
	Service (see page 23)	Specifies the name of the service for which the socket connection is used.

2.1.2.3.1 TAbstractSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting

Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open (see page 19) or Close (see page 16) method to open or close the connection.

See Also

Close (see page 16)

Open (see page 19)

SetActive (see page 19)

2.1.2.3.2 TAbstractSocket.Address Property

Specifies the IP address of the server system.

Pascal

```
property Address: string;
```

C++

```
__property UnicodeString Address;
```

Description

Address is a string of four numeric (byte) values in the standard Internet dot notation, such as

```
123.197.1.2
```

For client sockets, set Address to the IP address of the server to which the socket should connect. When the connection is opened, the value of Address is bound to the connection.

If the socket specifies the Host (see page 22) property, the address for the connection is taken from the IP address associated with Host (see page 22), rather than the value of Address. Specifying the server system by giving the IP address is faster, because the socket doesn't need to search for the IP address associated with the host name before it can locate the server system.

A single system may support more than one IP address.

Note: Trying to change Address when the connection is open will raise an ESocketError (see page 13) exception.

See Also

ESocketError (see page 13)

Host (see page 22)

SetAddress (see page 20)

2.1.2.3.3 TAbstractSocket.Host Property

Specifies an alias for the IP address of the server system.

Pascal

```
property Host: string;
```

C++

```
__property UnicodeString Host;
```

Description

Host is a string containing the domain name and service of a particular system, such as

```
http://www.wSite.Com
```

For client sockets, set Host to the system with which the client socket should form a connection. When the socket opens a connection, it looks up the IP address for the server socket using the value of Host.

Some servers change the system or IP address that is associated with a particular host name. Using a host name allows the client socket to find the abstract site represented by the host name, even when it has moved to a new IP address.

If Host is set, it takes precedence over the Address (see page 22) property when looking up the address of the server.

Note: Trying to change Host when the connection is open will raise an ESocketError (see page 13) exception.

See Also

Address (see page 22)

ESocketError (see page 13)

SetHost (see page 20)

2.1.2.3.4 TAbstractSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host (see page 22) or Address (see page 22) property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError (see page 13) exception.

See Also

Address (see page 22)

ESocketError (see page 13)

Host (see page 22)

Service (see page 23)

SetPort (see page 20)

2.1.2.3.5 TAbstractSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property UnicodeString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the server Port (see page 23) to use for the socket connection. For server sockets, using Service rather than Port (see page 23) ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError (see page 13) exception.

See Also

ESocketError (see page 13)

Port (see page 23)

SetService (see page 21)

LookupService (see page 75)

2.1.3 TClientSocket Class

TClientSocket manages socket connections for a TCP/IP client.

Class Hierarchy

Pascal

```
TClientSocket = class(TCustomSocket);
```

C++

```
class TClientSocket : public TCustomSocket;
```

File

ScktComp

Description

Add a TClientSocket object to a form or data module to turn an application into a TCP/IP client. TClientSocket specifies a desired connection to a TCP/IP server, manages the connection when it is open, and terminates the connection when the application is through.

Note: See the CHAT demo for an example of how to use TClientSocket.

See Also

TClientWinSocket (see page 35)

TServerSocket (see page 108)

2.1.3.1 TClientSocket Members

The following tables list the members exposed by TClientSocket.

Protected Events

	Name	Description
	OnAccept (see page 59)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnListen (see page 61)	Occurs just before a server socket is opened for listening.

Protected Methods

	Name	Description
V	DoActivate (see page 27)	Provides the prototype of a method to open or close the socket connection.
A	Error (see page 16)	Provides the prototype of a method that responds to error conditions.
V	Error (see page 58)	Generates an OnError (see page 61) event.
A	Event (see page 17)	Provides the prototype of a method that responds when specific socket events occur.
V	Event (see page 58)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetClientType (see page 27)	This is GetClientType, a member of class TClientSocket.
	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
V	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetClientType (see page 27)	This is SetClientType, a member of class TClientSocket.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetService (see page 21)	Sets the Service (see page 23) property.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
V	Create (see page 26)	Creates an instance of TClientSocket (see page 24).
V	Destroy (see page 26)	Destroys an instance of TClientSocket (see page 24).
	Open (see page 19)	Opens the socket connection.

Public Properties

	Name	Description
R	Socket (see page 31)	Describes the client endpoint of the Windows client socket connection.

Published Events

	Name	Description
	OnConnect (see page 32)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 32)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 33)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 33)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 34)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 34)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 35)	Occurs when a client socket should write information to the socket connection.

Published Properties

	Name	Description
	Active (see page 28)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 28)	Specifies the IP address of the server system.
	ClientType (see page 29)	Specifies whether the client socket reads and writes information asynchronously over the socket connection.
	Host (see page 30)	Specifies an alias for the IP address of the server system.
	Port (see page 30)	Specifies the ID number that identifies the server socket connection.
	Service (see page 31)	Specifies the name of the service for which the socket connection is used.

2.1.3.2 TClientSocket.Create Constructor

Creates an instance of TClientSocket (see page 24).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TClientSocket(TComponent * AOwner);
```

Description

Call Create to create and initialize a client socket component at runtime. TClientSocket (see page 24) objects placed at design time are created automatically.

After calling the inherited constructor, Create

Allocates the TClientWinSocket (see page 35) object that describes the client endpoint of the Windows socket connection.

I initializes the event and error dispatchers for the client socket.

See Also

TClientWinSocket (see page 35)

Create

2.1.3.3 TClientSocket.Destroy Destructor

Destroys an instance of TClientSocket (see page 24).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TClientSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the client socket is not nil, and only then calls Destroy.

Destroy frees the TClientWinSocket (see page 35) object that describes the client endpoint of the Windows socket connection.

See Also

System::TObject::Free (see page 3372)

TClientWinSocket (see page 35)

2.1.3.4 TClientSocket Methods

The methods of the TClientSocket class are listed here.

Protected Methods

	Name	Description
	DoActivate (see page 27)	Provides the prototype of a method to open or close the socket connection.
	GetClientType (see page 27)	This is GetClientType, a member of class TClientSocket.
	SetClientType (see page 27)	This is SetClientType, a member of class TClientSocket.

2.1.3.4.1 TClientSocket.DoActivate Method

Provides the prototype of a method to open or close the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); override;
```

C++

```
virtual __fastcall DoActivate(Boolean Value);
```

Description

Descendants of TAbstractSocket override DoActivate to provide a method that initiates or terminates the socket connection. The steps that need to be taken to open or close a connection depend on whether the socket is a client socket or a server socket.

See Also

Active (see page 21)

Open (see page 19)

Close (see page 16)

2.1.3.4.2 TClientSocket.GetClientType Method

Pascal

```
function GetClientType: TClientType;
```

C++

```
__fastcall TClientType GetClientType();
```

Description

This is GetClientType, a member of class TClientSocket.

2.1.3.4.3 TClientSocket.SetClientType Method

Pascal

```
procedure SetClientType(Value: TClientType);
```

C++

```
__fastcall SetClientType(TClientType Value);
```

Description

This is SetClientType, a member of class TClientSocket.

2.1.3.5 TClientSocket Properties

The properties of the TClientSocket class are listed here.

Public Properties

	Name	Description
	Socket (see page 31)	Describes the client endpoint of the Windows client socket connection.

Published Properties

	Name	Description
	Active (see page 28)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 28)	Specifies the IP address of the server system.
	ClientType (see page 29)	Specifies whether the client socket reads and writes information asynchronously over the socket connection.
	Host (see page 30)	Specifies an alias for the IP address of the server system.
	Port (see page 30)	Specifies the ID number that identifies the server socket connection.
	Service (see page 31)	Specifies the name of the service for which the socket connection is used.

2.1.3.5.1 TClientSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 16)

Open (see page 19)

SetActive (see page 19)

2.1.3.5.2 TClientSocket.Address Property

Specifies the IP address of the server system.

Pascal

```
property Address: string;
```

C++

```
__property UnicodeString Address;
```

Description

Address is a string of four numeric (byte) values in the standard Internet dot notation, such as

`123.197.1.2`

For client sockets, set Address to the IP address of the server to which the socket should connect. When the connection is opened, the value of Address is bound to the connection.

If the socket specifies the Host property, the address for the connection is taken from the IP address associated with Host, rather than the value of Address. Specifying the server system by giving the IP address is faster, because the socket doesn't need to search for the IP address associated with the host name before it can locate the server system.

A single system may support more than one IP address.

Note: Trying to change Address when the connection is open will raise an ESocketError exception.

See Also

ESocketError (see page 13)

Host (see page 22)

SetAddress (see page 20)

2.1.3.5.3 TClientSocket.ClientType Property

Specifies whether the client socket reads and writes information asynchronously over the socket connection.

Pascal

```
property ClientType: TClientType;
```

C++

```
__property TClientType ClientType;
```

Description

Set ClientType to ctNonBlocking to enable the client socket to respond to asynchronous reading and writing events. When ClientType is ctNonBlocking, execution is not blocked by reading and writing over the socket connection. OnRead (see page 34) or OnWrite (see page 35) events occur when the socket needs to read or write over the connection.

Set ClientType to ctBlocking to force all reading and writing to occur synchronously. It is a good idea to include the client socket object in a thread if the ClientType is ctBlocking, so that I/O does not block all execution within the client application.

When ClientType is ctBlocking, use a TWinSocketStream (see page 138) object for reading and writing. TWinSocketStream (see page 138) prevents the application from hanging indefinitely if a problem occurs while reading or writing. It also can wait for the socket connection to indicate its readiness for reading.

Use a non-blocking socket when the socket needs to synchronize reading and writing with server sockets.

See Also

OnRead (see page 63)

OnWrite (see page 63)

TThread

TWinSocketStream (see page 138)

2.1.3.5.4 TClientSocket.Host Property

Specifies an alias for the IP address of the server system.

Pascal

```
property Host: string;
```

C++

```
__property UnicodeString Host;
```

Description

Host is a string containing the domain name and service of a particular system, such as

`http://www.wSite.Com`

For client sockets, set Host to the system with which the client socket should form a connection. When the socket opens a connection, it looks up the IP address for the server socket using the value of Host.

Some servers change the system or IP address that is associated with a particular host name. Using a host name allows the client socket to find the abstract site represented by the host name, even when it has moved to a new IP address.

If Host is set, it takes precedence over the Address property when looking up the address of the server.

Note: Trying to change Host when the connection is open will raise an ESocketError exception.

See Also

Address (see page 22)

ESocketError (see page 13)

SetHost (see page 20)

2.1.3.5.5 TClientSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host or Address property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError exception.

See Also

Address (see page 22)

ESocketError (see page 13)

Host (see page 22)

Service (see page 23)

SetPort (see page 20)

2.1.3.5.6 TClientSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property UnicodeString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the server Port to use for the socket connection. For server sockets, using Service rather than Port ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError exception.

See Also

ESocketError (see page 13)

Port (see page 23)

SetService (see page 21)

LookupService (see page 75)

2.1.3.5.7 TClientSocket.Socket Property

Describes the client endpoint of the Windows client socket connection.

Pascal

```
property Socket: TClientWinSocket;
```

C++

```
__property TClientWinSocket Socket;
```

Description

Use Socket to

Determine the address and port of both the client and server sockets that are bound to the connection.

Read (see page 3634) or write information through the socket connection.

Determine what server notifications the client will respond to.

Obtain the Windows socket handle for making Windows socket API calls.

2.1.3.6 TClientSocket Events

The events of the TClientSocket class are listed here.

Published Events

	Name	Description
	OnConnect (see page 32)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 32)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 33)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 33)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 34)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 34)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 35)	Occurs when a client socket should write information to the socket connection.

2.1.3.6.1 TClientSocket.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnAccept (see page 59)

OnConnecting (see page 60)

OnLookup (see page 62)

2.1.3.6.2 TClientSocket.OnConnecting Event

Occurs for a client socket after the server socket has been located, but before the connection is established.

Pascal

```
property OnConnecting: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnecting;
```

Description

Write an OnConnecting event handler for a client socket to take specific action just before the connection to a server socket is established. This is the first opportunity to obtain the actual port and IP address of the server endpoint of the connection that is about to form.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnConnect (see page 60)

OnLookup (see page 62)

2.1.3.6.3 TClientSocket.OnDisconnect Event

Occurs just before a client socket closes the connection to a server socket.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler to take specific action when the connection to a server socket is about to be terminated. OnDisconnect occurs after the value of the Active property is set to false, but before the actual connection is closed.

See Also

Active (see page 21)

Close (see page 16)

OnConnect (see page 60)

2.1.3.6.4 TClientSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the ErrorCode parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError from being raised.

See Also

ESocketError (see page 13)

2.1.3.6.5 TClientSocket.OnLookup Event

Occurs when a client socket is about to look up the server socket with which it wants to connect.

Pascal

```
property OnLookup: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnLookup;
```

Description

Write an OnLookup event handler for a client socket to take specific action just before attempting to locate a server socket. This is the first opportunity to make Windows API calls that affect the client properties of the socket, such as specifying a particular port number. Use the SocketHandle property of the Socket parameter for Windows API calls.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

Note: Changing the Address, Host, Port, or Service properties of socket component in an OnLookup event handler has no effect on the address or port used to locate a server socket. These properties must be correct before the Open method is called.

See Also

Address (see page 22)

Host (see page 22)

OnConnect (see page 60)

OnConnecting (see page 60)

Open (see page 19)

Port (see page 23)

Service (see page 23)

2.1.3.6.6 TClientSocket.OnRead Event

Occurs when a client socket should read information from the socket connection.

Pascal

```
property OnRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnRead;
```

Description

Write an OnRead event handler to read from the socket connection. If the socket is a blocking socket, use a TWinSocketStream object to read from the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual reading.

Note: Non-blocking sockets do not always receive an OnRead event for the last bit of data passed over the connection. When using a non-blocking socket, check for any unread data in the OnDisconnect event to make sure that everything is handled.

See Also

ReceiveBuf (see page 77)

ReceiveText (see page 78)

TWinSocketStream (see page 138)

OnDisconnect (see page 61)

2.1.3.6.7 TClientSocket.OnWrite Event

Occurs when a client socket should write information to the socket connection.

Pascal

```
property OnWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnWrite;
```

Description

Write an OnWrite to write from the socket connection. If the socket is a blocking socket, use a TWinSocketStream object to write to the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual writing.

See Also

SendBuf (see page 78)

SendStream (see page 79)

SendStreamThenDrop (see page 79)

SendText (see page 80)

TWinSocketStream (see page 138)

2.1.4 TClientWinSocket Class

TClientWinSocket describes the client endpoint of a Windows socket connection.

Class Hierarchy

Pascal

```
TClientWinSocket = class(TCustomWinSocket);
```

C++

```
class TClientWinSocket : public TCustomWinSocket;
```

File

ScktComp

Description

Client socket components use TClientWinSocket to manage the Windows socket API calls for a TCP/IP client application. TClientWinSocket differs from its immediate ancestor TCustomWinSocket (see page 64) only in that it introduces a ClientType (see page 38) property to distinguish blocking from non-blocking client sockets.

See Also

TClientSocket (see page 24)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.4.1 TClientWinSocket Members

The following tables list the members exposed by TClientWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 68)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 70)	Opens a listening connection.
	DoOpen (see page 71)	Opens a connection to a remote socket.
	Error (see page 71)	Generates an OnErrorEvent (see page 89) event.
	Event (see page 72)	Triggers an OnSocketEvent (see page 90) event.
	InitSocket (see page 72)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 81)	Sets the ASyncStyles (see page 83) property.
	SetClientType (see page 38)	This is SetClientType, a member of class TClientWinSocket.

Public Events

	Name	Description
	OnErrorEvent (see page 89)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 90)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
	Accept (see page 68)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 69)	Shuts down the socket connection if it is open.
	Connect (see page 38)	Responds to connection notifications.
	Create (see page 66)	Creates an instance of TCustomWinSocket (see page 64) from a Windows socket handle.
	DefaultHandler (see page 70)	Processes message records.
	Destroy (see page 67)	Destroys an instance of TCustomWinSocket (see page 64).
	Disconnect (see page 70)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 73)	Opens a listening connection for a server socket.
	Lock (see page 74)	Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.
	LookupName (see page 74)	Generates the portion of a Windows Internet socket address structure that describes the host.

	LookupService (see page 75)	Returns the port number associated with a specific service.
	Open (see page 75)	Opens a connection to a remote socket.
V	Read (see page 76)	Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 77)	Reads up to Count bytes from the socket connection into the Buf parameter.
	ReceiveLength (see page 77)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 78)	Reads a string from the socket connection.
	SendBuf (see page 78)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection.
	SendStreamThenDrop (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 80)	Writes the string S to the socket connection.
	Unlock (see page 81)	Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.
V	Write (see page 81)	Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	Addr (see page 82)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 83)	Determines which asynchronous events the socket can receive.
	ClientType (see page 38)	Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.
R	Connected (see page 83)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 84)	Points to application-specific data associated with the socket.
R	Handle (see page 84)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 85)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 85)	Specifies the name of the local system.
R	LocalPort (see page 86)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 86)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 87)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 87)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 88)	Specifies the name of the remote system.
R	RemotePort (see page 88)	Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.
R	SocketHandle (see page 89)	Specifies the Windows handle for the socket.

2.1.4.2 TClientWinSocket Methods

The methods of the TClientWinSocket class are listed here.

Protected Methods

	Name	Description
	SetClientType (see page 38)	This is SetClientType, a member of class TClientWinSocket.

Public Methods

	Name	Description
V	Connect (see page 38)	Responds to connection notifications.

2.1.4.2.1 TClientWinSocket.Connect Method

Responds to connection notifications.

Pascal

```
procedure Connect(Socket: TSocket); override;
```

C++

```
virtual __fastcall Connect(TSocket Socket);
```

Description

Applications can not call this protected method. Connect is called in response to notifications that the client socket has successfully completed a connection to a server socket. The Socket parameter is the Windows socket handle for the socket that receives the notification.

Connect generates an OnSocketEvent (see page 90) event with the SocketEvent parameter set to seConnect. Socket components assign an OnSocketEvent (see page 90) event handler that responds to this event by generating an OnConnect event on the socket component.

Note: Connect is only called if the ASyncStyles (see page 83) property includes asConnect.

See Also

ASyncStyles (see page 83)

OnSocketEvent (see page 90)

OnConnect (see page 60)

2.1.4.2.2 TClientWinSocket.SetClientType Method

Pascal

```
procedure SetClientType(Value: TClientType);
```

C++

```
__fastcall SetClientType(TClientType Value);
```

Description

This is SetClientType, a member of class TClientWinSocket.

2.1.4.3 TClientWinSocket Properties

The properties of the TClientWinSocket class are listed here.

Public Properties

	Name	Description
	ClientType (see page 38)	Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.

2.1.4.3.1 TClientWinSocket.ClientType Property

Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.

Pascal

```
property ClientType: TClientType;
```

C++

```
__property TClientType ClientType;
```

Description

Client socket components set ClientType to reflect their own ClientType property. When ClientType is ctNonBlocking, the client Windows socket responds to asynchronous reading and writing events, and execution is not blocked by reading and writing over the connection. OnSocketEvent (see page 90) events occur when the socket needs to read or write over the connection.

When ClientType is ctBlocking, all reading and writing occur synchronously. It is a good idea to perform all reading and writing in a separate thread if ClientType is ctBlocking. Reading and writing in a separate thread ensures that these operations do not block all execution within the client application.

When ClientType is ctBlocking, use a TWinSocketStream (see page 138) object for reading and writing. TWinSocketStream (see page 138) times out so that the application does not hang when a problem occurs while reading or writing. TWinSocketStream (see page 138) also provides a method to wait, before reading, until the socket connection is ready to send information.

Use a non-blocking socket when the socket needs to synchronize reading and writing with server sockets.

See Also

OnSocketEvent (see page 90)

TThread

TWinSocketStream (see page 138)

2.1.5 TCustomServerSocket Class

TCustomServerSocket is the base class for all server socket components.

Class Hierarchy

Pascal

```
TCustomServerSocket = class(TCustomSocket);
```

C++

```
class TCustomServerSocket : public TCustomSocket;
```

File

ScktComp

Description

TCustomServerSocket introduces new properties and events specific to the functions of a TCP/IP server.

Do not create instances of TCustomServerSocket. Use TCustomServerSocket as a base class when declaring server socket objects that listen for connection requests from other machines.

See Also

TServerWinSocket (see page 120)

TServerSocket (see page 108)

2.1.5.1 TCustomServerSocket Members

The following tables list the members exposed by TCustomServerSocket.

Protected Events

	Name	Description
	OnAccept (see page 59)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 51)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 52)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 52)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 53)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 53)	Occurs when the server socket should write information to a client socket.
	OnConnect (see page 60)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 60)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 61)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 61)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnGetSocket (see page 54)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 54)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 61)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 62)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 63)	Occurs when a client socket should read information from the socket connection.
	OnThreadEnd (see page 55)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 55)	Occurs when the execution thread for a connection to a client socket starts up.
	OnWrite (see page 63)	Occurs when a client socket should write information to the socket connection.

Protected Fields

	Name	Description
	FServerSocket (see page 42)	This is FServerSocket, a member of class TCustomServerSocket.

Protected Methods

	Name	Description
V	DoActivate (see page 42)	Opens or Closes the socket connection.
A	Error (see page 16)	Provides the prototype of a method that responds to error conditions.
V	Error (see page 58)	Generates an OnError (see page 61) event.
A	Event (see page 17)	Provides the prototype of a method that responds when specific socket events occur.
V	Event (see page 58)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetGetSocketEvent (see page 43)	Returns the OnGetSocket (see page 54) event handler.
	GetGetThreadEvent (see page 43)	Returns the OnGetThread (see page 54) event handler.
	GetOnClientError (see page 44)	Returns the OnClientError (see page 52) event handler.
	GetOnClientEvent (see page 44)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 44)	Returns the OnThreadEnd (see page 55) event handler.
	GetOnThreadStart (see page 45)	Returns the OnThreadStart (see page 55) event handler.
	GetServerType (see page 45)	Returns the ServerType (see page 49) property.
	GetThreadCacheSize (see page 45)	Returns the value of the ThreadCacheSize (see page 50) property.

	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
V	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetGetSocketEvent (see page 46)	Sets the OnGetSocket (see page 54) event handler.
	SetGetThreadEvent (see page 46)	Sets the OnGetThread (see page 54) event handler.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetOnClientError (see page 47)	Sets the OnClientError (see page 52) event handler.
	SetOnClientEvent (see page 47)	Sets the client event handlers of the associated TServerWinSocket (see page 120) object.
	SetOnThreadEnd (see page 47)	Sets the OnThreadEnd (see page 55) event handler.
	SetOnThreadStart (see page 48)	Sets the OnThreadStart (see page 55) event handler.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetServerType (see page 48)	Sets the ServerType (see page 49) property.
	SetService (see page 21)	Sets the Service (see page 23) property.
	SetThreadCacheSize (see page 49)	Sets the ThreadCacheSize (see page 50) property.

Protected Properties

	Name	Description
	Active (see page 21)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 22)	Specifies the IP address of the server system.
	Host (see page 22)	Specifies an alias for the IP address of the server system.
	Port (see page 23)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 49)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 23)	Specifies the name of the service for which the socket connection is used.
	ThreadCacheSize (see page 50)	Specifies the maximum number of threads that can be reused for new client connections.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
V	Destroy (see page 41)	Destroys an instance of TCustomServerSocket (see page 39).
	Open (see page 19)	Opens the socket connection.

2.1.5.2 TCustomServerSocket.Destroy Destructor

Destroys an instance of TCustomServerSocket (see page 39).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomServerSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the server socket is not nil, and only then calls Destroy.

Destroy frees the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

System::TObject::Free (see page 3372)

TServerWinSocket (see page 120)

2.1.5.3 TCustomServerSocket Fields

The fields of the TCustomServerSocket class are listed here.

Protected Fields

	Name	Description
	FServerSocket (see page 42)	This is FServerSocket, a member of class TCustomServerSocket.

2.1.5.3.1 TCustomServerSocket.FServerSocket Field

Pascal

```
FServerSocket: TServerWinSocket;
```

C++

```
TServerWinSocket FServerSocket;
```

Description

This is FServerSocket, a member of class TCustomServerSocket.

2.1.5.4 TCustomServerSocket Methods

The methods of the TCustomServerSocket class are listed here.

Protected Methods

	Name	Description
	DoActivate (see page 42)	Opens or Closes the socket connection.
	GetGetSocketEvent (see page 43)	Returns the OnGetSocket (see page 54) event handler.
	GetGetThreadEvent (see page 43)	Returns the OnGetThread (see page 54) event handler.
	GetOnClientError (see page 44)	Returns the OnClientError (see page 52) event handler.
	GetOnClientEvent (see page 44)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 44)	Returns the OnThreadEnd (see page 55) event handler.
	GetOnThreadStart (see page 45)	Returns the OnThreadStart (see page 55) event handler.
	GetServerType (see page 45)	Returns the ServerType (see page 49) property.
	GetThreadCacheSize (see page 45)	Returns the value of the ThreadCacheSize (see page 50) property.
	SetGetSocketEvent (see page 46)	Sets the OnGetSocket (see page 54) event handler.
	SetGetThreadEvent (see page 46)	Sets the OnGetThread (see page 54) event handler.
	SetOnClientError (see page 47)	Sets the OnClientError (see page 52) event handler.
	SetOnClientEvent (see page 47)	Sets the client event handlers of the associated TServerWinSocket (see page 120) object.
	SetOnThreadEnd (see page 47)	Sets the OnThreadEnd (see page 55) event handler.
	SetOnThreadStart (see page 48)	Sets the OnThreadStart (see page 55) event handler.
	SetServerType (see page 48)	Sets the ServerType (see page 49) property.
	SetThreadCacheSize (see page 49)	Sets the ThreadCacheSize (see page 50) property.

2.1.5.4.1 TCustomServerSocket.DoActivate Method

Opens or Closes the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); override;
```

C++

```
virtual __fastcall DoActivate(Boolean Value);
```

Description

DoActivate provides the underlying implementation of the Open (see page 19) and Close (see page 16) methods. When Value is true, DoActivate opens a listening connection to accept connection requests. When Value is false, DoActivate terminates the current listening connection and any connections to client sockets.

See Also

Active (see page 21)

Open (see page 19)

Close (see page 16)

2.1.5.4.2 TCustomServerSocket.GetGetSocketEvent Method

Returns the OnGetSocket (see page 54) event handler.

Pascal

```
function GetGetSocketEvent: TGetSocketEvent;
```

C++

```
__fastcall TGetSocketEvent GetGetSocketEvent();
```

Description

Applications cannot call this protected method. GetGetSocketEvent returns the OnGetSocket (see page 54) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

OnGetSocket (see page 54)

OnGetSocket (see page 137)

2.1.5.4.3 TCustomServerSocket.GetGetThreadEvent Method

Returns the OnGetThread (see page 54) event handler.

Pascal

```
function GetGetThreadEvent: TGetThreadEvent;
```

C++

```
__fastcall TGetThreadEvent GetGetThreadEvent();
```

Description

Applications cannot call this protected method. GetGetThreadEvent returns the OnGetThread (see page 54) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

OnGetThread (see page 54)

OnGetThread (see page 137)

2.1.5.4.4 TCustomServerSocket.GetOnClientError Method

Returns the OnClientError (see page 52) event handler.

Pascal

```
function GetOnClientError: TSocketErrorEvent;
```

C++

```
__fastcall TSocketErrorEvent GetOnClientError();
```

Description

Applications cannot call this protected method. GetOnClientError returns the OnClientError (see page 52) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

OnClientError (see page 52)

OnClientError (see page 135)

2.1.5.4.5 TCustomServerSocket.GetOnClientEvent Method

Provides indexed access to the various event handlers that respond to client events.

Pascal

```
function GetOnClientEvent(Index: Integer): TSocketNotifyEvent;
```

C++

```
__fastcall TSocketNotifyEvent GetOnClientEvent(int Index);
```

Description

Applications can't call this protected method. It is used internally to implement the event handlers that respond to client events.

See Also

OnClientRead (see page 53)

OnClientWrite (see page 53)

OnClientConnect (see page 51)

OnClientDisconnect (see page 52)

OnClientRead (see page 135)

OnClientWrite (see page 136)

OnClientConnect (see page 133)

OnClientDisconnect (see page 134)

2.1.5.4.6 TCustomServerSocket.GetOnThreadEnd Method

Returns the OnThreadEnd (see page 55) event handler.

Pascal

```
function GetOnThreadEnd: TThreadNotifyEvent;
```

C++

```
__fastcall TThreadNotifyEvent GetOnThreadEnd();
```

Description

Applications cannot call this protected method. GetOnThreadEnd returns the OnThreadEnd (see page 55) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

OnThreadEnd (see page 55)

OnThreadEnd (see page 138)

2.1.5.4.7 TCustomServerSocket.GetOnThreadStart Method

Returns the OnThreadStart (see page 55) event handler.

Pascal

```
function GetOnThreadStart: TThreadNotifyEvent;
```

C++

```
__fastcall TThreadNotifyEvent GetOnThreadStart();
```

Description

Applications cannot call this protected method. GetOnThreadStart returns the OnThreadStart (see page 55) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

OnThreadStart (see page 55)

OnThreadStart (see page 138)

2.1.5.4.8 TCustomServerSocket.GetServerType Method

Returns the ServerType (see page 49) property.

Pascal

```
function GetServerType: TServerType;
```

C++

```
__fastcall TServerType GetServerType();
```

Description

Applications cannot call this protected method. GetServerType returns the value of the ServerType (see page 49) property of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

ServerType (see page 49)

ServerType (see page 131)

2.1.5.4.9 TCustomServerSocket.GetThreadCacheSize Method

Returns the value of the ThreadCacheSize (see page 50) property.

Pascal

```
function GetThreadCacheSize: Integer;
```

C++

```
__fastcall int GetThreadCacheSize();
```

Description

Applications cannot call this protected method. GetThreadCacheSize returns the value of the ThreadCacheSize (see page 50) property of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

ThreadCacheSize (see page 50)

ThreadCacheSize (see page 132)

2.1.5.4.10 TCustomServerSocket.SetGetSocketEvent Method

Sets the OnGetSocket (see page 54) event handler.

Pascal

```
procedure SetGetSocketEvent(Value: TGetSocketEvent);
```

C++

```
__fastcall SetGetSocketEvent(TGetSocketEvent Value);
```

Description

Applications cannot call this protected method. SetGetSocketEvent sets the OnGetSocket (see page 54) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their OnGetSocket (see page 54) event.

See Also

OnGetSocket (see page 54)

OnGetSocket (see page 137)

2.1.5.4.11 TCustomServerSocket.SetGetThreadEvent Method

Sets the OnGetThread (see page 54) event handler.

Pascal

```
procedure SetGetThreadEvent(Value: TGetThreadEvent);
```

C++

```
__fastcall SetGetThreadEvent(TGetThreadEvent Value);
```

Description

Applications cannot call this protected method. SetGetThreadEvent sets the OnGetThread (see page 54) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their OnGetThread (see page 54) event.

See Also

OnGetThread (see page 54)

OnGetThread (see page 137)

2.1.5.4.12 TCustomServerSocket.SetOnClientError Method

Sets the OnClientError (see page 52) event handler.

Pascal

```
procedure SetOnClientError(Value: TSocketErrorEvent);
```

C++

```
__fastcall SetOnClientError(TSocketErrorEvent Value);
```

Description

Applications cannot call this protected method. SetOnClientError sets the OnClientError (see page 52) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their OnClientError (see page 52) event.

See Also

OnClientError (see page 52)

OnClientError (see page 135)

2.1.5.4.13 TCustomServerSocket.SetOnClientEvent Method

Sets the client event handlers of the associated TServerWinSocket (see page 120) object.

Pascal

```
procedure SetOnClientEvent(Index: Integer; Value: TSocketNotifyEvent);
```

C++

```
__fastcall SetOnClientEvent(int Index, TSocketNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnClientEvent sets the various event handlers that respond to events from the server endpoint of a client connection. Server socket components use TServerWinSocket (see page 120) to implement these events.

See Also

OnClientRead (see page 53)

OnClientWrite (see page 53)

OnClientConnect (see page 51)

OnClientDisconnect (see page 52)

OnClientRead (see page 135)

OnClientWrite (see page 136)

OnClientConnect (see page 133)

OnClientDisconnect (see page 134)

2.1.5.4.14 TCustomServerSocket.SetOnThreadEnd Method

Sets the OnThreadEnd (see page 55) event handler.

Pascal

```
procedure SetOnThreadEnd(Value: TThreadNotifyEvent);
```

C++

```
__fastcall SetOnThreadEnd(TThreadNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnThreadEnd sets the OnThreadEnd (see page 55) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their OnThreadEnd (see page 55) event.

See Also

OnThreadEnd (see page 55)

OnThreadEnd (see page 138)

2.1.5.4.15 TCustomServerSocket.SetOnThreadStart Method

Sets the OnThreadStart (see page 55) event handler.

Pascal

```
procedure SetOnThreadStart(Value: TThreadNotifyEvent);
```

C++

```
__fastcall SetOnThreadStart(TThreadNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnThreadStart sets the OnThreadEnd (see page 55) event handler of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their OnThreadEnd (see page 55) event.

See Also

OnThreadStart (see page 55)

OnThreadEnd (see page 138)

2.1.5.4.16 TCustomServerSocket.SetServerType Method

Sets the ServerType (see page 49) property.

Pascal

```
procedure SetServerType(Value: TServerType);
```

C++

```
__fastcall SetServerType(TServerType Value);
```

Description

Applications cannot call this protected method. SetServerType sets the ServerType (see page 49) property of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their ServerType (see page 49) property.

See Also

ServerType (see page 49)

ServerType (see page 131)

2.1.5.4.17 TCustomServerSocket.SetThreadCacheSize Method

Sets the ThreadCacheSize (see page 50) property.

Pascal

```
procedure SetThreadCacheSize(Value: Integer);
```

C++

```
__fastcall SetThreadCacheSize(int Value);
```

Description

Applications cannot call this protected method. SetThreadCacheSize sets the ThreadCacheSize (see page 50) property of the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 120) to implement their ThreadCacheSize (see page 50) property.

See Also

ThreadCacheSize (see page 50)

ThreadCacheSize (see page 132)

2.1.5.5 TCustomServerSocket Properties

The properties of the TCustomServerSocket class are listed here.

Protected Properties

	Name	Description
	ServerType (see page 49)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	ThreadCacheSize (see page 50)	Specifies the maximum number of threads that can be reused for new client connections.

2.1.5.5.1 TCustomServerSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the server socket. When ServerType is stThreadBlocking, the execution of the connection thread is suspended while reading or writing until all information has been transferred over the connection. The thread for each connection generates OnClientRead (see page 53) or OnClientWrite (see page 53) events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over the socket connections asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default. OnClientRead (see page 53) or OnClientWrite (see page 53) events occur when the client socket on the other end of one of the connections tries to send or receive information over the connection.

Use a non-blocking socket when the socket needs to synchronize reading and writing with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient... event handlers contain thread-safe code.

See Also

OnClientRead (see page 53)

OnClientWrite (see page 53)

TServerClientThread (see page 95)

2.1.5.5.2 TCustomServerSocket.ThreadCacheSize Property

Specifies the maximum number of threads that can be reused for new client connections.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType (see page 49) is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New (see page 3619) connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

See Also

ServerType (see page 49)

TServerClientThread (see page 95)

ActiveThreads (see page 130)

IdleThreads (see page 131)

2.1.5.6 TCustomServerSocket Events

The events of the TCustomServerSocket class are listed here.

Protected Events

	Name	Description
	OnClientConnect (see page 51)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 52)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 52)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 53)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 53)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 54)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to represent the server endpoint of a connection to a client socket.

	OnGetThread (see page 54)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnThreadEnd (see page 55)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 55)	Occurs when the execution thread for a connection to a client socket starts up.

2.1.5.6.1 TCustomServerSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the server socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write (see page 3707) an OnClientConnect event handler to take specific action when a client socket completes the socket connection to the server socket. For example, the socket may start reading or writing over the connection in an OnClientConnect event handler.

The order of server socket events leading up to OnClientConnect is as follows:

1An OnListen (see page 61) event occurs just before the server socket is opened for listening.

2The server socket receives client requests in a listening queue. The server socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The server socket generates an OnGetSocket (see page 54) event, passing in the Windows socket handle. If a TServerClientWinSocket (see page 104) object for the server endpoint of the new connection is not created in an OnGetSocket (see page 54) event handler, the server socket creates one. The TServerWinSocket (see page 120) object continues to listen for other clients.

4An OnAccept (see page 59) event occurs, using the new TServerClientWinSocket (see page 104) object.

5If ServerType (see page 49) is stThreadBlocking and no thread is available in the cache, an OnGetThread (see page 54) event occurs. If the OnGetThread (see page 54) event handler does not create a thread, the server socket creates a TServerClientThread (see page 95).

6If ServerType (see page 49) is stThreadBlocking, an OnThreadStart (see page 55) event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket (see page 104) object and an OnClientConnect event occurs.

Note: If ServerType (see page 49) is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientConnect event handler for TServerSocket (see page 108) is also set when setting the OnClientConnect event handler of the associated TServerWinSocket (see page 120).

See Also

OnAccept (see page 59)

OnGetSocket (see page 54)

OnGetThread (see page 54)

OnListen (see page 61)

OnThreadStart (see page 55)

ServerType (see page 49)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

GetClientThread (see page 127)

2.1.5.6.2 TCustomServerSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write (see page 3707) an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client connection does not close the server socket. The server socket remains open and listening for client requests on its listening connection.

The TServerClientWinSocket (see page 104) that describes the server endpoint of the client connection is freed after OnClientDisconnect. If ServerType (see page 49) is stThreadBlocking, OnThreadEnd (see page 55) occurs after OnClientDisconnect.

Note: If ServerType (see page 49) is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientDisconnect event handler for TServerSocket (see page 108) is also set when setting the OnClientDisconnect event handler of the associated TServerWinSocket (see page 120).

See Also

OnThreadEnd (see page 55)

ServerType (see page 49)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

GetClientThread (see page 127)

2.1.5.6.3 TCustomServerSocket.OnClientError Event

Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write (see page 3707) an OnClientError event handler to respond to errors that arise with a connection to an individual client. Set the ErrorCode parameter to 0 if the OnClientError event handler successfully deals with the error condition to prevent an ESocketError (see page 13) from being raised.

Note: If ServerType (see page 49) is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientError event handler for TServerSocket (see page 108) is also set when setting the OnClientError event handler of the associated TServerWinSocket (see page 120).

See Also

ESocketError (see page 13)

ServerType (see page 49)

TServerClientWinSocket (see page 104)

GetClientThread (see page 127)

2.1.5.6.4 TCustomServerSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write (see page 3707) an OnClientRead event handler to read from the socket connection. If the ServerType (see page 49) property is stThreadBlocking, use a TWinSocketStream (see page 138) object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, use the methods of the Socket parameter to perform the actual reading.

Note: If ServerType (see page 49) is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 49)

ReceiveBuf (see page 77)

ReceiveText (see page 78)

TServerClientWinSocket (see page 104)

GetClientThread (see page 127)

TWinSocketStream (see page 138)

2.1.5.6.5 TCustomServerSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write (see page 3707) an OnClientWrite event handler to write to the socket connection. If the ServerType (see page 49) property is stThreadBlocking, use a TWinSocketStream (see page 138) object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, use the methods of the Socket parameter to perform the actual writing.

Note: If ServerType (see page 49) is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 49)

SendBuf (see page 78)

SendStream (see page 79)

SendText (see page 80)

GetClientThread (see page 127)

TWinSocketStream (see page 138)

2.1.5.6.6 TCustomServerSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to represent the server endpoint of a connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write (see page 3707) an OnGetSocket event handler to create a specialized descendant of TServerClientWinSocket (see page 104) for the server socket component to use. Return the new TServerClientWinSocket (see page 104) object in the ClientSocket parameter. The Sender parameter is the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection.

See Also

TServerClientWinSocket (see page 104)

Create (see page 106)

TServerWinSocket (see page 120)

2.1.5.6.7 TCustomServerSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write (see page 3707) an OnGetThread event handler to create a specialized descendant of TServerClientThread (see page 95) for the connection to the client socket. Return the new TServerClientThread (see page 95) object in the SocketThread parameter.

Most applications that use thread-blocking server components will want to provide an OnGetThread event handler and implement a TServerClientThread (see page 95) that handles its own reading and writing in a thread-safe manner rather than relying on the default TServerClientThread (see page 95) which triggers OnClientRead (see page 53) and OnClientWrite (see page 53) events. This is because the OnClientRead (see page 53) and OnClientWrite (see page 53) event handlers reside on the server socket, which is in global memory.

The Sender parameter is the TServerWinSocket (see page 120) object that describes the server endpoint of the listening connection. The ClientSocket parameter is the TServerClientWinSocket (see page 104) object that describes the server endpoint of the connection to the client socket that is about to be formed.

See Also

ServerType (see page 49)

TServerClientThread (see page 95)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.5.6.8 TCustomServerSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write (see page 3707) an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect (see page 52) event.

The Sender parameter is the TServerWinSocket (see page 120) that describes the server endpoint of the listening connection. The Thread parameter is the thread that is finishing up.

See Also

OnClientDisconnect (see page 52)

TServerWinSocket (see page 120)

2.1.5.6.9 TCustomServerSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write (see page 3707) an OnThreadStart to initialize the TServerClientThread (see page 95) for the connection to a single client socket. The Sender parameter is the TServerWinSocket (see page 120) that describes the server endpoint of the listening connection. The Thread parameter is the thread that is about to start execution.

See Also

TServerClientThread (see page 95)

TServerWinSocket (see page 120)

2.1.6 TCustomSocket Class

TCustomSocket is the base class for socket components.

Class Hierarchy

Pascal

```
TCustomSocket = class(TAbstractSocket);
```

C++

```
class TCustomSocket : public TAbstractSocket;
```

File

ScktComp

Description

Override TCustomSocket to create a socket component that can be assigned event handlers for the events and error conditions that occur. In addition to the properties and methods introduced by TAbstractSocket (see page 14) that enable an application to work with Windows sockets, TCustomSocket introduces several events that can be used by applications.

Do not create instances of TCustomSocket. Use a descendant of TCustomSocket to add the ability to communicate with other machines using TCP/IP. To create a socket that initiates the connection with another machine, use TClientSocket (see page 24). To create a socket that responds to requests for connections from other machines, use TServerSocket (see page 108).

See Also

TClientSocket (see page 24)

TCustomWinSocket (see page 64)

TServerSocket (see page 108)

2.1.6.1 TCustomSocket Members

The following tables list the members exposed by TCustomSocket.

Protected Events

	Name	Description
	OnAccept (see page 59)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnConnect (see page 60)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 60)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 61)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 61)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnListen (see page 61)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 62)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 63)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 63)	Occurs when a client socket should write information to the socket connection.

Protected Methods

	Name	Description
	DoActivate (see page 16)	Provides the prototype of a method to open or close the socket connection.
	Error (see page 58)	Generates an OnError (see page 61) event.
	Event (see page 58)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetService (see page 21)	Sets the Service (see page 23) property.

Protected Properties

	Name	Description
	Active (see page 21)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 22)	Specifies the IP address of the server system.
	Host (see page 22)	Specifies an alias for the IP address of the server system.
	Port (see page 23)	Specifies the ID number that identifies the server socket connection.
	Service (see page 23)	Specifies the name of the service for which the socket connection is used.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
	Open (see page 19)	Opens the socket connection.

2.1.6.2 TCustomSocket Methods

The methods of the TCustomSocket class are listed here.

Protected Methods

	Name	Description
	Error (see page 58)	Generates an OnError (see page 61) event.
	Event (see page 58)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.

2.1.6.2.1 TCustomSocket.Error Method

Generates an OnError (see page 61) event.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
override;
```

C++

```
virtual __fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

Applications cannot call Error. It responds to error conditions by calling the OnError (see page 61) event handler if it is assigned. Override Error to add class-specific error processing or to block the OnError (see page 61) event.

The Socket parameter indicates the Windows socket object which encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Setting this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnError (see page 61)

2.1.6.2.2 TCustomSocket.Event Method

Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); override;
```

C++

```
virtual __fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent);
```

Description

Applications cannot call Event. It is called automatically when various events occur. Override Event to introduce class-specific responses when certain events occur or to prevent the socket from calling the associated event handler.

The Socket parameter indicates the Windows socket object that calls Event to indicate when specific events occur.

The SocketEvent parameter indicates the event that occurred.

See Also

OnAccept (see page 59)

OnConnect (see page 60)

OnConnecting (see page 60)

OnDisconnect (see page 61)

OnListen (see page 61)

OnLookup (see page 62)

OnRead (see page 63)

OnWrite (see page 63)

2.1.6.3 TCustomSocket Events

The events of the TCustomSocket class are listed here.

Protected Events

	Name	Description
	OnAccept (see page 59)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnConnect (see page 60)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 60)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 61)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 61)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnListen (see page 61)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 62)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 63)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 63)	Occurs when a client socket should write information to the socket connection.

2.1.6.3.1 TCustomSocket.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnAccept;
```

Description

Write (see page 3707) an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that will be used in the server endpoint of the connection. The port number, and possibly the IP address, will differ from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect (see page 60) event occurs for the client socket.

See Also

OnConnect (see page 60)

OnListen (see page 61)

2.1.6.3.2 TCustomSocket.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write (see page 3707) an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

When a client socket opens a connection, the following events occur:

1An OnLookup (see page 62) event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting (see page 60) event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnAccept (see page 59)

OnConnecting (see page 60)

OnLookup (see page 62)

2.1.6.3.3 TCustomSocket.OnConnecting Event

Occurs for a client socket after the server socket has been located, but before the connection is established.

Pascal

```
property OnConnecting: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnecting;
```

Description

Write (see page 3707) an OnConnecting event handler for a client socket to take specific action just before the connection to a server socket is established. This is the first opportunity to obtain the actual port and IP address of the server endpoint of the connection that is about to form.

When a client socket opens a connection, the following events occur:

1An OnLookup (see page 62) event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect (see page 60) event occurs after the connection is established.

See Also

OnConnect (see page 60)

OnLookup (see page 62)

2.1.6.3.4 TCustomSocket.OnDisconnect Event

Occurs just before a client socket closes the connection to a server socket.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write (see page 3707) an OnDisconnect event handler to take specific action when the connection to a server socket is about to be terminated. OnDisconnect occurs after the value of the Active (see page 21) property is set to false, but before the actual connection is closed.

See Also

Active (see page 21)

Close (see page 16)

OnConnect (see page 60)

2.1.6.3.5 TCustomSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write (see page 3707) an OnError event handler to respond to errors that arise with the socket connection. Set the ErrorCode parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError (see page 13) from being raised.

See Also

ESocketError (see page 13)

2.1.6.3.6 TCustomSocket.OnListen Event

Occurs just before a server socket is opened for listening.

Pascal

```
property OnListen: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnListen;
```

Description

Write (see page 3707) an OnListen event handler for a server socket to take specific action just before the socket is opened for listening. OnListen occurs after Address (see page 22) and Port (see page 23) have been bound to the socket connection, but before it is opened. This is the last opportunity to make changes to the socket endpoint before it is opened for listening. Use the SocketHandle property of the Socket parameter for Windows API calls that change the socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. The connection to a client socket is completed when a request from the queue is accepted.

See Also

Accept (see page 68)

Address (see page 22)

Port (see page 23)

2.1.6.3.7 TCustomSocket.OnLookup Event

Occurs when a client socket is about to look up the server socket with which it wants to connect.

Pascal

```
property OnLookup: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnLookup;
```

Description

Write (see page 3707) an OnLookup event handler for a client socket to take specific action just before attempting to locate a server socket. This is the first opportunity to make Windows API calls that affect the client properties of the socket, such as specifying a particular port number. Use the SocketHandle property of the Socket parameter for Windows API calls.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting (see page 60) event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect (see page 60) event occurs after the connection is established.

Note: Changing the Address (see page 22), Host (see page 22), Port (see page 23), or Service (see page 23) properties of socket component in an OnLookup event handler has no effect on the address or port used to locate a server socket. These properties must be correct before the Open (see page 19) method is called.

See Also

Address (see page 22)

Host (see page 22)

OnConnect (see page 60)

OnConnecting (see page 60)

Open (see page 19)

Port (see page 23)

Service (see page 23)

2.1.6.3.8 TCustomSocket.OnRead Event

Occurs when a client socket should read information from the socket connection.

Pascal

```
property OnRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnRead;
```

Description

Write (see page 3707) an OnRead event handler to read from the socket connection. If the socket is a blocking socket, use a TWinSocketStream (see page 138) object to read from the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual reading.

Note: Non-blocking sockets do not always receive an OnRead event for the last bit of data passed over the connection. When using a non-blocking socket, check for any unread data in the OnDisconnect (see page 61) event to make sure that everything is handled.

See Also

ReceiveBuf (see page 77)

ReceiveText (see page 78)

TWinSocketStream (see page 138)

OnDisconnect (see page 61)

2.1.6.3.9 TCustomSocket.OnWrite Event

Occurs when a client socket should write information to the socket connection.

Pascal

```
property OnWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnWrite;
```

Description

Write (see page 3707) an OnWrite to write from the socket connection. If the socket is a blocking socket, use a TWinSocketStream (see page 138) object to write to the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual writing.

See Also

SendBuf (see page 78)

SendStream (see page 79)

SendStreamThenDrop (see page 79)

SendText (see page 80)

TWinSocketStream (see page 138)

2.1.7 TCustomWinSocket Class

TCustomWinSocket is the base class for all Windows socket objects.

Class Hierarchy

Pascal

```
TCustomWinSocket = class;
```

C++

```
class TCustomWinSocket;
```

File

ScktComp

Description

TCustomWinSocket introduces properties, events, and methods to describe an endpoint in a Windows socket connection. Descendants of TCustomWinSocket are used by socket components to manage the Windows socket API calls and to store information about a socket communication link.

A Windows socket encapsulates a set of communication protocols to allow the application to connect to other machines for reading or writing information. Windows sockets provide connections based on the TCP/IP protocol. They also allow connections that use the Xerox Network System (see page 3159) (XNS), Digital's DECnet protocol, or Novell's IPX/SPX family. Sockets (see page 1367) allow an application to form connections to other machines without being concerned with the details of the actual networking software.

Descendants of TCustomWinSocket represent different endpoints in socket connections. TClientWinSocket (see page 35) represents the client endpoint of a socket communication link to a server socket. TServerWinSocket (see page 120) represents the server endpoint of a listening connection. TServerClientWinSocket (see page 104) represents the server endpoint of a socket communication link to a client socket.

See Also

TAbstractSocket (see page 14)

TClientWinSocket (see page 35)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.7.1 TCustomWinSocket Members

The following tables list the members exposed by TCustomWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 68)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 70)	Opens a listening connection.
	DoOpen (see page 71)	Opens a connection to a remote socket.
	Error (see page 71)	Generates an OnErrorEvent (see page 89) event.
	Event (see page 72)	Triggers an OnSocketEvent (see page 90) event.
	InitSocket (see page 72)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 81)	Sets the ASyncStyles (see page 83) property.

Public Events

	Name	Description
	OnErrorEvent (see page 89)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 90)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
V	Accept (see page 68)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 69)	Shuts down the socket connection if it is open.
V	Connect (see page 69)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 66)	Creates an instance of TCustomWinSocket (see page 64) from a Windows socket handle.
V	DefaultHandler (see page 70)	Processes message records.
V	Destroy (see page 67)	Destroys an instance of TCustomWinSocket (see page 64).
V	Disconnect (see page 70)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 73)	Opens a listening connection for a server socket.
	Lock (see page 74)	Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.
	LookupName (see page 74)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 75)	Returns the port number associated with a specific service.
	Open (see page 75)	Opens a connection to a remote socket.
V	Read (see page 76)	Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 77)	Reads up to Count bytes from the socket connection into the Buf parameter.
	ReceiveLength (see page 77)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 78)	Reads a string from the socket connection.
	SendBuf (see page 78)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection.
	SendStreamThenDrop (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 80)	Writes the string S to the socket connection.
	Unlock (see page 81)	Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.
V	Write (see page 81)	Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	Addr (see page 82)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 83)	Determines which asynchronous events the socket can receive.
R	Connected (see page 83)	Indicates whether the socket connection is open and available for communication with other machines.

	Data (see page 84)	Points to application-specific data associated with the socket.
R	Handle (see page 84)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 85)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 85)	Specifies the name of the local system.
R	LocalPort (see page 86)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 86)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 87)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 87)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 88)	Specifies the name of the remote system.
R	RemotePort (see page 88)	Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.
R	SocketHandle (see page 89)	Specifies the Windows handle for the socket.

2.1.7.2 TCustomWinSocket.Create Constructor

Creates an instance of TCustomWinSocket (see page 64) from a Windows socket handle.

Pascal

```
constructor Create(ASocket: TSocket);
```

C++

```
__fastcall TCustomWinSocket(TSocket ASocket);
```

Description

Call Create to create a Windows socket object. Most Windows socket objects are created automatically by the socket component that uses them. Applications may create their own Windows socket objects in an OnGetSocket event handler for a server socket component.

After calling the inherited constructor, Create

Makes sure that Winsock.dll is initialized.

Allocates helper objects to manage multithreading issues.

Initializes ASyncStyles (see page 83) to [asRead, asWrite, asConnect, asClose]

Initializes the SocketHandle (see page 89) property to the ASocket parameter and sets the Connected (see page 83) property to reflect whether ASocket is the handle of a valid open Windows socket.

Initializes the Addr (see page 82) property.

See Also

Addr (see page 82)

ASyncStyles (see page 83)

Connected (see page 83)

SocketHandle (see page 89)

OnGetSocket (see page 54)

2.1.7.3 TCustomWinSocket.Destroy Destructor

Destroys an instance of TCustomWinSocket (see page 64).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWinSocket();
```

Description

Most applications do not need to explicitly free Windows socket objects. They are freed by the socket components that use them.

See Also

System::TObject::Free (see page 3372)

TCustomSocket (see page 56)

2.1.7.4 TCustomWinSocket Methods

The methods of the TCustomWinSocket class are listed here.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 68)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 70)	Opens a listening connection.
	DoOpen (see page 71)	Opens a connection to a remote socket.
	Error (see page 71)	Generates an OnErrorEvent (see page 89) event.
	Event (see page 72)	Triggers an OnSocketEvent (see page 90) event.
	InitSocket (see page 72)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 81)	Sets the ASyncStyles (see page 83) property.

Public Methods

	Name	Description
	Accept (see page 68)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 69)	Shuts down the socket connection if it is open.
	Connect (see page 69)	Provides the interface for a method that responds to connection notifications from client sockets.
	DefaultHandler (see page 70)	Processes message records.
	Disconnect (see page 70)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 73)	Opens a listening connection for a server socket.
	Lock (see page 74)	Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.
	LookupName (see page 74)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 75)	Returns the port number associated with a specific service.
	Open (see page 75)	Opens a connection to a remote socket.
	Read (see page 76)	Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 77)	Reads up to Count bytes from the socket connection into the Buf parameter.
	ReceiveLength (see page 77)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 78)	Reads a string from the socket connection.
	SendBuf (see page 78)	Writes Count bytes to the socket connection from the Buf parameter.

	SendStream (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection.
	SendStreamThenDrop (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 80)	Writes the string S to the socket connection.
	Unlock (see page 81)	Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.
	Write (see page 81)	Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

2.1.7.4.1 TCustomWinSocket.Accept Method

Provides the interface for a method that accepts a connection to a client socket.

Pascal

```
procedure Accept(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Accept(TSocket Socket);
```

Description

Accept is called automatically in response to notifications that a client socket is requesting a connection. The Socket parameter is the Windows socket handle for the socket that receives the notification.

The Accept method for TCustomWinSocket (see page 64) does nothing with the notification. Descendants of TCustomWinSocket (see page 64) that represent listening server sockets override this method to accept the connection to the client socket.

Accept is only called if the ASyncStyles (see page 83) property includes asAccept.

See Also

ASyncStyles (see page 83)

2.1.7.4.2 TCustomWinSocket.AsyncInitSocket Method

Looks up information or forms socket connections asynchronously.

Pascal

```
procedure AsyncInitSocket(const Name: string; const Address: string; const Service: string;
Port: Word; QueueSize: Integer; Client: Boolean);
```

C++

```
__fastcall AsyncInitSocket(const UnicodeString Name, const UnicodeString Address, const
UnicodeString Service, Word Port, int QueueSize, Boolean Client);
```

Description

AsyncInitSocket is used internally to open a socket connection in non-blocking sockets. It is called by the Open (see page 75) or Listen (see page 73) method when that method's Block parameter is false.

The Name parameter is the host name for the socket. The Address parameter is the IP address. The Service parameter is the service for which the socket is to used. The Port parameter is the port number for the socket. The QueueSize parameter indicates the number of client requests a listening connection can hold while waiting to form connections. The Client parameter indicates whether the socket address structure is to be used by a client socket to describe the destination of a connection or by a server socket to describe the listening connection.

See Also

ASyncStyles (see page 83)

ServerType (see page 131)

ClientType (see page 38)

Addr (see page 82)

Listen (see page 73)

LookupName (see page 74)

LookupService (see page 75)

Open (see page 75)

RemoteAddr (see page 87)

Address (see page 22)

Host (see page 22)

Port (see page 23)

Service (see page 23)

2.1.7.4.3 TCustomWinSocket.Close Method

Shuts down the socket connection if it is open.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to terminate an open socket connection. Close triggers an OnSocketEvent (see page 90) of type seDisconnect before the connection is shut down. If the Windows socket is a listening server socket, Close shuts down all open connections to client sockets before shutting down the listening connection.

See Also

Connected (see page 83)

OnSocketEvent (see page 90)

2.1.7.4.4 TCustomWinSocket.Connect Method

Provides the interface for a method that responds to connection notifications from client sockets.

Pascal

```
procedure Connect(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Connect(TSocket Socket);
```

Description

Connect is called automatically in response to notifications that the client socket has successfully completed a connection to a

server socket. The Socket parameter is the Windows socket handle for the socket that receives the notification.

The Connect method for TCustomWinSocket (see page 64) does nothing with the notification. Descendants of TCustomWinSocket (see page 64) that represent client sockets override this method to respond to connection notifications.

Connect is only called if the ASyncStyles (see page 83) property includes asConnect.

See Also

ASyncStyles (see page 83)

2.1.7.4.5 TCustomWinSocket.DefaultHandler Method

Processes message records.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

DefaultHandler overrides the inherited method in order to process all messages that are sent to the Windows socket object. DefaultHandler passes the messages to the Windows CallWindowProc function.

See Also

TMessage

2.1.7.4.6 TCustomWinSocket.Disconnect Method

Shuts down the socket connection represented by a Windows socket handle.

Pascal

```
procedure Disconnect(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Disconnect(TSocket Socket);
```

Description

Disconnect is called by the Close (see page 69) method to terminate an individual socket connection.

Disconnect calls the Lock (see page 74) method to make sure the method is thread-safe. Then, it generates an OnSocketEvent (see page 90) of type seDisconnect. After the OnSocketEvent (see page 90), Disconnect closes the connection. Finally, it calls Unlock (see page 81) to end the critical section started by Lock (see page 74).

See Also

Close (see page 69)

Lock (see page 74)

OnSocketEvent (see page 90)

Unlock (see page 81)

2.1.7.4.7 TCustomWinSocket.DoListen Method

Opens a listening connection.

Pascal

```
procedure DoListen(QueueSize: Integer);
```

C++

```
__fastcall DoListen(int QueueSize);
```

Description

The socket uses DoListen internally to open a listening connection with a queue that can hold QueueSize client connection requests. DoListen handles those tasks that are common to opening a listening connection synchronously or asynchronously.

Do not call DoListen to open a listening connection. Instead, call the public Listen (see page 73) method, which orchestrates the opening of a connection either synchronously or asynchronously, depending on the socket type.

See Also

Listen (see page 73)

2.1.7.4.8 TCustomWinSocket.DoOpen Method

Opens a connection to a remote socket.

Pascal

```
procedure DoOpen;
```

C++

```
__fastcall DoOpen();
```

Description

The socket uses DoOpen internally to open a connection to a remote socket. DoOpen handles those tasks that are common to establishing a connection synchronously or asynchronously.

Do not call DoOpen to open a connection. Instead, call the public Open (see page 75) method, which orchestrates the opening of a connection either synchronously or asynchronously, depending on the socket type.

See Also

Open (see page 75)

2.1.7.4.9 TCustomWinSocket.Error Method

Generates an OnErrorEvent (see page 89) event.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
dynamic;
```

C++

```
__fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

Error is called automatically when the Windows socket object receives error notifications. It generates the OnErrorEvent (see page 89) event. When overriding this method, be sure to call the inherited method, because socket components rely on the OnErrorEvent (see page 89) event for their own error handling.

The Socket parameter indicates the Windows socket object that encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Changing this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnErrorEvent (see page 89)

2.1.7.4.10 TCustomWinSocket.Event Method

Triggers an OnSocketEvent (see page 90) event.

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); dynamic;
```

C++

```
__fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent);
```

Description

Event is called automatically when the Windows socket object receives notifications or when it performs certain actions. It generates the OnSocketEvent (see page 90) event. When overriding this method, be sure to call the inherited method, because socket components rely on the OnSocketEvent (see page 90) event to generate many of their own events. The `Socket` parameter indicates the Windows socket that generates or receives notification of the event. The `SocketEvent` parameter indicates the event that occurred.

See Also

Connected (see page 83)

OnSocketEvent (see page 90)

2.1.7.4.11 TCustomWinSocket.InitSocket Method

Generates a windows Internet socket address structure from a description of the desired socket port.

Pascal

```
function InitSocket(const Name: string; const Address: string; const Service: string; Port:
Word; Client: Boolean): TSockAddrIn;
```

C++

```
__fastcall TSockAddrIn InitSocket(const UnicodeString Name, const UnicodeString Address, const
UnicodeString Service, Word Port, Boolean Client);
```

Description

Applications can not call InitSocket. It is called by the Open (see page 75) or Listen (see page 73) method to obtain a Windows Internet socket address structure for the parameters obtained from a socket component.

The Name parameter is the host name for the socket.The Address parameter is the IP address. The Service parameter is the service for which the socket is to used. The Port parameter is the port number for the socket. The Client parameter indicates whether the socket address structure is to be used by a client socket to describe the destination of a connection or by a server socket to describe the listening connection.

The host portion of the Windows Internet socket address is obtained from the host name if it is given. Otherwise the Address parameter is used. If Client is true, either the Name or the Address parameter must be specified. If Client is false, they may both be left blank to specify a server that listens on multiple addresses.

If port number for the Windows Internet socket address is obtained from the Service parameter if it is given. Otherwise, the Port parameter is used. One of these two parameters must be specified.

See Also

Addr (see page 82)

Listen (see page 73)

LookupName (see page 74)

LookupService (see page 75)

Open (see page 75)

RemoteAddr (see page 87)

Address (see page 22)

Host (see page 22)

Port (see page 23)

Service (see page 23)

AsyncInitSocket (see page 68)

2.1.7.4.12 TCustomWinSocket.Listen Method

Opens a listening connection for a server socket.

Pascal

```
procedure Listen(const Name: string; const Address: string; const Service: string; Port: Word;
QueueSize: Integer; Block: Boolean = True);
```

C++

```
__fastcall Listen(const UnicodeString Name, const UnicodeString Address, const UnicodeString
Service, Word Port, int QueueSize, Boolean Block = True);
```

Description

Server socket components call Listen to open a listening connection.

Listen creates the Windows socket that will make the listening connection, and binds the Windows Internet socket address derived from the parameters to the socket. Listen then generates an OnSocketEvent (see page 90) of type seListen. Finally, Listen opens the socket as a listening connection with a queue that can hold QueueSize client requests, setting the Connected (see page 83) property to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the server socket component.

QueueSize indicates how many client requests the listening connection can hold. TServerSocket (see page 108) sets the QueueSize to 5.

Block indicates whether the socket can look up the information it needs to establish a connection asynchronously. When Block is true, the socket blocks execution for each lookup instead of retrieving information about the connection using asynchronous notifications.

See Also

Connected (see page 83)

InitSocket (see page 72)

OnSocketEvent (see page 90)

Address (see page 22)

Host (see page 22)

Port (see page 23)

Service (see page 23)

TServerSocket (see page 108)

2.1.7.4.13 TCustomWinSocket.Lock Method

Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.

Pascal

```
procedure Lock;
```

C++

```
__fastcall Lock();
```

Description

Call Lock before beginning a section of code that is not thread-safe. Call Unlock (see page 81) when the critical section of code is completed. Unless absolutely necessary, do not use Lock to lock lengthy operations such as reading and writing over a blocking connection. Locking lengthy operations can severely impact performance, because all execution threads in the application that use the Windows socket object must wait until Unlock (see page 81) is called.

See Also

TThread

Unlock (see page 81)

2.1.7.4.14 TCustomWinSocket.LookupName Method

Generates the portion of a Windows Internet socket address structure that describes the host.

Pascal

```
function LookupName(const name: string): TInAddr;
```

C++

```
__fastcall TInAddr LookupName(const UnicodeString name);
```

Description

Call LookupName to obtain the Internet address associated with the system identified by the name parameter. LookupName is used by InitSocket (see page 72) to generate the portion of the Windows Internet socket address structure that identifies the host.

See Also

InitSocket (see page 72)

Host (see page 22)

2.1.7.4.15 TCustomWinSocket.LookupService Method

Returns the port number associated with a specific service.

Pascal

```
function LookupService(const service: string): Integer;
```

C++

```
__fastcall int LookupService(const UnicodeString service);
```

Description

Call LookupService to obtain the standard port number for the service named by the service parameter. Windows provides a number of standard service names such as ftp, http, finger, or time. Each standard service is associated, by convention, with a specific port number. These standard port numbers allow client sockets to indicate the desired service by requesting a specific port number. They allow server sockets to listen on an expected port number for the service offered. Servers can specify additional services and their associated ports in a SERVICES file. For more information on the SERVICES file, see the Microsoft documentation for Windows sockets.

InitSocket (see page 72) calls LookupService to obtain the port number for the Service specified by a socket component.

See Also

InitSocket (see page 72)

Service (see page 23)

2.1.7.4.16 TCustomWinSocket.Open Method

Opens a connection to a remote socket.

Pascal

```
procedure Open(const Name: string; const Address: string; const Service: string; Port: Word;
Block: Boolean = True);
```

C++

```
__fastcall Open(const UnicodeString Name, const UnicodeString Address, const UnicodeString
Service, Word Port, Boolean Block = True);
```

Description

Client socket components call Open to open a connection to a server socket.

Open creates the Windows socket that will connect to the server socket, and generates an OnSocketEvent (see page 90) of type seLookup. After the OnSocketEvent (see page 90), Open binds the Windows Internet socket address derived from the parameters to the socket, locating the server socket. Open then generates an OnSocketEvent (see page 90) of type seConnecting. When the server socket accepts the connection, Open completes the connection to the server socket. Then it

generates an OnSocketEvent (see page 90) of type seConnect. After the OnSocketEvent (see page 90), the Connected (see page 83) property is set to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the client socket component.

Block indicates whether the socket can look up the information it needs to establish a connection asynchronously. When Block is true, the socket blocks execution for each lookup instead of retrieving information about the connection using asynchronous notifications.

See Also

Connected (see page 83)

InitSocket (see page 72)

OnSocketEvent (see page 90)

Address (see page 22)

Host (see page 22)

Port (see page 23)

Service (see page 23)

TClientSocket (see page 24)

2.1.7.4.17 TCustomWinSocket.Read Method

Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.

Pascal

```
procedure Read(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Read(TSocket Socket);
```

Description

Read is called in response to asynchronous notifications that the socket connection is ready for reading. The Windows socket can then read from the connection in the OnSocketEvent (see page 90) event handler or the socket component can read from the connection in an OnRead or OnClientRead event handler. The event handler can use the ReceiveBuf (see page 77) method or the ReceiveText (see page 78) method to read the information from the connection.

Note: Read is only called for asynchronous read notifications in a non-blocking socket. Blocking sockets must use a TWinSocketStream (see page 138) object for reading. The TWinSocketStream (see page 138) object waits for the remote socket to be ready before transferring information.

See Also

ASyncStyles (see page 83)

OnSocketEvent (see page 90)

ReceiveBuf (see page 77)

ReceiveText (see page 78)

OnRead (see page 63)

OnClientRead (see page 53)

TWinSocketStream (see page 138)

2.1.7.4.18 TCustomWinSocket.ReceiveBuf Method

Reads up to Count bytes from the socket connection into the Buf parameter.

Pascal

```
function ReceiveBuf(var Buf; Count: Integer): Integer;
```

C++

```
__fastcall int ReceiveBuf( Buf, int Count);
```

Description

Use ReceiveBuf to read from the socket connection in the OnSocketEvent (see page 90) event handler of a Windows socket object or in the OnRead or OnClientRead event handler of a socket component. ReceiveBuf returns the number of bytes actually read. If no bytes are read, ReceiveBuf returns –1.

ReceiveBuf only works in response to a read notification to a non-blocking windows socket. Blocking sockets must use a TWinSocketStream (see page 138) for reading. The TWinSocketStream (see page 138) object waits for the remote socket to be ready before transferring information.

Note: While the ReceiveLength (see page 77) method can return an estimate of the size of buffer required to retrieve information from the socket, the number of bytes it returns is not necessarily accurate.

See Also

ASyncStyles (see page 83)

OnSocketEvent (see page 90)

ReceiveLength (see page 77)

ReceiveText (see page 78)

OnRead (see page 63)

OnClientRead (see page 53)

TWinSocketStream (see page 138)

2.1.7.4.19 TCustomWinSocket.ReceiveLength Method

Returns the number of bytes ready to be sent over the socket connection.

Pascal

```
function ReceiveLength: Integer;
```

C++

```
__fastcall int ReceiveLength();
```

Description

Call ReceiveLength to determine the amount of information to read over the socket connection in response to an asynchronous read notification.

Note: ReceiveLength is not guaranteed to be accurate for streaming socket connections.

See Also

ASyncStyles (see page 83)

ReceiveBuf (see page 77)

2.1.7.4.20 TCustomWinSocket.ReceiveText Method

Reads a string from the socket connection.

Pascal

```
function ReceiveText: string;
```

C++

```
__fastcall UnicodeString ReceiveText();
```

Description

Use ReceiveText to read a string from the socket connection in the OnSocketEvent (see page 90) event handler of a Windows socket object or in the OnRead or OnClientRead event handler of a socket component. ReceiveText returns the string that was read.

ReceiveText only works in response to a read notification to a non-blocking windows socket. Blocking sockets must use a TWinSocketStream (see page 138) for reading. The TWinSocketStream (see page 138) object waits for the remote socket to be ready before transferring information.

See Also

ASyncStyles (see page 83)

OnSocketEvent (see page 90)

ReceiveBuf (see page 77)

OnRead (see page 63)

OnClientRead (see page 53)

TWinSocketStream (see page 138)

2.1.7.4.21 TCustomWinSocket.SendBuf Method

Writes Count bytes to the socket connection from the Buf parameter.

Pascal

```
function SendBuf(var Buf; Count: Integer): Integer;
```

C++

```
__fastcall int SendBuf( Buf, int Count);
```

Description

Use SendBuf to write to the socket connection. Call this method from the OnSocketEvent (see page 90) event handler of a Windows socket object or in the OnWrite or OnClientWrite event handler of a socket component. Alternately, Use SendBuf to write when a connection is first formed when the socket does not expect notification that the socket on the other end of the connection is expecting to read.

For non-blocking sockets, the data is sent to the WinSock DLL which has it's own internal buffers. If the WinSock can accept additional data, SendBuf returns immediately with the number of bytes queued. If the WinSock internal buffer space is not able to accept the buffer being sent, SendBuf returns -1 and no data is queued at all. In this case, wait a bit for the WinSock to have a chance to send out already-queued data; then try again.

For blocking sockets, SendBuf returns the number of bytes actually written.

If an error occurs while writing to the connection, SendBuf terminates the connection and raises an ESocketError (see page 13) exception.

See Also

ESocketError (see page 13)

OnSocketEvent (see page 90)

SendStream (see page 79)

SendText (see page 80)

OnWrite (see page 63)

OnClientWrite (see page 53)

TWinSocketStream (see page 138)

2.1.7.4.22 TCustomWinSocket.SendStream Method

Writes all the information that can be read from the AStream parameter to the socket connection.

Pascal

```
function SendStream(AStream: TStream): Boolean;
```

C++

```
__fastcall Boolean SendStream(TStream AStream);
```

Description

Use SendStream to write to the socket connection. The writing may occur in the OnSocketEvent (see page 90) event handler of a Windows socket object or in the OnWrite or OnClientWrite event handler of a socket component. Alternately, SendStream may write from a socket that is expected to write to the connection without a notification to signal the connection's readiness to read. SendStream reads information from the stream indicated by AStream and writes it to the socket connection. The value returned by SendStream indicates whether any information was successfully written to the connection.

Note: The Stream passed as a parameter to SendStream becomes “owned” by the windows socket object. The Windows socket object frees the stream when it is finished with it. Do not attempt to free the stream after it has been passed as a parameter.

See Also

OnSocketEvent (see page 90)

SendBuf (see page 78)

SendText (see page 80)

OnWrite (see page 63)

OnClientWrite (see page 53)

TStream

TWinSocketStream (see page 138)

2.1.7.4.23 TCustomWinSocket.SendStreamThenDrop Method

Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.

Pascal

```
function SendStreamThenDrop(AStream: TStream): Boolean;
```

C++

```
__fastcall Boolean SendStreamThenDrop(TStream AStream);
```

Description

Use SendStreamThenDrop to write to a socket connection when the connection is no longer needed after the writing is complete. SendStream (see page 79) reads information from the stream indicated by AStream and writes it to the socket connection, shutting down the connection when it is done. The value returned by SendStream (see page 79) indicates whether any information was successfully written to the connection.

Note: The Stream passed as a parameter to SendStream (see page 79) becomes "owned" by the windows socket object. The Windows socket object frees the stream when it is finished with it. Do not attempt to free the stream after it has been passed as a parameter.

See Also

Disconnect (see page 70)

SendBuf (see page 78)

SendStream (see page 79)

SendText (see page 80)

TStream

TWinSocketStream (see page 138)

2.1.7.4.24 TCustomWinSocket.SendText Method

Writes the string S to the socket connection.

Pascal

```
function SendText(const S: AnsiString): Integer;
```

C++

```
__fastcall int SendText(const AnsiString S);
```

Description

Use SendText to write a string to the socket connection. The writing may occur in the OnSocketEvent (see page 90) event handler of a Windows socket object or in the OnWrite or OnClientWrite event handler of a socket component. Alternately, SendText may write from a socket that is expected to write to the connection without a notification to signal the connection's readiness to read. If an error occurs while writing to the connection, SendText terminates the connection and raises an ESocketError (see page 13) exception.

SendText returns the number of bytes sent. Note that this may be less than the length of the string S if the socket is nonblocking.

See Also

ESocketError (see page 13)

OnSocketEvent (see page 90)

SendBuf (see page 78)

SendStream (see page 79)

OnWrite (see page 63)

OnClientWrite (see page 53)

TWinSocketStream (see page 138)

2.1.7.4.25 TCustomWinSocket.SetAsyncStyles Method

Sets the ASyncStyles (see page 83) property.

Pascal

```
procedure SetAsyncStyles(Value: TASyncStyles);
```

C++

```
__fastcall SetAsyncStyles(TASyncStyles Value);
```

Description

SetAsyncStyles implements the ASyncStyles (see page 83) property. Override SetAsyncStyles to limit the value of ASyncStyles (see page 83) to notifications that are appropriate to a particular type of Windows socket.

See Also

ASyncStyles (see page 83)

2.1.7.4.26 TCustomWinSocket.Unlock Method

Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.

Pascal

```
procedure Unlock;
```

C++

```
__fastcall Unlock();
```

Description

Call Unlock at the end of a section of code that is not thread-safe. Every call to Unlock should match a call to the Lock (see page 74) method at the beginning of the critical section of code.

See Also

Lock (see page 74)

TThread

2.1.7.4.27 TCustomWinSocket.Write Method

Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

Pascal

```
procedure Write(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Write(TSocket Socket);
```

Description

Write is called in response to asynchronous notifications that the socket connection is ready for the socket to send information. The Windows socket can write to the connection in the OnSocketEvent (see page 90) event handler or the socket component can write to the connection in an OnWrite or OnClientWrite event handler. The event handler can use the SendBuf (see page

78) method, the SendStream (see page 79) method, or the SendText (see page 80) method to write the information to the connection.

Note: Write is only called for asynchronous write notifications in a non-blocking socket. Blocking sockets must use their own mechanisms for determining when the connection is ready for the socket to write.

See Also

ASyncStyles (see page 83)

OnSocketEvent (see page 90)

SendBuf (see page 78)

SendStream (see page 79)

SendText (see page 80)

OnWrite (see page 63)

OnClientWrite (see page 53)

TWinSocketStream (see page 138)

2.1.7.5 TCustomWinSocket Properties

The properties of the TCustomWinSocket class are listed here.

Public Properties

	Name	Description
	Addr (see page 82)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 83)	Determines which asynchronous events the socket can receive.
	Connected (see page 83)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 84)	Points to application-specific data associated with the socket.
	Handle (see page 84)	Specifies the handle of the window that receives notifications from the Windows socket.
	LocalAddress (see page 85)	Specifies the IP address of the local system that was bound to the socket connection.
	LocalHost (see page 85)	Specifies the name of the local system.
	LocalPort (see page 86)	Specifies the ID number of the port used by the socket connection.
	LookupState (see page 86)	Indicates any asynchronous activities occurring while opening a connection.
	RemoteAddr (see page 87)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
	RemoteAddress (see page 87)	Specifies the IP address of the remote system that was bound to the socket connection.
	RemoteHost (see page 88)	Specifies the name of the remote system.
	RemotePort (see page 88)	Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.
	SocketHandle (see page 89)	Specifies the Windows handle for the socket.

2.1.7.5.1 TCustomWinSocket.Addr Property

Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.

Pascal

```
property Addr: TSockAddrIn;
```

C++

```
__property TSockAddrIn Addr;
```

Description

Use Addr to represent the port used by the socket when working directly with Windows socket API calls. For client sockets, the value of Addr represents the target remote port. For server sockets, Addr is determined by the values of the LocalAddress (see page 85) and LocalPort (see page 86) properties.

See Also

LocalAddress (see page 85)

LocalPort (see page 86)

RemoteAddr (see page 87)

2.1.7.5.2 TCustomWinSocket.ASyncStyles Property

Determines which asynchronous events the socket can receive.

Pascal

```
property ASyncStyles: TAsyncStyles;
```

C++

```
__property TAsyncStyles ASyncStyles;
```

Description

Use ASyncStyles to determine what sorts of notifications the socket needs to respond to. Set ASyncStyles to change the notifications that the socket receives from the socket connection. ASyncStyles is a set drawn from the following values:

Value	Meaning
asRead	The socket receives notification that the connection is ready for reading.
asWrite	The socket receives notification that the connection is ready for writing.
asOOB	The socket receives notification when out-of-band data arrives.
asAccept	The socket receives notification when another socket requests a connection.
asConnect	The socket receives notification when a communication link to another socket is opened.
asClose	The socket receives notification when a communication link to another socket is terminated.

Any notification specified by ASyncStyles arrives as a window message to the Handle (see page 84) property.

Note: If the socket is a non-blocking socket, then ASyncStyles should include asRead and asWrite so that the socket will be informed of asynchronous reading and writing events.

See Also

Handle (see page 84)

ClientType (see page 38)

ServerType (see page 131)

2.1.7.5.3 TCustomWinSocket.Connected Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Read (see page 76) Connected before trying to use or change the Windows socket connection. Connected indicates whether the socket connection has been established. When Connected is true, the Windows socket is open and available for use. When Connected is false, the Windows socket is closed and can be changed.

To open a client Windows socket, use the Open (see page 75) method. To open a server Windows socket, use the Listen (see page 73) method. The Windows socket that represents the server endpoint of a connection to a client socket is opened in its constructor.

To close a Windows socket, use the Close (see page 69) method.

See Also

Open (see page 75)

Close (see page 69)

Listen (see page 73)

Active (see page 21)

2.1.7.5.4 TCustomWinSocket.Data Property

Points to application-specific data associated with the socket.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate information specific to the socket connection with the Windows socket object. For example, Data can be used to store access and authentication information used by a server socket to evaluate client connection requests.

Data can store information in a thread-safe manner that would otherwise require the use of global variables. This is useful given the multi-threaded nature of many client-server applications.

2.1.7.5.5 TCustomWinSocket.Handle Property

Specifies the handle of the window that receives notifications from the Windows socket.

Pascal

```
property Handle: HWnd;
```

C++

```
__property HWnd Handle;
```

Description

Use Handle to send messages to the Windows socket or to subclass the Window procedure that receives messages of asynchronous events from the socket connection.

See Also

ASyncStyles (see page 83)

2.1.7.5.6 TCustomWinSocket.LocalAddress Property

Specifies the IP address of the local system that was bound to the socket connection.

Pascal

```
property LocalAddress: string;
```

C++

```
__property UnicodeString LocalAddress;
```

Description

LocalAddress is a string of four numeric (byte) values in the standard Internet dot notation, such as

`123.197.1.2`

Each address identifies the system and indicates the types of interfaces supported by the socket. A single system (machine) can support multiple addresses. LocalAddress is the address from among the possible addresses supported by the local system that is bound to the socket connection.

A single LocalAddress can be used simultaneously by multiple socket connections. Each of those connections must have a unique LocalPort (see page 86) number to distinguish it from other connections to the same LocalAddress.

See Also

LocalHost (see page 85)

LocalPort (see page 86)

RemoteAddress (see page 87)

Address (see page 22)

2.1.7.5.7 TCustomWinSocket.LocalHost Property

Specifies the name of the local system.

Pascal

```
property LocalHost: string;
```

C++

```
__property UnicodeString LocalHost;
```

Description

Use LocalHost to get the name of the system that is running the application that uses the Windows socket. LocalHost is a string containing the domain name and service of the local socket endpoint, such as

`http://www.wSite.Com`

LocalHost provides an alias for the local IP address given in the LocalAddress (see page 85) property. Most Intranets provide host names for the IP addresses of systems on the net. On Windows 95 and NT machines, if a host name is not available, create one for the local IP address by entering the name into the HOSTS file. See the Microsoft documentation on Windows sockets for more information on the HOSTS file.

See Also

LocalAddress (see page 85)

RemoteHost (see page 88)

Host (see page 22)

2.1.7.5.8 TCustomWinSocket.LocalPort Property

Specifies the ID number of the port used by the socket connection.

Pascal

```
property LocalPort: Integer;
```

C++

```
__property int LocalPort;
```

Description

Use LocalPort to determine the port number that is bound to the socket connection. For server endpoints of listening connections, LocalPort is the ID associated with the service the server socket provides. For client or server endpoints of connections to another socket, LocalPort is usually an arbitrary value picked when the connection was made.

Port numbers allow a single system, identified by the LocalAddress (see page 85) property, to host multiple connections simultaneously. Each combination of LocalPort and LocalAddress (see page 85) can only be bound to a single socket connection. This combination is represented by the Addr (see page 82) property.

Many values of LocalPort are associated by convention with a particular service such as ftp or http. To determine whether the value of LocalPort is associated with a specific service, use the LookupService (see page 75) method.

See Also

Addr (see page 82)

LocalAddress (see page 85)

LookupService (see page 75)

RemotePort (see page 88)

2.1.7.5.9 TCustomWinSocket.LookupState Property

Indicates any asynchronous activities occurring while opening a connection.

Pascal

```
property LookupState: TLookupState;
```

C++

```
__property TLookupState LookupState;
```

Description

LookupState is used internally to coordinate asynchronous activities while opening a connection. The AsyncInitSocket (see page 68) method sets the value of LookupState to indicate when it is looking up various types of information. The following table lists the possible values:

Value	Meaning
lsIdle	The socket is not currently looking up any information asynchronously.
lsLookupAddress	The socket is looking up an IP address asynchronously and has not yet received the result.
lsLookupService	The socket is looking up a Service asynchronously and has not yet received the result.

See Also

AsyncInitSocket (see page 68)

Open (see page 75)

Listen (see page 73)

2.1.7.5.10 TCustomWinSocket.RemoteAddr Property

Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.

Pascal

```
property RemoteAddr: TSockAddrIn;
```

C++

```
__property TSockAddrIn RemoteAddr;
```

Description

When working directly with Windows socket API calls, use RemoteAddr to represent the port used by the socket on the other end of the connection. The value of RemoteAddr is determined by the values of the RemoteAddress (see page 87) and RemotePort (see page 88) properties.

See Also

Addr (see page 82)

RemoteAddress (see page 87)

RemotePort (see page 88)

2.1.7.5.11 TCustomWinSocket.RemoteAddress Property

Specifies the IP address of the remote system that was bound to the socket connection.

Pascal

```
property RemoteAddress: string;
```

C++

```
__property UnicodeString RemoteAddress;
```

Description

RemoteAddress is a string of four numeric (byte) values in the standard Internet dot notation, such as

```
123.197.1.2
```

Each address identifies the system on the other end of the socket connection and indicates the types of interfaces supported by the remote socket. A single system can support multiple addresses. RemoteAddress is the address from among the possible addresses supported by the remote system that is bound to the socket connection.

A single RemoteAddress may be participating in multiple socket connections. Each of those connections has a unique RemotePort (see page 88) number to distinguish it from other connections to the same RemoteAddress. The RemoteAddr (see page 87) property uniquely identifies the RemoteAddress and RemotePort (see page 88) combination used by the socket connection.

See Also

LocalAddress (see page 85)

RemoteAddr (see page 87)

RemoteHost (see page 88)

RemotePort (see page 88)

Address (see page 22)

2.1.7.5.12 TCustomWinSocket.RemoteHost Property

Specifies the name of the remote system.

Pascal

```
property RemoteHost: string;
```

C++

```
__property UnicodeString RemoteHost;
```

Description

Use RemoteHost to get the name of the system on the other end of the socket connection. RemoteHost is a string containing the domain name and service of the remote endpoint of the socket connection, such as

`http://www.wSite.Com`

LocalHost (see page 85) provides an alias for the local IP address given in the RemoteAddress (see page 87) property.

See Also

LocalHost (see page 85)

RemoteAddress (see page 87)

Address (see page 22)

Host (see page 22)

2.1.7.5.13 TCustomWinSocket.RemotePort Property

Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.

Pascal

```
property RemotePort: Integer;
```

C++

```
__property int RemotePort;
```

Description

Use RemotePort to determine the port number used by the socket on the other end of the socket connection.

Port numbers allow a single system, identified by the RemoteAddress (see page 87) or RemoteHost (see page 88) property, to host multiple connections simultaneously. Each combination of RemotePort and RemoteAddress (see page 87) can only be bound to a single socket connection. This combination is represented by the RemoteAddr (see page 87) property.

Many port numbers are associated by convention with a particular service such as ftp or http. To determine whether the value of RemotePort is associated with a specific service, use the LookupService (see page 75) method.

Note: If a client socket requests a specific port to indicate a desired service, the value of RemotePort for the actual connection may differ from the requested port number. Most server sockets listen on the port associated with a service, but switch to an arbitrary available port number for forming connections.

See Also

LookupState (see page 86)

RemoteAddr (see page 87)

RemoteAddress (see page 87)

RemoteHost (see page 88)

Port (see page 23)

2.1.7.5.14 TCustomWinSocket.SocketHandle Property

Specifies the Windows handle for the socket.

Pascal

```
property SocketHandle: TSocket;
```

C++

```
__property TSocket SocketHandle;
```

Description

Use SocketHandle for Windows socket API calls that require the handle to the socket. When the Connected (see page 83) property is false, SocketHandle is INVALID_SOCKET.

SocketHandle is set to a valid Windows socket handle by the Listen (see page 73) or Open (see page 75) method.

See Also

Connected (see page 83)

Create (see page 66)

Listen (see page 73)

Open (see page 75)

2.1.7.6 TCustomWinSocket Events

The events of the TCustomWinSocket class are listed here.

Public Events

	Name	Description
	OnErrorEvent (see page 89)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 90)	Occurs when the Windows socket receives notification of asynchronous events.

2.1.7.6.1 TCustomWinSocket.OnErrorEvent Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnErrorEvent: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnErrorEvent;
```

Description

Socket components provide an OnErrorEvent event handler that converts error notifications into error events on the socket component. Most applications will therefore not provide an event handler for OnErrorEvent.

See Also

ESocketError (see page 13)

InitSocket (see page 18)

ASyncStyles (see page 83)

2.1.7.6.2 TCustomWinSocket.OnSocketEvent Event

Occurs when the Windows socket receives notification of asynchronous events.

Pascal

```
property OnSocketEvent: TSocketEventEvent;
```

C++

```
__property TSocketEventEvent OnSocketEvent;
```

Description

Socket components provide an OnSocketEvent event handler that converts Windows socket notifications into events on the socket component. Most applications will therefore not provide an event handler for OnSocketEvent. Replacing this event handler can prevent some expected events from occurring.

The Sender parameter is the Windows socket object that owns the event handler. Usually, this is the same as the Socket parameter.

The Socket parameter indicates the Windows socket that generates or receives notification of the event.

The SocketEvent parameter indicates the event that occurred.

See Also

ASyncStyles (see page 83)

InitSocket (see page 18)

2.1.8 TServerAcceptThread Class

Class Hierarchy

Pascal

```
TServerAcceptThread = class(TThread);
```

C++

```
class TServerAcceptThread : public TThread;
```

File

ScktComp

Description

This is class ScktComp.TServerAcceptThread.

2.1.8.1 TServerAcceptThread Members

The following tables list the members exposed by TServerAcceptThread.

Public Methods

	Name	Description
	Create (see page 91)	This is Create, a member of class TServerAcceptThread.
V	Execute (see page 91)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Public Properties

	Name	Description
R	ServerSocket (see page 95)	This is ServerSocket, a member of class TServerAcceptThread.

2.1.8.2 TServerAcceptThread.Create Constructor

Pascal

```
constructor Create(CreateSuspended: Boolean; ASocket: TServerWinSocket);
```

C++

```
__fastcall TServerAcceptThread(Boolean CreateSuspended, TServerWinSocket ASocket);
```

Description

This is Create, a member of class TServerAcceptThread.

2.1.8.3 TServerAcceptThread Methods

The methods of the TServerAcceptThread class are listed here.

Public Methods

	Name	Description
V	Execute (see page 91)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

2.1.8.3.1 TServerAcceptThread.Execute Method

Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Override Execute and insert the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

A thread executes when Create is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

C++ Examples:

```
/*
This example shows how to create a thread and start it
running at a lower priority than the main execution thread.
Set the thread's FreeOnTerminate property is True, so that
there is no need to free the thread when it finishes. To
create the extension choose the
File | New | Other | Thread Object menu.
*/
bool mythreadRunning;
bool youthreadRunning;

class TMyThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TMyThread(bool suspended);
};

__fastcall TMyThread::TMyThread(bool suspended)
    : TThread(suspended)
{
}

class TYouThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TYouThread(bool suspended);
};

__fastcall TYouThread::TYouThread(bool suspended)
    : TThread(suspended)
{
}

void __fastcall TMyThread::Execute()
{
  Form1->Memo1->Lines->Add("Process has been running for this many seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo1->Lines->Add("Low priority process " + IntToStr(I));
    Sleep(1000);
  }
  mythreadRunning = FALSE;
}

void __fastcall TYouThread::Execute()
{
  Form1->Memo3->Lines->Add("Second low priority process has been running for this many
```

```
seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo3->Lines->Add("Second low priority process " + IntToStr(I));
    Sleep(1000);
  }
  youthreadRunning = FALSE;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMyThread *SecondProcess; // TMyThread is a custom descendant of TThread
  if (mythreadRunning == FALSE)
  {
    mythreadRunning = TRUE;
    SecondProcess = new TMyThread(True); // create suspended – secondprocess does not run yet
    SecondProcess->FreeOnTerminate = True; // don't need to cleanup after terminate
    SecondProcess->Priority = tpLower;  // set the priority to lower than normal
    SecondProcess->Resume(); // now run the thread
  }
  else
    MessageDlg("This thread is still running.  You are going to hurt yourself!",
      mtInformation, TMsgDlgButtons() << mbOK, 0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form1->Memo2->Lines->Add("Do some work in the main process for 10 seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo2->Lines->Add("Main process " + IntToStr(I));
    Sleep(1000);
  }
}

void __fastcall TForm1::Button3Click(TObject *Sender)

2.1.8.4 TServerAcceptThread Properties

The properties of the TServerAcceptThread class are listed here.

Public Properties

	Name	Description
	ServerSocket (see page 95)	This is ServerSocket, a member of class TServerAcceptThread.

2.1.8.4.1 TServerAcceptThread.ServerSocket Property

Pascal

```
property ServerSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerSocket;
```

Description

This is ServerSocket, a member of class TServerAcceptThread.

2.1.9 TServerClientThread Class

TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.

Class Hierarchy

Pascal

```
TServerClientThread = class(TThread);
```

C++

```
class TServerClientThread : public TThread;
```

File

ScktComp

Description

TServerWinSocket (see page 120) objects spawn TServerClientThread objects to handle separate client connections in separate execution threads. This allows server sockets to perform slow reading and writing operations with client sockets without adversely affecting the performance on other connections.

TServerClientThread introduces new properties to

Access the TServerWinSocket (see page 120) object that spawned the thread and the TServerClientWinSocket (see page 104) that is connected to the client socket.

Store and access thread-specific data.

Determine if the thread is stored in a thread cache maintained by the TServerWinSocket (see page 120).

Applications that receive frequent client requests will want to derive a descendant class from TServerClientThread to handle reading and writing to separate clients. This is because TServerClientThread objects use the OnClientRead and OnClientWrite events of the associated server socket. These events are not thread-local.

See Also

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.9.1 TServerClientThread Members

The following tables list the members exposed by TServerClientThread.

Protected Methods

	Name	Description
	ClientExecute (see page 98)	Simulates OnClientRead and OnClientWrite events for the associated server socket.
	DoTerminate (see page 99)	Removes the thread from the list of active threads maintained by the associated server socket.
	EndConnect (see page 99)	Indicates whether the thread should execute again for another client.
	Error (see page 100)	Generates an OnClientError event for the associated server socket.
	Event (see page 100)	Generates an OnSocketEvent event for the associated server socket.
	Execute (see page 101)	Manages the caching of server client threads and calls the ClientExecute (see page 98) method to run the thread for individual client connections.
	HandleException (see page 101)	Displays an error message using the main VCL thread.
	ReActivate (see page 101)	Initializes the thread for a particular client connection.
	StartConnect (see page 102)	Indicates when the thread is ready to execute.

Public Methods

	Name	Description
	Create (see page 97)	Creates an instance of TServerClientThread (see page 95).
V	Destroy (see page 98)	Destroys the server client thread object and releases the memory allocated to it.

Public Properties

	Name	Description
R	ClientSocket (see page 102)	Specifies the TServerClientWinSocket (see page 104) object that uses the thread for all reading and writing over the socket connection.
	Data (see page 103)	Points to application-specific data associated with the thread.
	KeepInCache (see page 103)	Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 104).
R	ServerSocket (see page 104)	Specifies the TServerWinSocket (see page 120) object that manages all the TServerClientThread (see page 95) objects for its client connections.

2.1.9.2 TServerClientThread.Create Constructor

Creates an instance of TServerClientThread (see page 95).

Pascal

```
constructor Create(CreateSuspended: Boolean; ASocket: TServerClientWinSocket);
```

C++

```
__fastcall TServerClientThread(Boolean CreateSuspended, TServerClientWinSocket ASocket);
```

Description

Use Create to create an instance of TServerClientThread (see page 95) for a connection to a client socket, and add the thread to the cache maintained by the associated listening socket.

Initializes FreeOnTerminate to true.

Initializes Priority to tpHigher.

Initializes ClientSocket (see page 102) to the ASocket parameter and ServerSocket (see page 104) to ASocket.ServerWinSocket.

Starts the thread executing.

Adds the thread to the cache maintained by ServerSocket (see page 104).

Sets the OnErrorEvent and OnSocketEvent event handlers of ClientSocket (see page 102) so that events are sent to ServerSocket (see page 104).

Signals when initialization is complete and the thread is ready for reading from or writing to the client connection.

See Also

ClientSocket (see page 102)

FreeOnTerminate

Priority

ServerSocket (see page 104)

OnErrorEvent (see page 89)

OnSocketEvent (see page 90)

2.1.9.3 TServerClientThread.Destroy Destructor

Destroys the server client thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerClientThread();
```

Description

Do not call Destroy directly in an application. ServerClientThread objects are freed by the TServerWinSocket (see page 120) object that manages them.

Destroy frees the TServerClientWinSocket (see page 104) object that encapsulates the connection to the client socket before calling the inherited destructor.

See Also

ClientSocket (see page 102)

ServerSocket (see page 104)

2.1.9.4 TServerClientThread Methods

The methods of the TServerClientThread class are listed here.

Protected Methods

	Name	Description
	ClientExecute (see page 98)	Simulates OnClientRead and OnClientWrite events for the associated server socket.
	DoTerminate (see page 99)	Removes the thread from the list of active threads maintained by the associated server socket.
	EndConnect (see page 99)	Indicates whether the thread should execute again for another client.
	Error (see page 100)	Generates an OnClientError event for the associated server socket.
	Event (see page 100)	Generates an OnSocketEvent event for the associated server socket.
	Execute (see page 101)	Manages the caching of server client threads and calls the ClientExecute (see page 98) method to run the thread for individual client connections.
	HandleException (see page 101)	Displays an error message using the main VCL thread.
	ReActivate (see page 101)	Initializes the thread for a particular client connection.
	StartConnect (see page 102)	Indicates when the thread is ready to execute.

2.1.9.4.1 TServerClientThread.ClientExecute Method

Simulates OnClientRead and OnClientWrite events for the associated server socket.

Pascal

```
procedure ClientExecute; virtual;
```

C++

```
virtual __fastcall ClientExecute();
```

Description

TServerClientThread (see page 95) calls ClientExecute from its Execute (see page 101) method. ClientExecute checks

whether there is any information to read from the associated socket connection, and if so, simulates an OnClientRead event on the associated server socket. If there is no information sent from the client, ClientExecute simulates an OnClientWrite event.

Because the server socket that receives these events is not local to the thread, the events occur within the main VCL thread using the Synchronize method. This method can be too slow if the server socket has many client connections, because each thread must wait for any other thread to finish reading or writing. When a server socket receives many client connection requests, override ClientExecute to handle the reading or writing using a thread-local instance of TWinSocketStream (see page 138). In the ClientExecute method, be sure to check the Terminated property periodically.

Note: Do not use the properties and methods of global objects directly in the ClientExecute method. Instead, separate the use of objects that are not thread-local into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

See Also

Execute (see page 101)

Synchronize

TWinSocketStream (see page 138)

Terminated

DoTerminate (see page 99)

2.1.9.4.2 TServerClientThread.DoTerminate Method

Removes the thread from the list of active threads maintained by the associated server socket.

Pascal

```
procedure DoTerminate; override;
```

C++

```
virtual __fastcall DoTerminate();
```

Description

DoTerminate overrides the inherited method to suppress the OnTerminate event. Instead, it removes the thread from the Connections property of the associated TServerWinSocket (see page 120). The thread is then either added to the server socket's thread cache or destroyed.

See Also

ClientExecute (see page 98)

Terminated

Connections (see page 130)

2.1.9.4.3 TServerClientThread.EndConnect Method

Indicates whether the thread should execute again for another client.

Pascal

```
function EndConnect: Boolean;
```

C++

```
__fastcall Boolean EndConnect();
```

Description

The Execute (see page 101) method calls EndConnect when the ClientExecute (see page 98) method finishes. It frees all memory associated with the current client connection and checks whether the Thread is being reused for another client connection. If the thread should be reused, EndConnect returns true to indicate that the ClientExecute (see page 98) method should be called again.

See Also

ClientExecute (see page 98)

Execute (see page 101)

2.1.9.4.4 TServerClientThread.Error Method

Generates an OnClientError event for the associated server socket.

Pascal

```
procedure Error(ErrorEvent: TErrorEvent; var ErrorCode: Integer); virtual;
```

C++

```
virtual __fastcall Error(TErrorEvent ErrorEvent, int ErrorCode);
```

Description

TServerClientThread (see page 95) assigns the Error method as an event handler for the OnErrorEvent method of the associated TClientWinSocket (see page 35) object. This allows errors received from the client to generate OnClientError events on the server socket.

Warning: Error is not thread-safe. It should not be called from the server client thread. It is only intended for use by the associated client socket, which is not local to the server client thread.

See Also

OnClientError (see page 52)

OnErrorEvent (see page 89)

2.1.9.4.5 TServerClientThread.Event Method

Generates an OnSocketEvent event for the associated server socket.

Pascal

```
procedure Event(SocketEvent: TSocketEvent); virtual;
```

C++

```
virtual __fastcall Event(TSocketEvent SocketEvent);
```

Description

TServerClientThread (see page 95) assigns the Event method as an event handler for the OnSocketEvent method of the associated TClientWinSocket (see page 35) object. This allows events generated by the client to trigger client events on the server socket.

Warning: Event is not thread-safe. It should not be called from the server client thread. It is only intended for use by the associated client socket, which is not local to the server client thread.

See Also

OnClientError (see page 52)

OnErrorEvent (see page 89)

2.1.9.4.6 TServerClientThread.Execute Method

Manages the caching of server client threads and calls the ClientExecute (see page 98) method to run the thread for individual client connections.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Execute is called automatically when the thread runs. A thread runs when Create (see page 97) is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Do not override the Execute method to implement the thread function of a TServerClientThread (see page 95) descendant. Instead, override the ClientExecute (see page 98) method, which is run after the thread is initialized for a particular client connection.

See Also

ClientExecute (see page 98)

ReActivate (see page 101)

2.1.9.4.7 TServerClientThread.HandleException Method

Displays an error message using the main VCL thread.

Pascal

```
procedure HandleException; virtual;
```

C++

```
virtual __fastcall HandleException();
```

Description

HandleException obtains the current exception object and calls TApplication.ShowException (see page 4240) (for descendants of Exception (see page 3949)) or the global ShowException (see page 4240) procedure (for other objects) to display an error message. HandleException wraps the call to ShowException (see page 4240) in the Synchronize method to ensure that the call is thread-safe.

See Also

ShowException

ShowException (see page 4240)

Synchronize

2.1.9.4.8 TServerClientThread.ReActivate Method

Initializes the thread for a particular client connection.

Pascal

```
procedure ReActivate(ASocket: TServerClientWinSocket);
```

C++

```
__fastcall ReActivate(TServerClientWinSocket ASocket);
```

Description

ReActivate is called when the thread is created or reactivated from the server socket's cache of threads. ReActivate assigns the Error (see page 100) and Event (see page 100) methods as event handlers for the associated TServerWinSocket (see page 120) and informs the server socket that the thread is now active.

See Also

Error (see page 100)

TServerClientThread (see page 95)

2.1.9.4.9 TServerClientThread.StartConnect Method

Indicates when the thread is ready to execute.

Pascal

```
function StartConnect: Boolean;
```

C++

```
__fastcall Boolean StartConnect();
```

Description

The Execute (see page 101) method calls StartConnect to determine when to call ClientExecute (see page 98). StartConnect waits until the ReActivate (see page 101) method has signaled that the thread is properly initialized, and then returns true if the thread is ready to run. If the thread is terminated for any reason before it is fully initialized, StartConnect returns false.

See Also

ReActivate (see page 101)

ClientExecute (see page 98)

Execute (see page 101)

2.1.9.5 TServerClientThread Properties

The properties of the TServerClientThread class are listed here.

Public Properties

	Name	Description
R	ClientSocket (see page 102)	Specifies the TServerClientWinSocket (see page 104) object that uses the thread for all reading and writing over the socket connection.
	Data (see page 103)	Points to application-specific data associated with the thread.
	KeepInCache (see page 103)	Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 104).
R	ServerSocket (see page 104)	Specifies the TServerWinSocket (see page 120) object that manages all the TServerClientThread (see page 95) objects for its client connections.

2.1.9.5.1 TServerClientThread.ClientSocket Property

Specifies the TServerClientWinSocket (see page 104) object that uses the thread for all reading and writing over the socket connection.

Pascal

```
property ClientSocket: TServerClientWinSocket;
```

C++

```
__property TServerClientWinSocket ClientSocket;
```

Description

Use ClientSocket to gain direct access to the Windows socket component that uses the thread. If ClientSocket is nil (Delphi) or NULL (C++), the thread is idle and available for reuse by another TServerClientWinSocket (see page 104) object. TServerClientThread (see page 95) uses ClientSocket to read from or write to the socket connection.

See Also

TServerClientWinSocket (see page 104)

2.1.9.5.2 TServerClientThread.Data Property

Points to application-specific data associated with the thread.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate information with the thread object. Data can store information in a thread-safe manner that would otherwise require the use of global variables.

See Also

Data (see page 84)

2.1.9.5.3 TServerClientThread.KeepInCache Property

Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 104).

Pascal

```
property KeepInCache: Boolean;
```

C++

```
__property Boolean KeepInCache;
```

Description

The TServerWinSocket (see page 120) that spawns server client threads for its connections to client sockets maintains a cache of server client threads for reuse. As server client threads are activated, the TServerWinSocket (see page 120) object sets the KeepInCache property to indicate whether the thread will fit in the thread cache.

When KeepInCache is true, FreeOnTerminate is set to false before the thread terminates, and the thread is left in the thread cache. When KeepInCache is false, the thread is freed when execution terminates.

See Also

FreeOnTerminate

ServerSocket (see page 104)

ThreadCacheSize (see page 132)

2.1.9.5.4 TServerClientThread.ServerSocket Property

Specifies the TServerWinSocket (see page 120) object that manages all the TServerClientThread (see page 95) objects for its client connections.

Pascal

```
property ServerSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerSocket;
```

Description

Use ServerSocket to get direct access to the listening Windows socket object that spawned the thread for a client connection it accepted. TServerClientThread (see page 95) passes events and errors to the appropriate event handlers assigned to ServerSocket. TServerClientThread (see page 95) adds itself to the cache of threads maintained by ServerSocket from its constructor, and removes itself when the thread terminates.

See Also

Create (see page 97)

TServerWinSocket (see page 120)

2.1.10 TServerClientWinSocket Class

TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.

Class Hierarchy

Pascal

```
TServerClientWinSocket = class(TCustomWinSocket);
```

C++

```
class TServerClientWinSocket : public TCustomWinSocket;
```

File

SckComp

Description

TServerClientWinSocket is used by server socket components to manage the Windows socket API calls for the socket connection to an individual client socket. TServerClientWinSocket objects are created when a client socket connection is accepted by a listening server socket.

Applications can create and customize the properties of a TServerClientWinSocket object in an OnGetSocket event handler for a server socket component. Component writers can create descendants of TServerClientWinSocket that may be substituted for TServerClientWinSocket in the OnGetSocket event handler.

See Also

TClientWinSocket (see page 35)

TCustomServerSocket (see page 39)

TServerSocket (see page 108)

TServerWinSocket (see page 120)

2.1.10.1 TServerClientWinSocket Members

The following tables list the members exposed by TServerClientWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 68)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 70)	Opens a listening connection.
	DoOpen (see page 71)	Opens a connection to a remote socket.
	Error (see page 71)	Generates an OnErrorEvent (see page 89) event.
	Event (see page 72)	Triggers an OnSocketEvent (see page 90) event.
	InitSocket (see page 72)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 81)	Sets the ASyncStyles (see page 83) property.

Public Events

	Name	Description
	OnErrorEvent (see page 89)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 90)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
	Accept (see page 68)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 69)	Shuts down the socket connection if it is open.
	Connect (see page 69)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 106)	Creates and initializes an instance of TServerClientWinSocket (see page 104).
	DefaultHandler (see page 70)	Processes message records.
	Destroy (see page 107)	Destroys an instance of TServerClientWinSocket (see page 104).
	Disconnect (see page 70)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 73)	Opens a listening connection for a server socket.
	Lock (see page 74)	Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.
	LookupName (see page 74)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 75)	Returns the port number associated with a specific service.
	Open (see page 75)	Opens a connection to a remote socket.
	Read (see page 76)	Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 77)	Reads up to Count bytes from the socket connection into the Buf parameter.
	ReceiveLength (see page 77)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 78)	Reads a string from the socket connection.
	SendBuf (see page 78)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection.
	SendStreamThenDrop (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 80)	Writes the string S to the socket connection.
	Unlock (see page 81)	Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.
	Write (see page 81)	Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
	Addr (see page 82)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 83)	Determines which asynchronous events the socket can receive.
	Connected (see page 83)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 84)	Points to application-specific data associated with the socket.
	Handle (see page 84)	Specifies the handle of the window that receives notifications from the Windows socket.
	LocalAddress (see page 85)	Specifies the IP address of the local system that was bound to the socket connection.
	LocalHost (see page 85)	Specifies the name of the local system.
	LocalPort (see page 86)	Specifies the ID number of the port used by the socket connection.
	LookupState (see page 86)	Indicates any asynchronous activities occurring while opening a connection.
	RemoteAddr (see page 87)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
	RemoteAddress (see page 87)	Specifies the IP address of the remote system that was bound to the socket connection.
	RemoteHost (see page 88)	Specifies the name of the remote system.
	RemotePort (see page 88)	Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.
	ServerWinSocket (see page 107)	Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 104).
	SocketHandle (see page 89)	Specifies the Windows handle for the socket.

2.1.10.2 TServerClientWinSocket.Create Constructor

Creates and initializes an instance of TServerClientWinSocket (see page 104).

Pascal

```
constructor Create(Socket: TSocket; ServerWinSocket: TServerWinSocket);
```

C++

```
__fastcall TServerClientWinSocket(TSocket Socket, TServerWinSocket ServerWinSocket);
```

Description

Use Create to create an instance of TServerClientWinSocket (see page 104) in the OnGetSocket event handler of a server socket component. The Socket parameter is the Windows socket handle for the accepted socket connection to a client socket. The ServerWinSocket (see page 107) parameter is the Windows socket object for the listening connection that accepted the connection to the client socket.

Create adds the new TServerClientWinSocket (see page 104) object to the list of connections maintained by the listening server socket. It then sets the OnSocketEvent (see page 90) event handler so that notifications from the connection to the client can be passed on to the server socket. After setting up the connection to the server socket, Create calls the inherited constructor.

See Also

OnSocketEvent (see page 90)

Create (see page 66)

Connections (see page 130)

2.1.10.3 TServerClientWinSocket.Destroy Destructor

Destroys an instance of TServerClientWinSocket (see page 104).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerClientWinSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TServerClientWinSocket (see page 104) reference is not nil, and only then calls Destroy. Instances of TServerClientWinSocket (see page 104) are freed automatically when the connection is closed.

Destroy removes the TServerClientWinSocket (see page 104) from the list of connections maintained by the listening windows socket.

See Also

System::TObject::Free (see page 3372)

Connections (see page 130)

2.1.10.4 TServerClientWinSocket Properties

The properties of the TServerClientWinSocket class are listed here.

Public Properties

	Name	Description
	ServerWinSocket (see page 107)	Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 104).

2.1.10.4.1 TServerClientWinSocket.ServerWinSocket Property

Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 104).

Pascal

```
property ServerWinSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerWinSocket;
```

Description

Use ServerWinSocket to gain access to the Windows socket object for the listening connection that spawned this TServerClientWinSocket (see page 104). Use the ServerWinSocket to trigger events that can be handled by the event handlers of the server socket, to get execution threads from the cache maintained by the Windows server socket, or to get information about the other active connections accepted by the server socket.

See Also

TServerWinSocket (see page 120)

2.1.11 TServerSocket Class

TServerSocket manages server socket connections for a TCP/IP server.

Class Hierarchy

Pascal

```
TServerSocket = class(TCustomServerSocket);
```

C++

```
class TServerSocket : public TCustomServerSocket;
```

File

SckComp

Description

Add a TServerSocket object to a form or data module to turn an application into a TCP/IP server. TServerSocket listens for requests for TCP/IP connections from other machines, and establishes connections when requests are received.

See Also

TClientSocket (see page 24)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.11.1 TServerSocket Members

The following tables list the members exposed by TServerSocket.

Protected Events

	Name	Description
	OnConnect (see page 60)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 60)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 61)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 61)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 62)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 63)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 63)	Occurs when a client socket should write information to the socket connection.

Protected Fields

	Name	Description
	FServerSocket (see page 42)	This is FServerSocket, a member of class TCustomServerSocket.

Protected Methods

	Name	Description
A	DoActivate (see page 16)	Provides the prototype of a method to open or close the socket connection.
V	DoActivate (see page 42)	Opens or Closes the socket connection.
A	Error (see page 16)	Provides the prototype of a method that responds to error conditions.

	Error (see page 58)	Generates an OnError (see page 61) event.
	Event (see page 17)	Provides the prototype of a method that responds when specific socket events occur.
	Event (see page 58)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetGetSocketEvent (see page 43)	Returns the OnGetSocket (see page 54) event handler.
	GetGetThreadEvent (see page 43)	Returns the OnGetThread (see page 54) event handler.
	GetOnClientError (see page 44)	Returns the OnClientError (see page 52) event handler.
	GetOnClientEvent (see page 44)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 44)	Returns the OnThreadEnd (see page 55) event handler.
	GetOnThreadStart (see page 45)	Returns the OnThreadStart (see page 55) event handler.
	GetServerType (see page 45)	Returns the ServerType (see page 49) property.
	GetThreadCacheSize (see page 45)	Returns the value of the ThreadCacheSize (see page 50) property.
	InitSocket (see page 18)	Tells a Windows socket object to call the Error (see page 16) and Event (see page 17) methods.
	Loaded (see page 18)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 21) property.
	SetActive (see page 19)	Sets the Active (see page 21) property.
	SetAddress (see page 20)	Sets the Address (see page 22) property.
	SetGetSocketEvent (see page 46)	Sets the OnGetSocket (see page 54) event handler.
	SetGetThreadEvent (see page 46)	Sets the OnGetThread (see page 54) event handler.
	SetHost (see page 20)	Sets the Host (see page 22) property.
	SetOnClientError (see page 47)	Sets the OnClientError (see page 52) event handler.
	SetOnClientEvent (see page 47)	Sets the client event handlers of the associated TServerWinSocket (see page 120) object.
	SetOnThreadEnd (see page 47)	Sets the OnThreadEnd (see page 55) event handler.
	SetOnThreadStart (see page 48)	Sets the OnThreadStart (see page 55) event handler.
	SetPort (see page 20)	Sets the Port (see page 23) property.
	SetServerType (see page 48)	Sets the ServerType (see page 49) property.
	SetService (see page 21)	Sets the Service (see page 23) property.
	SetThreadCacheSize (see page 49)	Sets the ThreadCacheSize (see page 50) property.

Protected Properties

	Name	Description
	Address (see page 22)	Specifies the IP address of the server system.
	Host (see page 22)	Specifies an alias for the IP address of the server system.

Public Methods

	Name	Description
	Close (see page 16)	Shuts down the socket connection.
	Create (see page 110)	Creates an instance of TServerSocket (see page 108).
	Destroy (see page 41)	Destroys an instance of TCustomServerSocket (see page 39).
	Open (see page 19)	Opens the socket connection.

Public Properties

	Name	Description
	Socket (see page 113)	Specifies the TServerWinSocket (see page 120) object that describes the endpoint of the listening connection.

Published Events

	Name	Description
	OnAccept (see page 114)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 115)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 116)	Occurs when one of the connections to a client socket is closed.

	OnClientError (see page 116)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 117)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 117)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 118)	Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 118)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 119)	Occurs just before a server socket is opened for listening.
	OnThreadEnd (see page 119)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 120)	Occurs when the execution thread for a connection to a client socket starts up.

Published Properties

	Name	Description
	Active (see page 111)	Indicates whether the socket connection is open and available for communication with other machines.
	Port (see page 111)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 112)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 112)	Specifies the name of the service for which the socket connection is used.
	ThreadCacheSize (see page 113)	Specifies the maximum number of threads that can be reused for new client connections.

2.1.11.2 TServerSocket.Create Constructor

Creates an instance of TServerSocket (see page 108).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TServerSocket(TComponent * AOwner);
```

Description

Call Create to create and initialize a server socket component at runtime. TServerSocket (see page 108) objects placed at design time are created automatically.

After calling the inherited constructor, Create

Allocates the TServerWinSocket (see page 120) object that encapsulates the Windows socket connection for the server socket.

Initializes the event and error dispatchers for the server socket.

Initializes ThreadCacheSize (see page 113) to 10.

See Also

Create

ThreadCacheSize (see page 50)

2.1.11.3 TServerSocket Properties

The properties of the TServerSocket class are listed here.

Public Properties

	Name	Description
	Socket (see page 113)	Specifies the TServerWinSocket (see page 120) object that describes the endpoint of the listening connection.

Published Properties

	Name	Description
	Active (see page 111)	Indicates whether the socket connection is open and available for communication with other machines.
	Port (see page 111)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 112)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 112)	Specifies the name of the service for which the socket connection is used.
	ThreadCacheSize (see page 113)	Specifies the maximum number of threads that can be reused for new client connections.

2.1.11.3.1 TServerSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 16)

Open (see page 19)

SetActive (see page 19)

2.1.11.3.2 TServerSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host or Address property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets

generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError exception.

See Also

Address (see page 22)

ESocketError (see page 13)

Host (see page 22)

Service (see page 23)

SetPort (see page 20)

2.1.11.3.3 TServerSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the server socket. When ServerType is stThreadBlocking, the execution of the connection thread is suspended while reading or writing until all information has been transferred over the connection. The thread for each connection generates OnClientRead or OnClientWrite events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over the socket connections asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default. OnClientRead or OnClientWrite events occur when the client socket on the other end of one of the connections tries to send or receive information over the connection.

Use a non-blocking socket when the socket needs to synchronize reading and writing with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient... event handlers contain thread-safe code.

See Also

OnClientRead (see page 53)

OnClientWrite (see page 53)

TServerClientThread (see page 95)

2.1.11.3.4 TServerSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property UnicodeString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the server Port to use for the socket connection. For server sockets, using Service rather than Port ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError exception.

ESocketError (see page 13)

Port (see page 23)

SetService (see page 21)

LookupService (see page 75)

2.1.11.3.5 TServerSocket.Socket Property

Specifies the TServerWinSocket (see page 120) object that describes the endpoint of the listening connection.

Pascal

```
property Socket: TServerWinSocket;
```

C++

```
__property TServerWinSocket Socket;
```

Description

Use Socket to obtain

Information about the connections currently active on the server socket.

Information about the connection threads that are cached for use by the server socket.

Access to the Windows socket handle for the listening connection that is needed for Windows socket API calls.

See Also

ThreadCacheSize (see page 50)

2.1.11.3.6 TServerSocket.ThreadCacheSize Property

Specifies the maximum number of threads that can be reused for new client connections.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution

thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

ServerType (see page 49)

TServerClientThread (see page 95)

ActiveThreads (see page 130)

IdleThreads (see page 131)

2.1.11.4 TServerSocket Events

The events of the TServerSocket class are listed here.

Published Events

	Name	Description
	OnAccept (see page 114)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 115)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 116)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 116)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 117)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 117)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 118)	Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 118)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 119)	Occurs just before a server socket is opened for listening.
	OnThreadEnd (see page 119)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 120)	Occurs when the execution thread for a connection to a client socket starts up.

2.1.11.4.1 TServerSocket.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnAccept;
```

Description

Write an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that will be used in the server endpoint of the connection. The port number, and possibly the IP address, will differ from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect event occurs for the client socket.

See Also

OnConnect (see page 60)

OnListen (see page 61)

2.1.11.4.2 TServerSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the server socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write an OnClientConnect event handler to take specific action when a client socket completes the socket connection to the server socket. For example, the socket may start reading or writing over the connection in an OnClientConnect event handler.

The order of server socket events leading up to OnClientConnect is as follows:

1An OnListen event occurs just before the server socket is opened for listening.

2The server socket receives client requests in a listening queue. The server socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The server socket generates an OnGetSocket event, passing in the Windows socket handle. If a TServerClientWinSocket object for the server endpoint of the new connection is not created in an OnGetSocket event handler, the server socket creates one. The TServerWinSocket object continues to listen for other clients.

4An OnAccept event occurs, using the new TServerClientWinSocket object.

5If ServerType is stThreadBlocking and no thread is available in the cache, an OnGetThread event occurs. If the OnGetThread event handler does not create a thread, the server socket creates a TServerClientThread.

6If ServerType is stThreadBlocking, an OnThreadStart event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket object and an OnClientConnect event occurs.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientConnect event handler for TServerSocket is also set when setting the OnClientConnect event handler of the associated TServerWinSocket.

See Also

OnAccept (see page 59)

OnGetSocket (see page 54)

OnGetThread (see page 54)

OnListen (see page 61)

OnThreadStart (see page 55)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

GetClientThread (see page 127)

2.1.11.4.3 TServerSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client connection does not close the server socket. The server socket remains open and listening for client requests on its listening connection.

The TServerClientWinSocket that describes the server endpoint of the client connection is freed after OnClientDisconnect. If ServerType is stThreadBlocking, OnThreadEnd occurs after OnClientDisconnect.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientDisconnect event handler for TServerSocket is also set when setting the OnClientDisconnect event handler of the associated TServerWinSocket.

See Also

OnThreadEnd (see page 55)

ServerType (see page 49)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

GetClientThread (see page 127)

2.1.11.4.4 TServerSocket.OnClientError Event

Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write an OnClientError event handler to respond to errors that arise with a connection to an individual client. Set the ErrorCode

parameter to 0 if the OnClientError event handler successfully deals with the error condition to prevent an ESocketError from being raised.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientError event handler for TServerSocket is also set when setting the OnClientError event handler of the associated TServerWinSocket.

See Also

ESocketError (see page 13)

ServerType (see page 49)

TServerClientWinSocket (see page 104)

GetClientThread (see page 127)

2.1.11.4.5 TServerSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write an OnClientRead event handler to read from the socket connection. If the ServerType property is stThreadBlocking, use a TWinSocketStream object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, use the methods of the Socket parameter to perform the actual reading.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 49)

ReceiveBuf (see page 77)

ReceiveText (see page 78)

TServerClientWinSocket (see page 104)

GetClientThread (see page 127)

TWinSocketStream (see page 138)

2.1.11.4.6 TServerSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write an OnClientWrite event handler to write to the socket connection. If the ServerType property is stThreadBlocking, use a TWinSocketStream object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, use the methods of the Socket parameter to perform the actual writing.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 49)

SendBuf (see page 78)

SendStream (see page 79)

SendText (see page 80)

GetClientThread (see page 127)

TWinSocketStream (see page 138)

2.1.11.4.7 TServerSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write an OnGetSocket event handler to create a specialized descendant of TServerClientWinSocket for the server socket component to use. Return the new TServerClientWinSocket object in the ClientSocket parameter. The Sender parameter is the TServerWinSocket object that describes the server endpoint of the listening connection.

See Also

TServerClientWinSocket (see page 104)

Create (see page 106)

TServerWinSocket (see page 120)

2.1.11.4.8 TServerSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write an OnGetThread event handler to create a specialized descendant of TServerClientThread for the connection to the client socket. Return the new TServerClientThread object in the SocketThread parameter.

Most applications that use thread-blocking server components will want to provide an OnGetThread event handler and implement a TServerClientThread that handles its own reading and writing in a thread-safe manner rather than relying on the default TServerClientThread which triggers OnClientRead and OnClientWrite events. This is because the OnClientRead and OnClientWrite event handlers reside on the server socket, which is in global memory.

The Sender parameter is the TServerWinSocket object that describes the server endpoint of the listening connection. The ClientSocket parameter is the TServerClientWinSocket object that describes the server endpoint of the connection to the client socket that is about to be formed.

See Also

ServerType (see page 49)

TServerClientThread (see page 95)

TServerClientWinSocket (see page 104)

TServerWinSocket (see page 120)

2.1.11.4.9 TServerSocket.OnListen Event

Occurs just before a server socket is opened for listening.

Pascal

```
property OnListen: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnListen;
```

Description

Write an OnListen event handler for a server socket to take specific action just before the socket is opened for listening. OnListen occurs after Address and Port have been bound to the socket connection, but before it is opened. This is the last opportunity to make changes to the socket endpoint before it is opened for listening. Use the SocketHandle property of the Socket parameter for Windows API calls that change the socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. The connection to a client socket is completed when a request from the queue is accepted.

See Also

Accept (see page 68)

Address (see page 22)

Port (see page 23)

2.1.11.4.10 TServerSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect event.

The Sender parameter is the TServerWinSocket that describes the server endpoint of the listening connection. The Thread parameter is the thread that is finishing up.

See Also

OnClientDisconnect (see page 52)

TServerWinSocket (see page 120)

2.1.11.4.11 TServerSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write an OnThreadStart to initialize the TServerClientThread for the connection to a single client socket. The Sender parameter is the TServerWinSocket that describes the server endpoint of the listening connection. The Thread parameter is the thread that is about to start execution.

See Also

TServerClientThread (see page 95)

TServerWinSocket (see page 120)

2.1.12 TServerWinSocket Class

TServerWinSocket describes the endpoint of a listening server socket connection.

Class Hierarchy

Pascal

```
TServerWinSocket = class(TCustomWinSocket);
```

C++

```
class TServerWinSocket : public TCustomWinSocket;
```

File

ScktComp

Description

TServerWinSocket is used by server socket components to manage the Windows socket API calls for a TCP/IP listening connection. TServerWinSocket introduces new properties, events, and methods to manage multiple socket connections to different client sockets, and to generate or reuse TServerClientThread (see page 95) objects that allow each client connection to have its own execution thread.

See Also

TClientWinSocket (see page 35)

TServerClientThread (see page 95)

TServerClientWinSocket (see page 104)

TServerSocket (see page 108)

2.1.12.1 TServerWinSocket Members

The following tables list the members exposed by TServerWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 68)	Looks up information or forms socket connections asynchronously.
	ClientConnect (see page 125)	This is ClientConnect, a member of class TServerWinSocket.
	ClientDisconnect (see page 125)	This is ClientDisconnect, a member of class TServerWinSocket.
	ClientErrorEvent (see page 125)	This is ClientErrorEvent, a member of class TServerWinSocket.
	ClientRead (see page 125)	This is ClientRead, a member of class TServerWinSocket.
	ClientWrite (see page 126)	This is ClientWrite, a member of class TServerWinSocket.
	DoCreateThread (see page 126)	This is DoCreateThread, a member of class TServerWinSocket.
	DoListen (see page 70)	Opens a listening connection.
	DoOpen (see page 71)	Opens a connection to a remote socket.
	Error (see page 71)	Generates an OnErrorEvent (see page 89) event.
	Event (see page 72)	Triggers an OnSocketEvent (see page 90) event.
	GetClientSocket (see page 127)	This is GetClientSocket, a member of class TServerWinSocket.
	GetServerThread (see page 127)	This is GetServerThread, a member of class TServerWinSocket.
	InitSocket (see page 72)	Generates a windows Internet socket address structure from a description of the desired socket port.
	Listen (see page 127)	Opens a listening connection for a server socket.
	SetAsyncStyles (see page 81)	Sets the ASyncStyles (see page 83) property.
	SetServerType (see page 128)	This is SetServerType, a member of class TServerWinSocket.
	SetThreadCacheSize (see page 128)	This is SetThreadCacheSize, a member of class TServerWinSocket.
	ThreadEnd (see page 129)	This is ThreadEnd, a member of class TServerWinSocket.
	ThreadStart (see page 129)	This is ThreadStart, a member of class TServerWinSocket.

Public Events

	Name	Description
	OnClientConnect (see page 133)	Occurs when a client socket completes a connection accepted by the listening socket.
	OnClientDisconnect (see page 134)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 135)	Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 135)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 136)	Occurs when the server socket should write information to a client socket.
	OnErrorEvent (see page 89)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnGetSocket (see page 137)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to form the connection to a client socket.

	OnGetThread (see page 137)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnSocketEvent (see page 90)	Occurs when the Windows socket receives notification of asynchronous events.
	OnThreadEnd (see page 138)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 138)	Occurs when the execution thread for a connection to a client socket starts up.

Public Methods

	Name	Description
V	Accept (see page 124)	Accepts a connection to a client socket.
	Close (see page 69)	Shuts down the socket connection if it is open.
V	Connect (see page 69)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 123)	Creates an instance of TServerWinSocket (see page 120) from a Windows socket handle.
V	DefaultHandler (see page 70)	Processes message records.
V	Destroy (see page 123)	Destroys an instance of TServerWinSocket (see page 120).
V	Disconnect (see page 126)	Shuts down the socket connection represented by a Windows socket handle.
	GetClientThread (see page 127)	Returns the execution thread used by the client connection managed by the ClientSocket parameter.
	Lock (see page 74)	Starts a critical section, blocking all other execution threads until the Unlock (see page 81) method is called.
	LookupName (see page 74)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 75)	Returns the port number associated with a specific service.
	Open (see page 75)	Opens a connection to a remote socket.
V	Read (see page 76)	Generates an OnSocketEvent (see page 90) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 77)	Reads up to Count bytes from the socket connection into the Buf parameter.
	ReceiveLength (see page 77)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 78)	Reads a string from the socket connection.
	SendBuf (see page 78)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection.
	SendStreamThenDrop (see page 79)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 80)	Writes the string S to the socket connection.
	Unlock (see page 81)	Reenables execution in other threads after a critical section begun by the Lock (see page 74) method.
V	Write (see page 81)	Generates an OnSocketEvent (see page 90) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	ActiveConnections (see page 129)	Indicates the number of connections to client sockets accepted by this listening socket that are currently open.
R	ActiveThreads (see page 130)	Indicates the number of TServerClientThread (see page 95) objects currently in use by the socket connections listed in the Connections (see page 130) array.
R	Addr (see page 82)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 83)	Determines which asynchronous events the socket can receive.
R	Connected (see page 83)	Indicates whether the socket connection is open and available for communication with other machines.
R	Connections (see page 130)	Lists all TServerClientWinSocket (see page 104) objects that represent open socket connections to client sockets that were accepted by this listening socket.
	Data (see page 84)	Points to application-specific data associated with the socket.
R	Handle (see page 84)	Specifies the handle of the window that receives notifications from the Windows socket.

	IdleThreads (see page 131)	Indicates the number of unused TServerClientThread (see page 95) objects available in the cache.
	LocalAddress (see page 85)	Specifies the IP address of the local system that was bound to the socket connection.
	LocalHost (see page 85)	Specifies the name of the local system.
	LocalPort (see page 86)	Specifies the ID number of the port used by the socket connection.
	LookupState (see page 86)	Indicates any asynchronous activities occurring while opening a connection.
	RemoteAddr (see page 87)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
	RemoteAddress (see page 87)	Specifies the IP address of the remote system that was bound to the socket connection.
	RemoteHost (see page 88)	Specifies the name of the remote system.
	RemotePort (see page 88)	Specifies the ID number of the port used by the RemoteHost (see page 88) to form the socket connection.
	ServerType (see page 131)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	SocketHandle (see page 89)	Specifies the Windows handle for the socket.
	ThreadCacheSize (see page 132)	Indicates the number of TServerClientThread (see page 95) objects cached for reuse by new connections to client sockets.

2.1.12.2 TServerWinSocket.Create Constructor

Creates an instance of TServerWinSocket (see page 120) from a Windows socket handle.

Pascal

```
constructor Create(ASocket: TSocket);
```

C++

```
__fastcall TServerWinSocket(TSocket ASocket);
```

Description

Call Create to create a Windows listening socket object. Windows listening socket objects are created automatically by the server socket component that uses them.

Create allocates the helper objects that manage the list of active client connections and the thread cache before calling the inherited constructor. Create also initializes the ASyncStyles (see page 83) property to [asAccept].

See Also

ASyncStyles (see page 83)

Connections (see page 130)

Create (see page 66)

2.1.12.3 TServerWinSocket.Destroy Destructor

Destroys an instance of TServerWinSocket (see page 120).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerWinSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the Windows listening socket object is not nil,

and only then calls Destroy. Unless the Windows socket object is not used by a server socket component, it is freed automatically by the socket component.

Destroy frees the helper objects that manage the list of active client connections and the thread cache.

See Also

System::TObject::Free (see page 3372)

TServerSocket (see page 108)

2.1.12.4 TServerWinSocket Methods

The methods of the TServerWinSocket class are listed here.

Protected Methods

	Name	Description
	ClientConnect (see page 125)	This is ClientConnect, a member of class TServerWinSocket.
	ClientDisconnect (see page 125)	This is ClientDisconnect, a member of class TServerWinSocket.
	ClientErrorEvent (see page 125)	This is ClientErrorEvent, a member of class TServerWinSocket.
	ClientRead (see page 125)	This is ClientRead, a member of class TServerWinSocket.
	ClientWrite (see page 126)	This is ClientWrite, a member of class TServerWinSocket.
	DoCreateThread (see page 126)	This is DoCreateThread, a member of class TServerWinSocket.
	GetClientSocket (see page 127)	This is GetClientSocket, a member of class TServerWinSocket.
	GetServerThread (see page 127)	This is GetServerThread, a member of class TServerWinSocket.
	Listen (see page 127)	Opens a listening connection for a server socket.
	SetServerType (see page 128)	This is SetServerType, a member of class TServerWinSocket.
	SetThreadCacheSize (see page 128)	This is SetThreadCacheSize, a member of class TServerWinSocket.
	ThreadEnd (see page 129)	This is ThreadEnd, a member of class TServerWinSocket.
	ThreadStart (see page 129)	This is ThreadStart, a member of class TServerWinSocket.

Public Methods

	Name	Description
	Accept (see page 124)	Accepts a connection to a client socket.
	Disconnect (see page 126)	Shuts down the socket connection represented by a Windows socket handle.
	GetClientThread (see page 127)	Returns the execution thread used by the client connection managed by the ClientSocket parameter.

2.1.12.4.1 TServerWinSocket.Accept Method

Accepts a connection to a client socket.

Pascal

```
procedure Accept(Socket: TSocket); override;
```

C++

```
virtual __fastcall Accept(TSocket Socket);
```

Description

Accept is called automatically in response to notifications that a client socket is requesting a connection. The Socket parameter is the Windows socket handle for the listening connection.

Accept accepts the client connection request, obtaining the Windows socket handle for the client connection. It then generates an OnGetSocket (see page 137) event, passing this socket handle as an argument to any event handler. If a TServerClientWinSocket (see page 104) is not created by an OnGetSocket (see page 137) event handler, Accept creates a TServerClientWinSocket (see page 104) to represent the server endpoint of the accepted connection. Next, Accept obtains a

running TServerClientThread (see page 95), either by restarting a thread in the cache, obtaining one from an OnGetThread (see page 137) event, or creating a new TServerClientThread (see page 95) object. This new thread handles the connection to the client socket.

Accept is only called if the ASyncStyles (see page 83) property includes asAccept.

See Also

ASyncStyles (see page 83)

OnGetSocket (see page 137)

OnGetThread (see page 137)

2.1.12.4.2 TServerWinSocket.ClientConnect Method

Pascal

```
procedure ClientConnect(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientConnect(TCustomWinSOcket Socket);
```

Description

This is ClientConnect, a member of class TServerWinSocket.

2.1.12.4.3 TServerWinSocket.ClientDisconnect Method

Pascal

```
procedure ClientDisconnect(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientDisconnect(TCustomWinSOcket Socket);
```

Description

This is ClientDisconnect, a member of class TServerWinSocket.

2.1.12.4.4 TServerWinSocket.ClientErrorEvent Method

Pascal

```
procedure ClientErrorEvent(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode:
Integer); dynamic;
```

C++

```
__fastcall ClientErrorEvent(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

This is ClientErrorEvent, a member of class TServerWinSocket.

2.1.12.4.5 TServerWinSocket.ClientRead Method

Pascal

```
procedure ClientRead(Socket: TCustomWinSocket); dynamic;
```

C++

```
__fastcall ClientRead(TCustomWinSocket Socket);
```

Description

This is ClientRead, a member of class TServerWinSocket.

2.1.12.4.6 TServerWinSocket.ClientWrite Method

Pascal

```
procedure ClientWrite(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientWrite(TCustomWinSOcket Socket);
```

Description

This is ClientWrite, a member of class TServerWinSocket.

2.1.12.4.7 TServerWinSocket.Disconnect Method

Shuts down the socket connection represented by a Windows socket handle.

Pascal

```
procedure Disconnect(Socket: TSocket); override;
```

C++

```
virtual __fastcall Disconnect(TSocket Socket);
```

Description

Disconnect is called by the Close (see page 69) method to terminate the socket connection.

Disconnect calls the Lock (see page 74) method to make sure the method is thread-safe. Then, it terminates all open connections to client sockets. Next it generates an OnSocketEvent (see page 90) of type seDisconnect. Finally, it closes the listening connection and calls Unlock (see page 81) to end the critical section started by Lock (see page 74).

See Also

Close (see page 69)

Lock (see page 74)

OnSocketEvent (see page 90)

Unlock (see page 81)

2.1.12.4.8 TServerWinSocket.DoCreateThread Method

Pascal

```
function DoCreateThread(ClientSocket: TServerClientWinSocket): TServerClientThread; virtual;
```

C++

```
virtual __fastcall TServerClientThread DoCreateThread(TServerClientWinSocket ClientSocket);
```

Description

This is DoCreateThread, a member of class TServerWinSocket.

2.1.12.4.9 TServerWinSocket.GetClientSocket Method

Pascal

```
function GetClientSocket(Socket: TSocket): TServerClientWinSocket; dynamic;
```

C++

```
__fastcall TServerClientWinSocket GetClientSocket(TSocket Socket);
```

Description

This is GetClientSocket, a member of class TServerWinSocket.

2.1.12.4.10 TServerWinSocket.GetClientThread Method

Returns the execution thread used by the client connection managed by the ClientSocket parameter.

Pascal

```
function GetClientThread(ClientSocket: TServerClientWinSocket): TServerClientThread;
```

C++

```
__fastcall TServerClientThread GetClientThread(TServerClientWinSocket ClientSocket);
```

Description

Use GetClientThread to obtain access to the TServerClientThread (see page 95) for a particular client connection. GetClientThread allows an OnClient... event handler to access thread-global information saved in the Data (see page 84) property of the thread.

See Also

OnClientConnect (see page 133)

OnClientDisconnect (see page 134)

OnClientError (see page 135)

OnClientRead (see page 135)

OnClientWrite (see page 136)

Data (see page 103)

2.1.12.4.11 TServerWinSocket.GetServerThread Method

Pascal

```
function GetServerThread(ClientSocket: TServerClientWinSocket): TServerClientThread; dynamic;
```

C++

```
__fastcall TServerClientThread GetServerThread(TServerClientWinSocket ClientSocket);
```

Description

This is GetServerThread, a member of class TServerWinSocket.

2.1.12.4.12 TServerWinSocket.Listen Method

Opens a listening connection for a server socket.

Pascal

```
procedure Listen(var Name: string; var Address: string; var Service: string; Port: Word;
QueueSize: Integer);
```

C++

```
__fastcall Listen(UnicodeString Name, UnicodeString Address, UnicodeString Service, Word Port,
int QueueSize);
```

Description

Server socket components call Listen to open a listening connection.

Listen creates the Windows socket that will make the listening connection, and binds the Windows Internet socket address derived from the parameters to the socket. Listen then generates an OnSocketEvent (see page 90) of type seListen. Finally, Listen opens the socket as a listening connection with a queue that can hold QueueSize client requests, setting the Connected (see page 83) property to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the server socket component. The QueueSize is set to 5 by TServerSocket (see page 108).

See Also

Connected (see page 83)

InitSocket (see page 72)

OnSocketEvent (see page 90)

Address (see page 22)

Host (see page 22)

Port (see page 23)

Service (see page 23)

TServerSocket (see page 108)

2.1.12.4.13 TServerWinSocket.SetServerType Method

Pascal

```
procedure SetServerType(Value: TServerType);
```

C++

```
__fastcall SetServerType(TServerType Value);
```

Description

This is SetServerType, a member of class TServerWinSocket.

2.1.12.4.14 TServerWinSocket.SetThreadCacheSize Method

Pascal

```
procedure SetThreadCacheSize(Value: Integer);
```

C++

```
__fastcall SetThreadCacheSize(int Value);
```

Description

This is SetThreadCacheSize, a member of class TServerWinSocket.

2.1.12.4.15 TServerWinSocket.ThreadEnd Method

Pascal

```
procedure ThreadEnd(AThread: TServerClientThread); dynamic;
```

C++

```
__fastcall ThreadEnd(TServerClientThread AThread);
```

Description

This is ThreadEnd, a member of class TServerWinSocket.

2.1.12.4.16 TServerWinSocket.ThreadStart Method

Pascal

```
procedure ThreadStart(AThread: TServerClientThread); dynamic;
```

C++

```
__fastcall ThreadStart(TServerClientThread AThread);
```

Description

This is ThreadStart, a member of class TServerWinSocket.

2.1.12.5 TServerWinSocket Properties

The properties of the TServerWinSocket class are listed here.

Public Properties

	Name	Description
R	ActiveConnections (see page 129)	Indicates the number of connections to client sockets accepted by this listening socket that are currently open.
R	ActiveThreads (see page 130)	Indicates the number of TServerClientThread (see page 95) objects currently in use by the socket connections listed in the Connections (see page 130) array.
R	Connections (see page 130)	Lists all TServerClientWinSocket (see page 104) objects that represent open socket connections to client sockets that were accepted by this listening socket.
R	IdleThreads (see page 131)	Indicates the number of unused TServerClientThread (see page 95) objects available in the cache.
	ServerType (see page 131)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	ThreadCacheSize (see page 132)	Indicates the number of TServerClientThread (see page 95) objects cached for reuse by new connections to client sockets.

2.1.12.5.1 TServerWinSocket.ActiveConnections Property

Indicates the number of connections to client sockets accepted by this listening socket that are currently open.

Pascal

```
property ActiveConnections: Integer;
```

C++

```
__property int ActiveConnections;
```

Description

Use ActiveConnections to monitor the use of the server socket. ActiveConnections is the number of entries in the Connections

(see page 130) array.

See Also

Connections (see page 130)

2.1.12.5.2 TServerWinSocket.ActiveThreads Property

Indicates the number of TServerClientThread (see page 95) objects currently in use by the socket connections listed in the Connections (see page 130) array.

Pascal

```
property ActiveThreads: Integer;
```

C++

```
__property int ActiveThreads;
```

Description

Use ActiveThreads to monitor thread usage by the listening socket. If ActiveThreads is usually much higher than ThreadCacheSize (see page 132), increasing ThreadCacheSize (see page 132) should improve performance. To determine whether ThreadCacheSize (see page 132) is too high, use the IdleThreads (see page 131) property.

When the ServerType (see page 131) property is stThreadBlocking, each client connection automatically spawns a thread which is added to the cache and counted by ActiveThreads.

See Also

Connections (see page 130)

GetClientThread (see page 127)

IdleThreads (see page 131)

ServerType (see page 131)

ThreadCacheSize (see page 132)

2.1.12.5.3 TServerWinSocket.Connections Property

Lists all TServerClientWinSocket (see page 104) objects that represent open socket connections to client sockets that were accepted by this listening socket.

Pascal

```
property Connections [Index: Integer]: TCustomWinSocket;
```

C++

```
__property TCustomWinSocket Connections[int Index];
```

Description

Use Connections with the ActiveConnections (see page 129) property to iterate over all open socket connections accepted by the listening socket. Each entry in the Connections array is a TServerClientWinSocket (see page 104) object, where an Index of 0 gives the first TServerClientWinSocket (see page 104), an Index of 1 returns the second TServerClientWinSocket (see page 104), and so on.

If ServerType (see page 131) is stThreadBlocking, the thread associated with each of the TServerClientWinSocket (see page 104) objects in the Connections array can be obtained using the GetClientThread (see page 127) method.

See Also

ActiveConnections (see page 129)

GetClientThread (see page 127)

ServerType (see page 131)

TServerClientWinSocket (see page 104)

2.1.12.5.4 TServerWinSocket.IdleThreads Property

Indicates the number of unused TServerClientThread (see page 95) objects available in the cache.

Pascal

```
property IdleThreads: Integer;
```

C++

```
__property int IdleThreads;
```

Description

Use IdleThreads to monitor thread cache usage by the listening socket. If IdleThreads often very high, the thread cache is tying up a lot of unused memory storing extra threads. Monitor the ActiveThreads (see page 130) property to determine an appropriate value for ThreadCacheSize (see page 132).

When the ServerType (see page 131) property is stThreadBlocking, each client connection automatically spawns a thread which is added to the cache. As the threads in the cache complete their execution, they become available for reuse, and are counted by IdleThreads. When there are more active threads than ThreadCacheSize (see page 132), the extra threads are freed when they finish execution instead.

See Also

ActiveThreads (see page 130)

ServerType (see page 131)

ThreadCacheSize (see page 132)

2.1.12.5.5 TServerWinSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the listening socket connection. When ServerType is stThreadBlocking, the TServerClientThread (see page 95) object for a connection generates OnClientRead (see page 135) or OnClientWrite (see page 136) events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over socket connections accepted by the listening socket asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default.

OnClientRead (see page 135) or OnClientWrite (see page 136) events occur when the server socket needs to attend to I/O over one of the connections.

Use a non-blocking socket when reading and writing must be synchronized with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient...

event handlers contain thread-safe code.

See Also

ASyncStyles (see page 83)

OnClientRead (see page 135)

OnClientWrite (see page 136)

OnGetThread (see page 137)

TServerClientThread (see page 95)

2.1.12.5.6 TServerWinSocket.ThreadCacheSize Property

Indicates the number of TServerClientThread (see page 95) objects cached for reuse by new connections to client sockets.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType (see page 131) is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New (see page 3619) connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

See Also

ActiveThreads (see page 130)

IdleThreads (see page 131)

ServerType (see page 131)

2.1.12.6 TServerWinSocket Events

The events of the TServerWinSocket class are listed here.

Public Events

	Name	Description
	OnClientConnect (see page 133)	Occurs when a client socket completes a connection accepted by the listening socket.
	OnClientDisconnect (see page 134)	Occurs when one of the connections to a client socket is closed.

	OnClientError (see page 135)	Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 135)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 136)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 137)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to form the connection to a client socket.
	OnGetThread (see page 137)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnThreadEnd (see page 138)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 138)	Occurs when the execution thread for a connection to a client socket starts up.

2.1.12.6.1 TServerWinSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the listening socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write (see page 81) an OnClientConnect event handler to take specific action when a client socket completes the socket connection to a TServerClientWinSocket (see page 104) object. Depending on the service, this is the point when the socket should begin reading or writing.

The order of Windows server socket events leading up to OnClientConnect is as follows:

1An OnSocketEvent (see page 90) event of type seListen occurs just before the Windows socket is opened for listening.

2The listening Windows socket receives client requests in a listening queue. The listening socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The listening socket generates an OnGetSocket (see page 137) event, passing in the Windows socket handle. If a TServerClientWinSocket (see page 104) object for the Windows socket handle was not created in the OnGetSocket (see page 137) event handler, the Windows socket creates one. The Windows socket continues to listen for other clients.

4An OnSocketEvent (see page 90) event of type seAccept occurs, using the new TServerClientWinSocket (see page 104) object.

5If ServerType (see page 131) is stThreadBlocking and no thread is available in the cache, an OnGetThread (see page 137) event occurs. If the OnGetThread (see page 137) event handler does not create a thread, the Windows socket object creates a TServerClientThread (see page 95).

6If ServerType (see page 131) is stThreadBlocking, an OnThreadStart (see page 138) event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket (see page 104) object and an OnClientConnect event occurs.

The Sender parameter is the TServerWinClient object that listens for client requests. The Socket parameter is the TServerClientWinSocket (see page 104) object that forms a connection to the client socket.

Note: If ServerType (see page 131) is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread (see page 127) method to access thread-specific information.

Note: The OnClientConnect event handler for TServerWinSocket (see page 120) is also set when setting the

OnClientConnect event handler of the associated TServerSocket (see page 108).

See Also

GetClientThread (see page 127)

OnGetSocket (see page 137)

OnGetThread (see page 137)

OnSocketEvent (see page 90)

OnThreadStart (see page 138)

ServerType (see page 131)

TServerClientWinSocket (see page 104)

OnClientConnect (see page 51)

2.1.12.6.2 TServerWinSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write (see page 81) an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client request does not close the listening socket. The listening connection remains open for accepting new client connection requests.

The TServerClientWinSocket (see page 104) object associated with the client connection is freed after OnClientDisconnect. If ServerType (see page 131) is stThreadBlocking, OnThreadEnd (see page 138) occurs after OnClientDisconnect.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 104) object that is ending a connection with the client socket.

Note: If ServerType (see page 131) is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe.Use the GetClientThread (see page 127) method to access thread-specific information.

The OnClientDisconnect event handler for TServerWinSocket (see page 120) is also set when setting the OnClientDisconnect event handler of the associated TServerSocket (see page 108).

See Also

GetClientThread (see page 127)

OnThreadEnd (see page 138)

ServerType (see page 131)

TServerClientWinSocket (see page 104)

OnClientDisconnect (see page 52)

2.1.12.6.3 TServerWinSocket.OnClientError Event

Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write (see page 81) an OnClientError event handler to respond to errors that arise with the connection to a client socket. Set the ErrorCode parameter to 0 if the OnClientError event handler successfully deals with the error condition, to prevent an ESocketError (see page 13) from being raised.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 104) object that manages the connection to the client. The ErrorEvent parameter indicates what Socket was attempting to do when the error occurred. The ErrorCode parameter is the error code returned by the Windows socket API call.

Note: If ServerType (see page 131) is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread (see page 127) method to access thread-specific information.

Note: The OnClientError event handler for TServerWinSocket (see page 120) is also set when setting the OnClientError event handler of the associated TServerSocket (see page 108).

See Also

ESocketError (see page 13)

GetClientThread (see page 127)

ServerType (see page 131)

TServerClientWinSocket (see page 104)

OnClientError (see page 52)

2.1.12.6.4 TServerWinSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write (see page 81) an OnClientRead event handler to read from the socket connection. Use a TWinSocketStream (see page 138) object or the methods of the Socket parameter to do the reading.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 104) object that encapsulates the Windows socket connection.

Note: If ServerType (see page 131) is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread (see page 127) method to access thread-specific information.

Note: The OnClientRead event handler for TServerWinSocket (see page 120) is also set when setting the OnClientRead event handler of the associated TServerSocket (see page 108).

See Also

GetClientThread (see page 127)

ReceiveBuf (see page 77)

ReceiveText (see page 78)

TServerClientWinSocket (see page 104)

OnClientRead (see page 53)

TWinSocketStream (see page 138)

2.1.12.6.5 TServerWinSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write (see page 81) an OnClientWrite event handler to write to the socket connection. Use a TWinSocketStream (see page 138) object or the methods of the Socket parameter to do the actual writing.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 104) object that encapsulates the Windows socket connection.

Note: If ServerType (see page 131) is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread (see page 127) method to access thread-specific information.

Note: The OnClientWrite event handler for TServerWinSocket (see page 120) is also set when setting the OnClientWrite event handler of the associated TServerSocket (see page 108).

See Also

GetClientThread (see page 127)

ServerType (see page 131)

SendBuf (see page 78)

SendStream (see page 79)

SendText (see page 80)

OnClientWrite (see page 53)

2.1.12.6.6 TServerWinSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket (see page 104) object to form the connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write (see page 81) an OnGetSocket event handler to create a specialized TServerClientWinSocket (see page 104) object to use in the connection represented by the Socket parameter. Return the new TServerClientWinSocket (see page 104) object in the ClientSocket parameter.

The Sender parameter is the TServerWinSocket (see page 120) object that received the client request. The Socket parameter is the Windows socket handle for the socket connection to the client socket.

Note: The OnGetSocket event handler for TServerWinSocket (see page 120) is also set when setting the OnGetSocket event handler of the associated TServerSocket (see page 108).

See Also

Create (see page 106)

OnGetSocket (see page 54)

2.1.12.6.7 TServerWinSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write (see page 81) an OnGetThread event handler to create a specialized descendant of TServerClientThread (see page 95) for the connection to the client socket. Create (see page 123) the new thread with the CreateSuspended parameter set to false, and return it in the SocketThread parameter. OnGetThread only occurs if there are no idle threads in the cache.

Most applications that use thread-blocking connections will want to create a new descendant of TServerClientThread (see page 95) in an OnGetThread event handler. This is because the default behavior of TServerClientThread (see page 95) uses the OnClientRead (see page 135) and OnClientWrite (see page 136) event handlers for reading and writing. These events occur on the server socket, which is not thread-local.

The Sender parameter is the TServerWinSocket (see page 120) object that received the client request. The ClientSocket parameter is the TServerClientWinSocket (see page 104) object that will communicate with the client socket.

Note: The OnGetThread event handler for TServerWinSocket (see page 120) is also set when setting the OnGetThread event handler of the associated TServerSocket (see page 108).

See Also

IdleThreads (see page 131)

ServerType (see page 131)

OnGetThread (see page 54)

2.1.12.6.8 TServerWinSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write (see page 81) an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect (see page 134) event.

The Sender parameter is the TServerWinSocket (see page 120) that received the client request. The Thread parameter is the thread that is finishing up.

Note: The OnThreadEnd event handler for TServerWinSocket (see page 120) is also set when setting the OnThreadEnd event handler of the associated TServerSocket (see page 108).

See Also

OnClientDisconnect (see page 134)

OnThreadEnd (see page 55)

2.1.12.6.9 TServerWinSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write (see page 81) an OnThreadStart to initialize the TServerClientThread (see page 95) for the connection to a single client socket. The Sender parameter is the TServerWinSocket (see page 120) that received the client request. The Thread parameter is the thread that is about to start execution.

Note: The OnThreadStart event handler for TServerWinSocket (see page 120) is also set when setting the OnThreadStart event handler of the associated TServerSocket (see page 108).

See Also

OnThreadStart (see page 55)

2.1.13 TWinSocketStream Class

TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

Class Hierarchy

Pascal

```
TWinSocketStream = class(TStream);
```

C++

```
class TWinSocketStream : public TStream;
```

File

ScktComp

Description

Use TWinSocketStream to read or write information over a blocking socket connection. Windows socket objects include methods to read from or write to the socket connection they represent. However, these methods do not provide a mechanism for timing out when the socket connection is dropped or for waiting until the socket connection is ready before reading.

When the socket is a non-blocking socket, this lack of a time-out or waiting mechanism is not a problem, because reading and writing occur asynchronously in response to notifications from the socket connection. For blocking sockets, however, these mechanisms provided by TWinSocketStream are necessary so that the application using the socket does not hang indefinitely.

To use a Windows socket stream, create an instance of TWinSocketStream, use the methods of the stream to read or write the data, and then free the Windows socket stream.

Note: TWinSocketStream does not work with non-blocking sockets.

See Also

TClientSocket (see page 24)

TClientWinSocket (see page 35)

TServerClientWinSocket (see page 104)

TServerSocket (see page 108)

2.1.13.1 TWinSocketStream Members

The following tables list the members exposed by TWinSocketStream.

Public Methods

	Name	Description
	Create (see page 140)	Creates an instance of TWinSocketStream (see page 138) for a Windows socket object.
	Destroy (see page 140)	Destroys an instance of TWinSocketStream (see page 138).
	Read (see page 141)	Reads up to Count bytes from the socket connection into Buffer.
	Seek (see page 141)	Always returns 0.
	WaitForData (see page 142)	Waits up to TimeOut (see page 143) milliseconds for the socket connection to be ready to transfer data.
	Write (see page 142)	Writes Count bytes from Buffer to the socket connection.

Public Properties

	Name	Description
	TimeOut (see page 143)	Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

2.1.13.2 TWinSocketStream.Create Constructor

Creates an instance of TWinSocketStream (see page 138) for a Windows socket object.

Pascal

```
constructor Create(ASocket: TCustomWinSocket; TimeOut: Longint);
```

C++

```
__fastcall TWinSocketStream(TCustomWinSocket ASocket, Longint TimeOut);
```

Description

Call Create to obtain an instance of TWinSocketStream (see page 138) for reading from or writing to the socket connection represented by the ASocket parameter. ASocket should be the endpoint of an open blocking socket connection to another Windows socket.

Create associates the stream with the socket connection, and allocates helper objects to allow it to determine when the socket connection is ready for reading or writing. The TimeOut (see page 143) property (the number of milliseconds before a read or write operation aborts) is initialized to the value of the TimeOut (see page 143) parameter.

If ASocket represents a non-blocking socket connection, Create raises an ESocketError (see page 13) exception.

See Also

ESocketError (see page 13)

ClientType (see page 38)

TCustomWinSocket (see page 64)

ServerType (see page 131)

TimeOut (see page 143)

2.1.13.3 TWinSocketStream.Destroy Destructor

Destroys an instance of TWinSocketStream (see page 138).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWinSocketStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TWinSocketStream (see page 138) reference is not nil and only then calls Destroy.

Free the TWinSocketStream (see page 138) object when it is no longer needed for reading from or writing to the socket connection.

Destroy frees the helper objects allocated in the Create (see page 140) method before calling the default destructor.

See Also

Create (see page 140)

System::TObject::Free (see page 3372)

2.1.13.4 TWinSocketStream Methods

The methods of the TWinSocketStream class are listed here.

Public Methods

	Name	Description
	Read (see page 141)	Reads up to Count bytes from the socket connection into Buffer.
	Seek (see page 141)	Always returns 0.
	WaitForData (see page 142)	Waits up to TimeOut (see page 143) milliseconds for the socket connection to be ready to transfer data.
	Write (see page 142)	Writes Count bytes from Buffer to the socket connection.

2.1.13.4.1 TWinSocketStream.Read Method

Reads up to Count bytes from the socket connection into Buffer.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Use Read to read data from the socket connection when the number of bytes to be transferred is unknown. Buffer must have at least Count bytes allocated to hold the data that is read from the connection. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read may return 0 if the socket connection is extremely slow and the read operation has not completed after TimeOut (see page 143) milliseconds. This ensures that the Read method does not hang indefinitely when a problem occurs with the socket connection.

To guard against the Read method timing out because of a slow connection, set Count fairly low, and make several calls to Read, rather than fewer calls with a large value of Count.

To ensure that the socket connection is ready to send data before calling Read, use the WaitForData (see page 142) method.

Unlike the ReadBuffer method, Read does not raise an exception if Count bytes are not read from the socket connection.

See Also

ReadBuffer

WaitForData (see page 142)

Write (see page 142)

TimeOut (see page 143)

2.1.13.4.2 TWinSocketStream.Seek Method

Always returns 0.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Seek overrides the inherited method to always set the Position property of the TWinSocketStream (see page 138) object to 0. Socket connections do not support random access. The Position property of a Windows socket stream can only reflect the position at the beginning of all remaining data.

See Also

Position

2.1.13.4.3 TWinSocketStream.WaitForData Method

Waits up to TimeOut (see page 143) milliseconds for the socket connection to be ready to transfer data.

Pascal

```
function WaitForData(Timeout: Longint): Boolean;
```

C++

```
__fastcall Boolean WaitForData(Longint Timeout);
```

Description

Call WaitForData to ensure that the socket connection is ready to read or write information. WaitForData returns true if the socket connection is ready. WaitForData returns false if the socket connection is not ready after TimeOut (see page 143) milliseconds elapse.

Call WaitForData before reading or writing information over the socket connection. Otherwise, Read (see page 141) or Write (see page 142) method calls may time out before any data is transferred.

See Also

Read (see page 141)

Write (see page 142)

2.1.13.4.4 TWinSocketStream.Write Method

Writes Count bytes from Buffer to the socket connection.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write data from a Buffer to the socket connection. Write returns the number of bytes transferred.

Write may return 0 if the socket connection is extremely slow and the write operation has not completed after TimeOut (see page 143) milliseconds. This ensures that the Write method does not hang indefinitely when a problem occurs with the socket connection.

To guard against the Write method timing out because of a slow connection, set Count fairly low, and make several calls to Write, rather than fewer calls with a large value of Count.

Unlike the WriteBuffer method, Write does not raise an exception if Count bytes are not written. For example, if the connection is

too slow to transfer all the data, Write will return 0, where WriteBuffer will raise an exception.

See Also

Read (see page 141)

WaitForData (see page 142)

WriteBuffer

TimeOut (see page 143)

2.1.13.5 TWinSocketStream Properties

The properties of the TWinSocketStream class are listed here.

Public Properties

	Name	Description
	TimeOut (see page 143)	Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

2.1.13.5.1 TWinSocketStream.TimeOut Property

Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

Pascal

```
property TimeOut: Longint;
```

C++

```
__property Longint TimeOut;
```

Description

Set TimeOut to the amount of time that should elapse before a read or write operation aborts under the assumption that the socket connection has failed.

See Also

Read (see page 141)

Write (see page 142)

2.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	SetErrorProc (see page 144)	Replaces the exception handler for error messages that are received from a Windows socket connection.

2.2.1 ScktComp.SetErrorProc Function

Replaces the exception handler for error messages that are received from a Windows socket connection.

Pascal

```
function SetErrorProc(ErrorProc: TSocketErrorProc): TSocketErrorProc;
```

C++

```
TSocketErrorProc SetErrorProc(TSocketErrorProc ErrorProc);
```

File

ScktComp

Description

Call SetErrorProc to assign an exception handler for error messages from Windows socket API calls. By default, socket components have no special error handler and simply raise an ESocketError (see page 13) exception when they receive error messages. If an exception handler is assigned using SetErrorProc, the socket component does not raise this exception.

The ErrorProc (see page 3818) parameter specifies the exception handler. It is passed the Windows socket error code. Inside this exception handler an application can compensate for the error or raise an exception. Passing a value of nil (Delphi) or NULL (C++) for the ErrorProc (see page 3818) parameter restores the default behavior, where the socket component raises an ESocketError (see page 13) exception.

SetErrorProc returns the current exception handler. This value is nil (Delphi) or NULL (C++) when SetErrorProc is called for the first time, and is the value of the ErrorProc (see page 3818) parameter from the previous invocation of SetErrorProc thereafter.

See Also

ESocketError (see page 13)

2.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAsyncStyle (see page 145)	This is record SckttComp.TAsyncStyle.
	TClientType (see page 146)	This is record SckttComp.TClientType.
	TErrorEvent (see page 147)	This is record SckttComp.TErrorEvent.
	TLookupState (see page 148)	This is record SckttComp.TLookupState.
	TServerType (see page 148)	This is record SckttComp.TServerType.
	TSocketEvent (see page 148)	TSocketEvent identifies the operation that a socket is performing.

Records

	Name	Description
	TCMLookupComplete (see page 146)	This is record SckttComp.TCMLookupComplete.
	TCMSocketMessage (see page 147)	This is record SckttComp.TCMSocketMessage.

2.3.1 SckttComp.TAsyncStyle Enumeration

Pascal

```
TAsyncStyle = (
  asRead,
  asWrite,
  asOOB,
  asAccept,
  asConnect,
  asClose
);
```

C++

```
enum TAsyncStyle {
  asRead,
  asWrite,
  asOOB,
  asAccept,
  asConnect,
  asClose
};
```

File

SckttComp

Description

This is record SckttComp.TAsyncStyle.

2.3.2 ScktComp.TClientType Enumeration

Pascal

```
TClientType = (
  ctNonBlocking,
  ctBlocking
);
```

C++

```
enum TClientType {
  ctNonBlocking,
  ctBlocking
};
```

File

ScktComp

Description

This is record ScktComp.TClientType.

2.3.3 ScktComp.TCMLookupComplete Record

Pascal

```
TCMLookupComplete = record
  Msg: Cardinal;
  LookupHandle: THandle;
  AsyncBufLen: Word;
  AsyncError: Word;
  Result: Longint;
end;
```

C++

```
struct TCMLookupComplete {
  unsigned Msg;
  THandle LookupHandle;
  Word AsyncBufLen;
  Word AsyncError;
  Longint Result;
};
```

File

ScktComp

Description

This is record ScktComp.TCMLookupComplete.

2.3.4 SocktComp.TCMSocketMessage Record

Pascal

```
TCMSocketMessage = record
  Msg: Cardinal;
  Socket: TSocket;
  SelectEvent: Word;
  SelectError: Word;
  Result: Longint;
end;
```

C++

```
struct TCMSocketMessage {
  unsigned Msg;
  TSocket Socket;
  Word SelectEvent;
  Word SelectError;
  Longint Result;
};
```

File

SocktComp

Description

This is record SocktComp.TCMSocketMessage.

2.3.5 SocktComp.TErrorEvent Enumeration

Pascal

```
TErrorEvent = (
  eeGeneral,
  eeSend,
  eeReceive,
  eeConnect,
  eeDisconnect,
  eeAccept,
  eeLookup
);
```

C++

```
enum TErrorEvent {
  eeGeneral,
  eeSend,
  eeReceive,
  eeConnect,
  eeDisconnect,
  eeAccept,
  eeLookup
};
```

File

SocktComp

Description

This is record ScktComp.TErrorEvent.

2.3.6 SocktComp.TLookupState Enumeration

Pascal

```
TLookupState = (
  lsIdle,
  lsLookupAddress,
  lsLookupService
);
```

C++

```
enum TLookupState {
  lsIdle,
  lsLookupAddress,
  lsLookupService
};
```

File

ScktComp

Description

This is record ScktComp.TLookupState.

2.3.7 SocktComp.TServerType Enumeration

Pascal

```
TServerType = (
  stNonBlocking,
  stThreadBlocking
);
```

C++

```
enum TServerType {
  stNonBlocking,
  stThreadBlocking
};
```

File

ScktComp

Description

This is record ScktComp.TServerType.

2.3.8 SocktComp.TSocketEvent Enumeration

TSocketEvent identifies the operation that a socket is performing.

Pascal

```
TSocketEvent = (
  seLookup,
  seConnecting,
  seConnect,
  seDisconnect,
  seListen,
  seAccept,
  seWrite,
  seRead
);
```

C++

```
enum TSocketEvent {
  seLookup,
  seConnecting,
  seConnect,
  seDisconnect,
  seListen,
  seAccept,
  seWrite,
  seRead
};
```

File

ScktComp

Description

TSocketEvent is used to identify what a socket is doing when various methods or event handlers are called. It has one of the following values:

Value	Meaning
seLookup	(client sockets only) The Windows socket object is about to locate the server socket. Changing the properties of the client socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will affect the attempted connection.
seConnecting	(client sockets only) The server socket has been located but the connection isn't completed. This is the first opportunity to obtain the actual server port and IP address used for the connection, which may differ from those of the listening socket contacted initially.
seConnect	The socket connection has just been established. This is the point when a socket starts reading or writing over the connection.
seListen	(server sockets only) The Windows socket object has been initialized and is about to open a listening connection. Changing the properties of the server socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will the listening connection.
seAccept	(server sockets only) A client connection request has just been accepted. This is the first opportunity to obtain the port and IP address of the individual client connection.
seWrite	The socket is ready for information to be written.
seRead	The socket is receiving information from a socket on the other end of the connection.

Creating events

2.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAsyncStyles (see page 150)	This is type ScktComp.TAsyncStyles.
TGetSocketEvent (see page 150)	This is type ScktComp.TGetSocketEvent.
TGetThreadEvent (see page 151)	This is type ScktComp.TGetThreadEvent.
TSocketErrorEvent (see page 151)	TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.
TSocketErrorProc (see page 152)	This is type ScktComp.TSocketErrorProc.
TSocketEventEvent (see page 152)	This is type ScktComp.TSocketEventEvent.
TSocketNotifyEvent (see page 152)	The type for event handlers which respond to events during the expected course of forming or using a socket connection.
TThreadNotifyEvent (see page 153)	This is type ScktComp.TThreadNotifyEvent.

2.4.1 ScktComp.TAsyncStyles Type

Pascal

```
TAsyncStyles = set of TAsyncStyle;
```

C++

```
TAsyncStyle TAsyncStyles;
```

File

ScktComp

Description

This is type ScktComp.TAsyncStyles.

2.4.2 ScktComp.TGetSocketEvent Type

Pascal

```
TGetSocketEvent = procedure (Sender: TObject; Socket: TSocket; var ClientSocket:
TServerClientWinSocket) of object;
```

C++

```
(Sender: TObject; Socket: TSocket; var ClientSocket: TServerClientWinSocket) (
TGetSocketEvent)();
```

File

ScktComp

Description

This is type ScktComp.TGetSocketEvent.

2.4.3 SocktComp.TGetThreadEvent Type

Pascal

```
TGetThreadEvent = procedure (Sender: TObject; ClientSocket: TServerClientWinSocket; var
SocketThread: TServerClientThread) of object;
```

C++

```
(Sender: TObject; ClientSocket: TServerClientWinSocket; var SocketThread: TServerClientThread)
( TGetThreadEvent)();
```

File

SocktComp

Description

This is type SocktComp.TGetThreadEvent.

2.4.4 SocktComp.TSocketErrorEvent Type

TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.

Pascal

```
TSocketErrorEvent = procedure (Sender: TObject; Socket: TCustomWinSocket; ErrorEvent:
TErrorEvent; var ErrorCode: Integer) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer) (
TSocketErrorEvent)();
```

File

SocktComp

Description

The Sender parameter is the socket component that encountered the error.

The Socket parameter is the TCustomWinSocket (see page 64) object that receives the error notification.

The ErrorCode parameter is the error code returned by the Windows socket API call. Changing this to 0 within an error handler prevents an exception from being raised.

The ErrorEvent parameter indicates what Socket was attempting to do when the error occurred. It is of type TErrorEvent (see page 147), which can have any of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	A connection request that was already accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.

eeAccept	A problem occurred when trying to accept a client connection request.

Procedural types

Creating events

2.4.5 ScktComp.TSocketErrorProc Type

Pascal

```
TSocketErrorProc = procedure (ErrorCode: Integer);
```

C++

```
(ErrorCode: Integer) ( TSocketErrorProc)();
```

File

ScktComp

Description

This is type ScktComp.TSocketErrorProc.

2.4.6 ScktComp.TSocketEventEvent Type

Pascal

```
TSocketEventEvent = procedure (Sender: TObject; Socket: TCustomWinSocket; SocketEvent:
TSocketEvent) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket; SocketEvent: TSocketEvent) ( TSocketEventEvent)();
```

File

ScktComp

Description

This is type ScktComp.TSocketEventEvent.

2.4.7 ScktComp.TSocketNotifyEvent Type

The type for event handlers which respond to events during the expected course of forming or using a socket connection.

Pascal

```
TSocketNotifyEvent = procedure (Sender: TObject; Socket: TCustomWinSocket) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket) ( TSocketNotifyEvent)();
```

File

SocktComp

Description

The Sender parameter is the socket component or Windows socket object to which the event occurred.

The Socket parameter is the TCustomWinSocket (see page 64) object that represents the endpoint of the connection.

When the event handler belongs to a client Windows socket object, these two parameters are the same. For server Windows socket objects, the Sender parameter represents the listening connection while the Socket parameter represents a client connection.

See Also

TCustomSocket (see page 56)

Procedural types

Creating events

2.4.8 SocktComp.TThreadNotifyEvent Type

Pascal

```
TThreadNotifyEvent = procedure (Sender: TObject; Thread: TServerClientThread) of object;
```

C++

```
(Sender: TObject; Thread: TServerClientThread) ( TThreadNotifyEvent)();
```

File

SocktComp

Description

This is type SocktComp.TThreadNotifyEvent.

2.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CM_DEFERFREE (see page 154)	This is constant ScktComp.CM_DEFERFREE.
CM_LOOKUPCOMPLETE (see page 154)	This is constant ScktComp.CM_LOOKUPCOMPLETE.
CM_SOCKETMESSAGE (see page 154)	This is constant ScktComp.CM_SOCKETMESSAGE.

2.5.1 ScktComp.CM_DEFERFREE Constant

Pascal

```
CM_DEFERFREE = WM_USER + $0002;
```

C++

```
CM_DEFERFREE = WM_USER + $0002;
```

File

ScktComp

Description

This is constant ScktComp.CM_DEFERFREE.

2.5.2 ScktComp.CM_LOOKUPCOMPLETE Constant

Pascal

```
CM_LOOKUPCOMPLETE = WM_USER + $0003;
```

C++

```
CM_LOOKUPCOMPLETE = WM_USER + $0003;
```

File

ScktComp

Description

This is constant ScktComp.CM_LOOKUPCOMPLETE.

2.5.3 ScktComp.CM_SOCKETMESSAGE Constant

Pascal

```
CM_SOCKETMESSAGE = WM_USER + $0001;
```

C++

```
CM_SOCKETMESSAGE = WM_USER + $0001;
```

File

SckttComp

Description

This is constant SckttComp.CM_SOCKETMESSAGE.

3 ScktMain Namespace

This is namespace ScktMain.

Topics

Name	Description
Classes (see page 158)	The following table lists classes in this documentation.
Types (see page 186)	The following table lists types in this documentation.
Variables (see page 187)	The following table lists variables in this documentation.
Constants (see page 188)	The following table lists constants in this documentation.

Classes

	Name	Description
	TSocketForm (see page 158)	This is class ScktMain.TSocketForm.
	TSocketService (see page 182)	This is class ScktMain.TSocketService.

Constants

Name	Description

3.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSocketForm (see page 158)	This is class ScktMain.TSocketForm.
	TSocketService (see page 182)	This is class ScktMain.TSocketService.

3.1.1 TSocketForm Class

Class Hierarchy

Pascal

```
TSocketForm = class(TForm);
```

C++

```
class TSocketForm : public TForm;
```

File

ScktMain

Description

This is class ScktMain.TSocketForm.

3.1.1.1 TSocketForm Members

The following tables list the members exposed by TSocketForm.

Protected Methods

	Name	Description
	AddClient (see page 174)	This is AddClient, a member of class TSocketForm.
	AddIcon (see page 174)	This is AddIcon, a member of class TSocketForm.
	ClearModifications (see page 175)	This is ClearModifications, a member of class TSocketForm.
	ReadSettings (see page 178)	This is ReadSettings, a member of class TSocketForm.
	RemoveClient (see page 179)	This is RemoveClient, a member of class TSocketForm.
	UIInitialize (see page 180)	This is UIInitialize, a member of class TSocketForm.
	WMMIDASIcon (see page 180)	This is WMMIDASIcon, a member of class TSocketForm.
V	WndProc (see page 180)	Provides specific message responses for the form.
	WriteSettings (see page 181)	This is WriteSettings, a member of class TSocketForm.

Public Fields

	Name	Description
	ActionList1 (see page 161)	This is ActionList1, a member of class TSocketForm.
	AllowXML (see page 161)	This is AllowXML, a member of class TSocketForm.

	ApplyAction (see page 162)	This is ApplyAction, a member of class TSocketForm.
	ApplyButton (see page 162)	This is ApplyButton, a member of class TSocketForm.
	ConnectionList (see page 162)	This is ConnectionList, a member of class TSocketForm.
	Connections1 (see page 162)	This is Connections1, a member of class TSocketForm.
	DisconnectAction (see page 163)	This is DisconnectAction, a member of class TSocketForm.
	ExportedObjectOnly1 (see page 163)	This is ExportedObjectOnly1, a member of class TSocketForm.
	GUIDDesc (see page 163)	This is GUIDDesc, a member of class TSocketForm.
	HeaderControl1 (see page 163)	This is HeaderControl1, a member of class TSocketForm.
	InterceptGroup (see page 163)	This is InterceptGroup, a member of class TSocketForm.
	InterceptGUID (see page 164)	This is InterceptGUID, a member of class TSocketForm.
	Label1 (see page 164)	This is Label1, a member of class TSocketForm.
	Label4 (see page 164)	This is Label4, a member of class TSocketForm.
	Label5 (see page 164)	This is Label5, a member of class TSocketForm.
	Label7 (see page 165)	This is Label7, a member of class TSocketForm.
	MainMenu1 (see page 165)	This is MainMenu1, a member of class TSocketForm.
	miAdd (see page 165)	This is miAdd, a member of class TSocketForm.
	miClose (see page 165)	This is miClose, a member of class TSocketForm.
	miDisconnect (see page 165)	This is miDisconnect, a member of class TSocketForm.
	miExit (see page 166)	This is miExit, a member of class TSocketForm.
	miPorts (see page 166)	This is miPorts, a member of class TSocketForm.
	miProperties (see page 166)	This is miProperties, a member of class TSocketForm.
	miRemove (see page 166)	This is miRemove, a member of class TSocketForm.
	miShowHostName (see page 167)	This is miShowHostName, a member of class TSocketForm.
	N1 (see page 167)	This is N1, a member of class TSocketForm.
	N2 (see page 167)	This is N2, a member of class TSocketForm.
	N3 (see page 167)	This is N3, a member of class TSocketForm.
	Pages (see page 167)	This is Pages, a member of class TSocketForm.
	Panel1 (see page 168)	This is Panel1, a member of class TSocketForm.
	PopupMenu (see page 168)	This is PopupMenu, a member of class TSocketForm.
	PortDesc (see page 168)	This is PortDesc, a member of class TSocketForm.
	PortGroup (see page 168)	This is PortGroup, a member of class TSocketForm.
	PortList (see page 169)	This is PortList, a member of class TSocketForm.
	PortNo (see page 169)	This is PortNo, a member of class TSocketForm.
	PortUpDown (see page 169)	This is PortUpDown, a member of class TSocketForm.
	PropPage (see page 169)	This is PropPage, a member of class TSocketForm.
	RegisteredAction (see page 169)	This is RegisteredAction, a member of class TSocketForm.
	RemovePortAction (see page 170)	This is RemovePortAction, a member of class TSocketForm.
	ShowHostAction (see page 170)	This is ShowHostAction, a member of class TSocketForm.
	StatPage (see page 170)	This is StatPage, a member of class TSocketForm.
	ThreadDesc (see page 170)	This is ThreadDesc, a member of class TSocketForm.
	ThreadGroup (see page 171)	This is ThreadGroup, a member of class TSocketForm.
	ThreadSize (see page 171)	This is ThreadSize, a member of class TSocketForm.
	ThreadUpDown (see page 171)	This is ThreadUpDown, a member of class TSocketForm.
	Timeout (see page 171)	This is Timeout, a member of class TSocketForm.
	TimeoutDesc (see page 171)	This is TimeoutDesc, a member of class TSocketForm.
	TimeoutGroup (see page 172)	This is TimeoutGroup, a member of class TSocketForm.
	TimeoutUpDown (see page 172)	This is TimeoutUpDown, a member of class TSocketForm.
	UpdateTimer (see page 172)	This is UpdateTimer, a member of class TSocketForm.
	UserStatus (see page 172)	This is UserStatus, a member of class TSocketForm.
	XMLPacket1 (see page 173)	This is XMLPacket1, a member of class TSocketForm.

Public Methods

	Name	Description
	AllowXMLExecute (see page 174)	This is AllowXMLExecute, a member of class TSocketForm.

	ApplyActionExecute (see page 174)	This is ApplyActionExecute, a member of class TSocketForm.
	ApplyActionUpdate (see page 174)	This is ApplyActionUpdate, a member of class TSocketForm.
	ConnectionListColumnClick (see page 175)	This is ConnectionListColumnClick, a member of class TSocketForm.
	ConnectionListCompare (see page 175)	This is ConnectionListCompare, a member of class TSocketForm.
	DisconnectActionUpdate (see page 175)	This is DisconnectActionUpdate, a member of class TSocketForm.
	FormCloseQuery (see page 176)	This is FormCloseQuery, a member of class TSocketForm.
	FormCreate (see page 176)	This is FormCreate, a member of class TSocketForm.
	FormDestroy (see page 176)	This is FormDestroy, a member of class TSocketForm.
	FormShow (see page 176)	This is FormShow, a member of class TSocketForm.
	Initialize (see page 176)	This is Initialize, a member of class TSocketForm.
	IntegerExit (see page 177)	This is IntegerExit, a member of class TSocketForm.
	miAddClick (see page 177)	This is miAddClick, a member of class TSocketForm.
	miCloseClick (see page 177)	This is miCloseClick, a member of class TSocketForm.
	miDisconnectClick (see page 177)	This is miDisconnectClick, a member of class TSocketForm.
	miExitClick (see page 178)	This is miExitClick, a member of class TSocketForm.
	miPropertiesClick (see page 178)	This is miPropertiesClick, a member of class TSocketForm.
	PortListClick (see page 178)	This is PortListClick, a member of class TSocketForm.
	RegisteredActionExecute (see page 178)	This is RegisteredActionExecute, a member of class TSocketForm.
	RemovePortActionExecute (see page 179)	This is RemovePortActionExecute, a member of class TSocketForm.
	RemovePortActionUpdate (see page 179)	This is RemovePortActionUpdate, a member of class TSocketForm.
	ShowHostActionExecute (see page 179)	This is ShowHostActionExecute, a member of class TSocketForm.
	UpdateTimerTimer (see page 180)	This is UpdateTimerTimer, a member of class TSocketForm.
	UpDownClick (see page 180)	This is UpDownClick, a member of class TSocketForm.

Public Properties

	Name	Description
	ItemIndex (see page 181)	This is ItemIndex, a member of class TSocketForm.
R	SelectedSocket (see page 181)	This is SelectedSocket, a member of class TSocketForm.

3.1.1.2 TSocketForm Fields

The fields of the TSocketForm class are listed here.

Public Fields

	Name	Description
	ActionList1 (see page 161)	This is ActionList1, a member of class TSocketForm.
	AllowXML (see page 161)	This is AllowXML, a member of class TSocketForm.
	ApplyAction (see page 162)	This is ApplyAction, a member of class TSocketForm.
	ApplyButton (see page 162)	This is ApplyButton, a member of class TSocketForm.
	ConnectionList (see page 162)	This is ConnectionList, a member of class TSocketForm.
	Connections1 (see page 162)	This is Connections1, a member of class TSocketForm.
	DisconnectAction (see page 163)	This is DisconnectAction, a member of class TSocketForm.
	ExportedObjectOnly1 (see page 163)	This is ExportedObjectOnly1, a member of class TSocketForm.
	GUIDDesc (see page 163)	This is GUIDDesc, a member of class TSocketForm.
	HeaderControl1 (see page 163)	This is HeaderControl1, a member of class TSocketForm.
	InterceptGroup (see page 163)	This is InterceptGroup, a member of class TSocketForm.
	InterceptGUID (see page 164)	This is InterceptGUID, a member of class TSocketForm.
	Label1 (see page 164)	This is Label1, a member of class TSocketForm.
	Label4 (see page 164)	This is Label4, a member of class TSocketForm.
	Label5 (see page 164)	This is Label5, a member of class TSocketForm.
	Label7 (see page 165)	This is Label7, a member of class TSocketForm.
	MainMenu1 (see page 165)	This is MainMenu1, a member of class TSocketForm.
	miAdd (see page 165)	This is miAdd, a member of class TSocketForm.

	miClose (see page 165)	This is miClose, a member of class TSocketForm.
	miDisconnect (see page 165)	This is miDisconnect, a member of class TSocketForm.
	miExit (see page 166)	This is miExit, a member of class TSocketForm.
	miPorts (see page 166)	This is miPorts, a member of class TSocketForm.
	miProperties (see page 166)	This is miProperties, a member of class TSocketForm.
	miRemove (see page 166)	This is miRemove, a member of class TSocketForm.
	miShowHostName (see page 167)	This is miShowHostName, a member of class TSocketForm.
	N1 (see page 167)	This is N1, a member of class TSocketForm.
	N2 (see page 167)	This is N2, a member of class TSocketForm.
	N3 (see page 167)	This is N3, a member of class TSocketForm.
	Pages (see page 167)	This is Pages, a member of class TSocketForm.
	Panel1 (see page 168)	This is Panel1, a member of class TSocketForm.
	PopupMenu (see page 168)	This is PopupMenu, a member of class TSocketForm.
	PortDesc (see page 168)	This is PortDesc, a member of class TSocketForm.
	PortGroup (see page 168)	This is PortGroup, a member of class TSocketForm.
	PortList (see page 169)	This is PortList, a member of class TSocketForm.
	PortNo (see page 169)	This is PortNo, a member of class TSocketForm.
	PortUpDown (see page 169)	This is PortUpDown, a member of class TSocketForm.
	PropPage (see page 169)	This is PropPage, a member of class TSocketForm.
	RegisteredAction (see page 169)	This is RegisteredAction, a member of class TSocketForm.
	RemovePortAction (see page 170)	This is RemovePortAction, a member of class TSocketForm.
	ShowHostAction (see page 170)	This is ShowHostAction, a member of class TSocketForm.
	StatPage (see page 170)	This is StatPage, a member of class TSocketForm.
	ThreadDesc (see page 170)	This is ThreadDesc, a member of class TSocketForm.
	ThreadGroup (see page 171)	This is ThreadGroup, a member of class TSocketForm.
	ThreadSize (see page 171)	This is ThreadSize, a member of class TSocketForm.
	ThreadUpDown (see page 171)	This is ThreadUpDown, a member of class TSocketForm.
	Timeout (see page 171)	This is Timeout, a member of class TSocketForm.
	TimeoutDesc (see page 171)	This is TimeoutDesc, a member of class TSocketForm.
	TimeoutGroup (see page 172)	This is TimeoutGroup, a member of class TSocketForm.
	TimeoutUpDown (see page 172)	This is TimeoutUpDown, a member of class TSocketForm.
	UpdateTimer (see page 172)	This is UpdateTimer, a member of class TSocketForm.
	UserStatus (see page 172)	This is UserStatus, a member of class TSocketForm.
	XMLPacket1 (see page 173)	This is XMLPacket1, a member of class TSocketForm.

3.1.1.2.1 TSocketForm.ActionList1 Field

Pascal

```
ActionList1: TActionList;
```

C++

```
TActionList ActionList1;
```

Description

This is ActionList1, a member of class TSocketForm.

3.1.1.2.2 TSocketForm.AllowXML Field

Pascal

```
AllowXML: TAction;
```

C++

```
TAction AllowXML;
```

Description

This is AllowXML, a member of class TSocketForm.

3.1.1.2.3 TSocketForm.ApplyAction Field

Pascal

```
ApplyAction: TAction;
```

C++

```
TAction ApplyAction;
```

Description

This is ApplyAction, a member of class TSocketForm.

3.1.1.2.4 TSocketForm.ApplyButton Field

Pascal

```
ApplyButton: TButton;
```

C++

```
TButton ApplyButton;
```

Description

This is ApplyButton, a member of class TSocketForm.

3.1.1.2.5 TSocketForm.ConnectionList Field

Pascal

```
ConnectionList: TListView;
```

C++

```
TListView ConnectionList;
```

Description

This is ConnectionList, a member of class TSocketForm.

3.1.1.2.6 TSocketForm.Connections1 Field

Pascal

```
Connections1: TMenuItem;
```

C++

```
TMenuItem Connections1;
```

Description

This is Connections1, a member of class TSocketForm.

3.1.1.2.7 TSocketForm.DisconnectAction Field

Pascal

```
DisconnectAction: TAction;
```

C++

```
TAction DisconnectAction;
```

Description

This is DisconnectAction, a member of class TSocketForm.

3.1.1.2.8 TSocketForm.ExportedObjectOnly1 Field

Pascal

```
ExportedObjectOnly1: TMenuItem;
```

C++

```
TMenuItem ExportedObjectOnly1;
```

Description

This is ExportedObjectOnly1, a member of class TSocketForm.

3.1.1.2.9 TSocketForm.GUIDDesc Field

Pascal

```
GUIDDesc: TLabel;
```

C++

```
TLabel GUIDDesc;
```

Description

This is GUIDDesc, a member of class TSocketForm.

3.1.1.2.10 TSocketForm.HeaderControl1 Field

Pascal

```
HeaderControl1: THeaderControl;
```

C++

```
THeaderControl HeaderControl1;
```

Description

This is HeaderControl1, a member of class TSocketForm.

3.1.1.2.11 TSocketForm.InterceptGroup Field

Pascal

```
InterceptGroup: TGroupBox;
```

C++

```
TGroupBox InterceptGroup;
```

Description

This is InterceptGroup, a member of class TSocketForm.

3.1.1.2.12 TSocketForm.InterceptGUID Field

Pascal

```
InterceptGUID: TEdit;
```

C++

```
TEdit InterceptGUID;
```

Description

This is InterceptGUID, a member of class TSocketForm.

3.1.1.2.13 TSocketForm.Label1 Field

Pascal

```
Label1: TLabel;
```

C++

```
TLabel Label1;
```

Description

This is Label1, a member of class TSocketForm.

3.1.1.2.14 TSocketForm.Label4 Field

Pascal

```
Label4: TLabel;
```

C++

```
TLabel Label4;
```

Description

This is Label4, a member of class TSocketForm.

3.1.1.2.15 TSocketForm.Label5 Field

Pascal

```
Label5: TLabel;
```

C++

```
TLabel Label5;
```

Description

This is Label5, a member of class TSocketForm.

3.1.1.2.16 TSocketForm.Label7 Field

Pascal

```
Label7: TLabel;
```

C++

```
TLabel Label7;
```

Description

This is Label7, a member of class TSocketForm.

3.1.1.2.17 TSocketForm.MainMenu1 Field

Pascal

```
MainMenu1: TMainMenu;
```

C++

```
TMainMenu MainMenu1;
```

Description

This is MainMenu1, a member of class TSocketForm.

3.1.1.2.18 TSocketForm.miAdd Field

Pascal

```
miAdd: TMenuItem;
```

C++

```
TMenuItem miAdd;
```

Description

This is miAdd, a member of class TSocketForm.

3.1.1.2.19 TSocketForm.miClose Field

Pascal

```
miClose: TMenuItem;
```

C++

```
TMenuItem miClose;
```

Description

This is miClose, a member of class TSocketForm.

3.1.1.2.20 TSocketForm.miDisconnect Field

Pascal

```
miDisconnect: TMenuItem;
```

C++

```
TMenuItem miDisconnect;
```

Description

This is miDisconnect, a member of class TSocketForm.

3.1.1.2.21 TSocketForm.miExit Field

Pascal

```
miExit: TMenuItem;
```

C++

```
TMenuItem miExit;
```

Description

This is miExit, a member of class TSocketForm.

3.1.1.2.22 TSocketForm.miPorts Field

Pascal

```
miPorts: TMenuItem;
```

C++

```
TMenuItem miPorts;
```

Description

This is miPorts, a member of class TSocketForm.

3.1.1.2.23 TSocketForm.miProperties Field

Pascal

```
miProperties: TMenuItem;
```

C++

```
TMenuItem miProperties;
```

Description

This is miProperties, a member of class TSocketForm.

3.1.1.2.24 TSocketForm.miRemove Field

Pascal

```
miRemove: TMenuItem;
```

C++

```
TMenuItem miRemove;
```

Description

This is miRemove, a member of class TSocketForm.

3.1.1.2.25 TSocketForm.miShowHostName Field

Pascal

```
miShowHostName: TMenuItem;
```

C++

```
TMenuItem miShowHostName;
```

Description

This is miShowHostName, a member of class TSocketForm.

3.1.1.2.26 TSocketForm.N1 Field

Pascal

```
N1: TMenuItem;
```

C++

```
TMenuItem N1;
```

Description

This is N1, a member of class TSocketForm.

3.1.1.2.27 TSocketForm.N2 Field

Pascal

```
N2: TMenuItem;
```

C++

```
TMenuItem N2;
```

Description

This is N2, a member of class TSocketForm.

3.1.1.2.28 TSocketForm.N3 Field

Pascal

```
N3: TMenuItem;
```

C++

```
TMenuItem N3;
```

Description

This is N3, a member of class TSocketForm.

3.1.1.2.29 TSocketForm.Pages Field

Pascal

```
Pages: TPageControl;
```

C++

```
TPageControl Pages;
```

Description

This is Pages, a member of class TSocketForm.

3.1.1.2.30 TSocketForm.Panel1 Field

Pascal

```
Panel1: TPanel;
```

C++

```
TPanel Panel1;
```

Description

This is Panel1, a member of class TSocketForm.

3.1.1.2.31 TSocketForm.PopupMenu Field

Pascal

```
PopupMenu: TPopupMenu;
```

C++

```
TPopupMenu PopupMenu;
```

Description

This is PopupMenu, a member of class TSocketForm.

3.1.1.2.32 TSocketForm.PortDesc Field

Pascal

```
PortDesc: TLabel;
```

C++

```
TLabel PortDesc;
```

Description

This is PortDesc, a member of class TSocketForm.

3.1.1.2.33 TSocketForm.PortGroup Field

Pascal

```
PortGroup: TGroupBox;
```

C++

```
TGroupBox PortGroup;
```

Description

This is PortGroup, a member of class TSocketForm.

3.1.1.2.34 TSocketForm.PortList Field

Pascal

```
PortList: TListBox;
```

C++

```
TListBox PortList;
```

Description

This is PortList, a member of class TSocketForm.

3.1.1.2.35 TSocketForm.PortNo Field

Pascal

```
PortNo: TEdit;
```

C++

```
TEdit PortNo;
```

Description

This is PortNo, a member of class TSocketForm.

3.1.1.2.36 TSocketForm.PortUpDown Field

Pascal

```
PortUpDown: TUpDown;
```

C++

```
TUpDown PortUpDown;
```

Description

This is PortUpDown, a member of class TSocketForm.

3.1.1.2.37 TSocketForm.PropPage Field

Pascal

```
PropPage: TTabSheet;
```

C++

```
TTabSheet PropPage;
```

Description

This is PropPage, a member of class TSocketForm.

3.1.1.2.38 TSocketForm.RegisteredAction Field

Pascal

```
RegisteredAction: TAction;
```

C++

```
TAction RegisteredAction;
```

Description

This is RegisteredAction, a member of class TSocketForm.

3.1.1.2.39 TSocketForm.RemovePortAction Field

Pascal

```
RemovePortAction: TAction;
```

C++

```
TAction RemovePortAction;
```

Description

This is RemovePortAction, a member of class TSocketForm.

3.1.1.2.40 TSocketForm.ShowHostAction Field

Pascal

```
ShowHostAction: TAction;
```

C++

```
TAction ShowHostAction;
```

Description

This is ShowHostAction, a member of class TSocketForm.

3.1.1.2.41 TSocketForm.StatPage Field

Pascal

```
StatPage: TTabSheet;
```

C++

```
TTabSheet StatPage;
```

Description

This is StatPage, a member of class TSocketForm.

3.1.1.2.42 TSocketForm.ThreadDesc Field

Pascal

```
ThreadDesc: TLabel;
```

C++

```
TLabel ThreadDesc;
```

Description

This is ThreadDesc, a member of class TSocketForm.

3.1.1.2.43 TSocketForm.ThreadGroup Field

Pascal

```
ThreadGroup: TGroupBox;
```

C++

```
TGroupBox ThreadGroup;
```

Description

This is ThreadGroup, a member of class TSocketForm.

3.1.1.2.44 TSocketForm.ThreadSize Field

Pascal

```
ThreadSize: TEdit;
```

C++

```
TEdit ThreadSize;
```

Description

This is ThreadSize, a member of class TSocketForm.

3.1.1.2.45 TSocketForm.ThreadUpDown Field

Pascal

```
ThreadUpDown: TUpDown;
```

C++

```
TUpDown ThreadUpDown;
```

Description

This is ThreadUpDown, a member of class TSocketForm.

3.1.1.2.46 TSocketForm.Timeout Field

Pascal

```
Timeout: TEdit;
```

C++

```
TEdit Timeout;
```

Description

This is Timeout, a member of class TSocketForm.

3.1.1.2.47 TSocketForm.TimeoutDesc Field

Pascal

```
TimeoutDesc: TLabel;
```

C++

```
TLabel TimeoutDesc;
```

Description

This is TimeoutDesc, a member of class TSocketForm.

3.1.1.2.48 TSocketForm.TimeoutGroup Field

Pascal

```
TimeoutGroup: TGroupBox;
```

C++

```
TGroupBox TimeoutGroup;
```

Description

This is TimeoutGroup, a member of class TSocketForm.

3.1.1.2.49 TSocketForm.TimeoutUpDown Field

Pascal

```
TimeoutUpDown: TUpDown;
```

C++

```
TUpDown TimeoutUpDown;
```

Description

This is TimeoutUpDown, a member of class TSocketForm.

3.1.1.2.50 TSocketForm.UpdateTimer Field

Pascal

```
UpdateTimer: TTimer;
```

C++

```
TTimer UpdateTimer;
```

Description

This is UpdateTimer, a member of class TSocketForm.

3.1.1.2.51 TSocketForm.UserStatus Field

Pascal

```
UserStatus: TStatusBar;
```

C++

```
TStatusBar UserStatus;
```

Description

This is UserStatus, a member of class TSocketForm.

3.1.1.2.52 TSocketForm.XMLPacket1 Field

Pascal

```
XMLPacket1: TMenuItem;
```

C++

```
TMenuItem XMLPacket1;
```

Description

This is XMLPacket1, a member of class TSocketForm.

3.1.1.3 TSocketForm Methods

The methods of the TSocketForm class are listed here.

Protected Methods

	Name	Description
	AddClient (see page 174)	This is AddClient, a member of class TSocketForm.
	AddIcon (see page 174)	This is AddIcon, a member of class TSocketForm.
	ClearModifications (see page 175)	This is ClearModifications, a member of class TSocketForm.
	ReadSettings (see page 178)	This is ReadSettings, a member of class TSocketForm.
	RemoveClient (see page 179)	This is RemoveClient, a member of class TSocketForm.
	UIInitialize (see page 180)	This is UIInitialize, a member of class TSocketForm.
	WMMIDASIcon (see page 180)	This is WMMIDASIcon, a member of class TSocketForm.
	WndProc (see page 180)	Provides specific message responses for the form.
	WriteSettings (see page 181)	This is WriteSettings, a member of class TSocketForm.

Public Methods

	Name	Description
	AllowXMLExecute (see page 174)	This is AllowXMLExecute, a member of class TSocketForm.
	ApplyActionExecute (see page 174)	This is ApplyActionExecute, a member of class TSocketForm.
	ApplyActionUpdate (see page 174)	This is ApplyActionUpdate, a member of class TSocketForm.
	ConnectionListColumnClick (see page 175)	This is ConnectionListColumnClick, a member of class TSocketForm.
	ConnectionListCompare (see page 175)	This is ConnectionListCompare, a member of class TSocketForm.
	DisconnectActionUpdate (see page 175)	This is DisconnectActionUpdate, a member of class TSocketForm.
	FormCloseQuery (see page 176)	This is FormCloseQuery, a member of class TSocketForm.
	FormCreate (see page 176)	This is FormCreate, a member of class TSocketForm.
	FormDestroy (see page 176)	This is FormDestroy, a member of class TSocketForm.
	FormShow (see page 176)	This is FormShow, a member of class TSocketForm.
	Initialize (see page 176)	This is Initialize, a member of class TSocketForm.
	IntegerExit (see page 177)	This is IntegerExit, a member of class TSocketForm.
	miAddClick (see page 177)	This is miAddClick, a member of class TSocketForm.
	miCloseClick (see page 177)	This is miCloseClick, a member of class TSocketForm.
	miDisconnectClick (see page 177)	This is miDisconnectClick, a member of class TSocketForm.
	miExitClick (see page 178)	This is miExitClick, a member of class TSocketForm.
	miPropertiesClick (see page 178)	This is miPropertiesClick, a member of class TSocketForm.
	PortListClick (see page 178)	This is PortListClick, a member of class TSocketForm.
	RegisteredActionExecute (see page 178)	This is RegisteredActionExecute, a member of class TSocketForm.
	RemovePortActionExecute (see page 179)	This is RemovePortActionExecute, a member of class TSocketForm.
	RemovePortActionUpdate (see page 179)	This is RemovePortActionUpdate, a member of class TSocketForm.
	ShowHostActionExecute (see page 179)	This is ShowHostActionExecute, a member of class TSocketForm.
	UpdateTimerTimer (see page 180)	This is UpdateTimerTimer, a member of class TSocketForm.

	UpDownClick (see page 180)	This is UpDownClick, a member of class TSocketForm.

3.1.1.3.1 TSocketForm.AddClient Method

Pascal

```
procedure AddClient(Thread: TServerClientThread);
```

C++

```
__fastcall AddClient(TServerClientThread Thread);
```

Description

This is AddClient, a member of class TSocketForm.

3.1.1.3.2 TSocketForm.AddIcon Method

Pascal

```
procedure AddIcon;
```

C++

```
__fastcall AddIcon();
```

Description

This is AddIcon, a member of class TSocketForm.

3.1.1.3.3 TSocketForm.AllowXMLExecute Method

Pascal

```
procedure AllowXMLExecute(Sender: TObject);
```

C++

```
__fastcall AllowXMLExecute(TObject * Sender);
```

Description

This is AllowXMLExecute, a member of class TSocketForm.

3.1.1.3.4 TSocketForm.ApplyActionExecute Method

Pascal

```
procedure ApplyActionExecute(Sender: TObject);
```

C++

```
__fastcall ApplyActionExecute(TObject * Sender);
```

Description

This is ApplyActionExecute, a member of class TSocketForm.

3.1.1.3.5 TSocketForm.ApplyActionUpdate Method

Pascal

```
procedure ApplyActionUpdate(Sender: TObject);
```

C++

```
__fastcall ApplyActionUpdate(TObject * Sender);
```

Description

This is ApplyActionUpdate, a member of class TSocketForm.

3.1.1.3.6 TSocketForm.ClearModifications Method

Pascal

```
procedure ClearModifications;
```

C++

```
__fastcall ClearModifications();
```

Description

This is ClearModifications, a member of class TSocketForm.

3.1.1.3.7 TSocketForm.ConnectionListColumnClick Method

Pascal

```
procedure ConnectionListColumnClick(Sender: TObject; Column: TListColumn);
```

C++

```
__fastcall ConnectionListColumnClick(TObject * Sender, TListColumn Column);
```

Description

This is ConnectionListColumnClick, a member of class TSocketForm.

3.1.1.3.8 TSocketForm.ConnectionListCompare Method

Pascal

```
procedure ConnectionListCompare(Sender: TObject; Item1: TListItem; Item2: TListItem; Data:
Integer; var Compare: Integer);
```

C++

```
__fastcall ConnectionListCompare(TObject * Sender, TListItem Item1, TListItem Item2, int Data,
int Compare);
```

Description

This is ConnectionListCompare, a member of class TSocketForm.

3.1.1.3.9 TSocketForm.DisconnectActionUpdate Method

Pascal

```
procedure DisconnectActionUpdate(Sender: TObject);
```

C++

```
__fastcall DisconnectActionUpdate(TObject * Sender);
```

Description

This is DisconnectActionUpdate, a member of class TSocketForm.

3.1.1.3.10 TSocketForm.FormCloseQuery Method

Pascal

```
procedure FormCloseQuery(Sender: TObject; var CanClose: Boolean);
```

C++

```
__fastcall FormCloseQuery(TObject * Sender, Boolean CanClose);
```

Description

This is FormCloseQuery, a member of class TSocketForm.

3.1.1.3.11 TSocketForm.FormCreate Method

Pascal

```
procedure FormCreate(Sender: TObject);
```

C++

```
__fastcall FormCreate(TObject * Sender);
```

Description

This is FormCreate, a member of class TSocketForm.

3.1.1.3.12 TSocketForm.FormDestroy Method

Pascal

```
procedure FormDestroy(Sender: TObject);
```

C++

```
__fastcall FormDestroy(TObject * Sender);
```

Description

This is FormDestroy, a member of class TSocketForm.

3.1.1.3.13 TSocketForm.FormShow Method

Pascal

```
procedure FormShow(Sender: TObject);
```

C++

```
__fastcall FormShow(TObject * Sender);
```

Description

This is FormShow, a member of class TSocketForm.

3.1.1.3.14 TSocketForm.Initialize Method

Pascal

```
procedure Initialize(FromService: Boolean);
```

C++

```
__fastcall Initialize(Boolean FromService);
```

Description

This is Initialize, a member of class TSocketForm.

3.1.1.3.15 TSocketForm.IntegerExit Method

Pascal

```
procedure IntegerExit(Sender: TObject);
```

C++

```
__fastcall IntegerExit(TObject * Sender);
```

Description

This is IntegerExit, a member of class TSocketForm.

3.1.1.3.16 TSocketForm.miAddClick Method

Pascal

```
procedure miAddClick(Sender: TObject);
```

C++

```
__fastcall miAddClick(TObject * Sender);
```

Description

This is miAddClick, a member of class TSocketForm.

3.1.1.3.17 TSocketForm.miCloseClick Method

Pascal

```
procedure miCloseClick(Sender: TObject);
```

C++

```
__fastcall miCloseClick(TObject * Sender);
```

Description

This is miCloseClick, a member of class TSocketForm.

3.1.1.3.18 TSocketForm.miDisconnectClick Method

Pascal

```
procedure miDisconnectClick(Sender: TObject);
```

C++

```
__fastcall miDisconnectClick(TObject * Sender);
```

Description

This is miDisconnectClick, a member of class TSocketForm.

3.1.1.3.19 TSocketForm.miExitClick Method

Pascal

```
procedure miExitClick(Sender: TObject);
```

C++

```
__fastcall miExitClick(TObject * Sender);
```

Description

This is miExitClick, a member of class TSocketForm.

3.1.1.3.20 TSocketForm.miPropertiesClick Method

Pascal

```
procedure miPropertiesClick(Sender: TObject);
```

C++

```
__fastcall miPropertiesClick(TObject * Sender);
```

Description

This is miPropertiesClick, a member of class TSocketForm.

3.1.1.3.21 TSocketForm.PortListClick Method

Pascal

```
procedure PortListClick(Sender: TObject);
```

C++

```
__fastcall PortListClick(TObject * Sender);
```

Description

This is PortListClick, a member of class TSocketForm.

3.1.1.3.22 TSocketForm.ReadSettings Method

Pascal

```
procedure ReadSettings;
```

C++

```
__fastcall ReadSettings();
```

Description

This is ReadSettings, a member of class TSocketForm.

3.1.1.3.23 TSocketForm.RegisteredActionExecute Method

Pascal

```
procedure RegisteredActionExecute(Sender: TObject);
```

C++

```
__fastcall RegisteredActionExecute(TObject * Sender);
```

Description

This is RegisteredActionExecute, a member of class TSocketForm.

3.1.1.3.24 TSocketForm.RemoveClient Method

Pascal

```
procedure RemoveClient(Thread: TServerClientThread);
```

C++

```
__fastcall RemoveClient(TServerClientThread Thread);
```

Description

This is RemoveClient, a member of class TSocketForm.

3.1.1.3.25 TSocketForm.RemovePortActionExecute Method

Pascal

```
procedure RemovePortActionExecute(Sender: TObject);
```

C++

```
__fastcall RemovePortActionExecute(TObject * Sender);
```

Description

This is RemovePortActionExecute, a member of class TSocketForm.

3.1.1.3.26 TSocketForm.RemovePortActionUpdate Method

Pascal

```
procedure RemovePortActionUpdate(Sender: TObject);
```

C++

```
__fastcall RemovePortActionUpdate(TObject * Sender);
```

Description

This is RemovePortActionUpdate, a member of class TSocketForm.

3.1.1.3.27 TSocketForm.ShowHostActionExecute Method

Pascal

```
procedure ShowHostActionExecute(Sender: TObject);
```

C++

```
__fastcall ShowHostActionExecute(TObject * Sender);
```

Description

This is ShowHostActionExecute, a member of class TSocketForm.

3.1.1.3.28 TSocketForm.UIInitialize Method

Pascal

```
procedure UIInitialize(var Message: TMessage); message UI_INITIALIZE;
```

C++

```
__fastcall UIInitialize(TMessage Message);
```

Description

This is UIInitialize, a member of class TSocketForm.

3.1.1.3.29 TSocketForm.UpdateTimerTimer Method

Pascal

```
procedure UpdateTimerTimer(Sender: TObject);
```

C++

```
__fastcall UpdateTimerTimer(TObject * Sender);
```

Description

This is UpdateTimerTimer, a member of class TSocketForm.

3.1.1.3.30 TSocketForm.UpDownClick Method

Pascal

```
procedure UpDownClick(Sender: TObject; Button: TUDBtnType);
```

C++

```
__fastcall UpDownClick(TObject * Sender, TUDBtnType Button);
```

Description

This is UpDownClick, a member of class TSocketForm.

3.1.1.3.31 TSocketForm.WMMIDASIcon Method

Pascal

```
procedure WMMIDASIcon(var Message: TMessage); message WM_MIDASICON;
```

C++

```
__fastcall WMMIDASIcon(TMessage Message);
```

Description

This is WMMIDASIcon, a member of class TSocketForm.

3.1.1.3.32 TSocketForm.WndProc Method

Provides specific message responses for the form.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method that receives messages for a form. After calling the inherited method, WndProc performs some window activation, focus, and position message handling necessary to keep in sync with Windows. Override WndProc to change how the form responds to Windows messages.

See Also

WndProc

3.1.1.3.33 TSocketForm.WriteSettings Method

Pascal

```
procedure WriteSettings;
```

C++

```
__fastcall WriteSettings();
```

Description

This is WriteSettings, a member of class TSocketForm.

3.1.1.4 TSocketForm Properties

The properties of the TSocketForm class are listed here.

Public Properties

	Name	Description
	ItemIndex (see page 181)	This is ItemIndex, a member of class TSocketForm.
R	SelectedSocket (see page 181)	This is SelectedSocket, a member of class TSocketForm.

3.1.1.4.1 TSocketForm.ItemIndex Property

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

This is ItemIndex, a member of class TSocketForm.

3.1.1.4.2 TSocketForm.SelectedSocket Property

Pascal

```
property SelectedSocket: TServerSocket;
```

C++

```
__property TServerSocket SelectedSocket;
```

Description

This is SelectedSocket, a member of class TSocketForm.

3.1.2 TSocketService Class

Class Hierarchy

Pascal

```
TSocketService = class(TService);
```

C++

```
class TSocketService : public TService;
```

File

ScktMain

Description

This is class ScktMain.TSocketService.

3.1.2.1 TSocketService Members

The following tables list the members exposed by TSocketService.

Protected Methods

	Name	Description
	Controller (see page 3074)	This is Controller, a member of class TService.
	DoContinue (see page 3074)	This is DoContinue, a member of class TService.
	DoCustomControl (see page 3074)	This is DoCustomControl, a member of class TService.
	DoInterrogate (see page 3074)	This is DoInterrogate, a member of class TService.
	DoPause (see page 3075)	This is DoPause, a member of class TService.
	DoShutdown (see page 3075)	This is DoShutdown, a member of class TService.
	DoStart (see page 3075)	This is DoStart, a member of class TService.
	DoStop (see page 3075)	This is DoStop, a member of class TService.
	Main (see page 3077)	This is Main, a member of class TService.
	Start (see page 184)	This is Start, a member of class TSocketService.
	Stop (see page 185)	This is Stop, a member of class TSocketService.

Public Methods

	Name	Description
	CreateNew (see page 183)	Instantiates and initializes a TService object.
	Destroy (see page 3073)	Disposes of a TService (see page 3071) instance.
	GetServiceController (see page 184)	Returns the service's registered handler function.
	LogMessage (see page 3076)	Sends an error message to the event log.
	ReportStatus (see page 3077)	Updates the Service Control Manager's status information for the calling service.

Public Properties

	Name	Description
	ErrCode (see page 3079)	Contains the service specific error code returned on starting or stopping the service.

	Param (see page 3081)	Lists the parameters to the service.
	ParamCount (see page 3081)	Indicates the number of startup parameters for the service.
	ServiceThread (see page 3082)	Identifies the dedicated thread for the service.
	Status (see page 3083)	Indicates the current state of the service.
	Terminated (see page 3084)	Indicates whether the service thread has terminated.
	Win32ErrCode (see page 3085)	Indicates the Win32 error code reported by the service if a service specific code is not defined.

Published Events

	Name	Description
	AfterInstall (see page 3085)	Occurs immediately after the service is registered with the Windows Service Control manager.
	AfterUninstall (see page 3086)	Occurs immediately after the service is removed from the Service Control manager's database.
	BeforeInstall (see page 3086)	Occurs before the service is first registered with the Windows Service Control manager.
	BeforeUninstall (see page 3087)	Occurs immediately before the service is removed from the Service Control manager's database.
	OnContinue (see page 3087)	Occurs when the Service Control manager resumes the service after it has been paused.
	OnExecute (see page 3088)	Occurs when the thread associated with the service starts up.
	OnPause (see page 3088)	Occurs when the Service Control manager pauses the service temporarily.
	OnShutdown (see page 3088)	Occurs when the system running the service application is about to shut down.
	OnStart (see page 3089)	OnStartup occurs when the service first starts up, before the OnExecute (see page 3088) event.
	OnStop (see page 3089)	Occurs when the Service Control manager stops the service.

Published Properties

	Name	Description
	AllowPause (see page 3078)	Indicates whether clients are allowed to pause the service.
	AllowStop (see page 3078)	Indicates whether clients are allowed to stop the service.
	Dependencies (see page 3078)	Lists the services or load ordering groups on which the service depends.
	DisplayName (see page 3079)	Identifies the service in the Windows Service Control Manager.
	ErrorSeverity (see page 3080)	Indicates the severity of service startup failure.
	Interactive (see page 3080)	Indicates whether the service is interactive with the Windows desktop.
	LoadGroup (see page 3080)	Names of the load ordering group that includes the service.
	Password (see page 3081)	Specifies the password, optionally used depending upon the ServiceStartName (see page 3082), for accessing the service.
	ServiceStartName (see page 3082)	ServiceStartName is the name used in the Service Control Manager Startup dialog to start the service.
	ServiceType (see page 3083)	Identifies the type of the service as Win32, device driver, or file system driver.
	StartType (see page 3083)	Indicates when or how the service starts.
	TagID (see page 3084)	Specifies a unique tag for the service within its LoadGroup (see page 3080).
	WaitHint (see page 3084)	Specifies the estimated time, in milliseconds, between a call from the Windows Service Control Manager and the service reporting its status.

3.1.2.2 TSocketService.CreateNew Constructor

Instantiates and initializes a TService object.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TSocketService(TComponent * AOwner, int Dummy = 0);
```

Description

Call CreateNew to instantiate a service object at runtime. Services added at design time are created automatically. The AOwner parameter specifies the TServiceApplication object that is responsible for ultimately freeing the service. The Dummy parameter is not used. Use CreateNew rather than the Create constructor to instantiate a new service object at runtime. CreateNew does not attempt to stream in an associated DFM file that indicates any components added to the service at design time.

See Also

Owner

Create (see page 3064)

TServiceApplication (see page 3089)

3.1.2.3 TSocketService Methods

The methods of the TSocketService class are listed here.

Protected Methods

	Name	Description
	Start (see page 184)	This is Start, a member of class TSocketService.
	Stop (see page 185)	This is Stop, a member of class TSocketService.

Public Methods

	Name	Description
	GetServiceController (see page 184)	Returns the service's registered handler function.

3.1.2.3.1 TSocketService.GetServiceController Method

Returns the service's registered handler function.

Pascal

```
function GetServiceController: TServiceController; override;
```

C++

```
virtual __fastcall TServiceController GetServiceController();
```

Description

GetServiceController returns the handler for the service. You do not need to call this function directly. The service object's main function calls it automatically.

Note: Each service in the service application has a main function for that service. When a request is made to start the service, the main thread of the service calls the RegisterServiceCtrlHandler function to register this control handler function. TService automatically calls RegisterServiceCtrlHandler and returns this handler function. Because this function cannot be a class method (member function), the Service application wizard generates code that creates a non-member handler, (ServiceController) for your service object. This routine returns the service object's Handler (Controller).

3.1.2.3.2 TSocketService.Start Method

Pascal

```
procedure Start(Sender: TService; var Started: Boolean);
```

C++

```
__fastcall Start(TService Sender, Boolean Started);
```

Description

This is Start, a member of class TSocketService.

3.1.2.3.3 TSocketService.Stop Method

Pascal

```
procedure Stop(Sender: TService; var Stopped: Boolean);
```

C++

```
__fastcall Stop(TService Sender, Boolean Stopped);
```

Description

This is Stop, a member of class TSocketService.

3.2 Types

The following table lists types in this documentation.

Types

Name	Description
TSocketProc (see page 186)	This is type SckMain.TSocketProc.

3.2.1 SckMain.TSocketProc Type

Pascal

```
TSocketProc = procedure (Item: TListItem; Socket: TCustomWinSocket) of object;
```

C++

```
(Item: TListItem; Socket: TCustomWinSocket) ( TSocketProc)();
```

File

SckMain

Description

This is type SckMain.TSocketProc.

3.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
SocketForm (see page 187)	This is variable SocketMain.SocketForm.
SocketService (see page 187)	This is variable SocketMain.SocketService.

3.3.1 SocketMain.SocketForm Variable

Pascal

```
SocketForm: TSocketForm;
```

C++

```
TSocketForm SocketForm;
```

File

SocketMain

Description

This is variable SocketMain.SocketForm.

3.3.2 SocketMain.SocketService Variable

Pascal

```
SocketService: TSocketService;
```

C++

```
TSocketService SocketService;
```

File

SocketMain

Description

This is variable SocketMain.SocketService.

3.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
UI_INITIALIZE (see page 188)	This is constant SckttMain.UI_INITIALIZE.
WM_MIDASICON (see page 188)	This is constant SckttMain.WM_MIDASICON.

3.4.1 SckttMain.UI_INITIALIZE Constant

Pascal

```
UI_INITIALIZE = WM_MIDASICON + 1;
```

C++

```
UI_INITIALIZE = WM_MIDASICON + 1;
```

File

SckttMain

Description

This is constant SckttMain.UI_INITIALIZE.

3.4.2 SckttMain.WM_MIDASICON Constant

Pascal

```
WM_MIDASICON = WM_USER + 1;
```

C++

```
WM_MIDASICON = WM_USER + 1;
```

File

SckttMain

Description

This is constant SckttMain.WM_MIDASICON.

4 SConnect Namespace

This is namespace SConnect.

Topics

Name	Description
Classes (see page 191)	The following table lists classes in this documentation.
Interfaces (see page 266)	The following table lists interfaces in this documentation.
Functions (see page 282)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 283)	The following table lists structs, records, enums in this documentation.
Types (see page 284)	The following table lists types in this documentation.
Variables (see page 286)	The following table lists variables in this documentation.
Constants (see page 288)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInterpreterError (see page 191)	EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.
	ESocketConnectionError (see page 192)	ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 221).
	TCustomDataBlockInterpreter (see page 192)	TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.
	TDataBlock (see page 197)	This is class SConnect.TDataBlock.
	TDataBlockInterpreter (see page 207)	TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.
	TDataDispatch (see page 215)	This is class SConnect.TDataDispatch.
	TPacketInterceptFactory (see page 219)	TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.
	TSocketConnection (see page 221)	TSocketConnection uses Windows sockets to manage the connection to an application server.
	TSocketTransport (see page 229)	This is class SConnect.TSocketTransport.
	TStreamedConnection (see page 236)	TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.
	TTransportThread (see page 248)	This is class SConnect.TTransportThread.
	TWebConnection (see page 254)	TWebConnection uses HTTP to manage the connection to an application server.

Constants

Name	Description
asCreateObject (see page 288)	This is constant SConnect.asCreateObject.

asError (see page 288)	This is constant SConnect.asError.
asFreeObject (see page 289)	This is constant SConnect.asFreeObject.
asGetAppServers (see page 289)	This is constant SConnect.asGetAppServers.
asGetGUID (see page 289)	This is constant SConnect.asGetGUID.
asGetID (see page 290)	This is constant SConnect.asGetID.
asGetServers (see page 290)	This is constant SConnect.asGetServers.
asInvoke (see page 290)	This is constant SConnect.asInvoke.
asMask (see page 291)	This is constant SConnect.asMask.
asSoapCommand (see page 291)	This is constant SConnect.asSoapCommand.
CallSig (see page 291)	This is constant SConnect.CallSig.
ResultSig (see page 292)	This is constant SConnect.ResultSig.
THREAD_EXCEPTION (see page 292)	This is constant SConnect.THREAD_EXCEPTION.
THREAD_RECEIVEDSTREAM (see page 292)	This is constant SConnect.THREAD_RECEIVEDSTREAM.
THREAD_REPLACETRANSPORT (see page 293)	This is constant SConnect.THREAD_REPLACETRANSPORT.
THREAD_SENDNOTIFY (see page 293)	This is constant SConnect.THREAD_SENDNOTIFY.
THREAD_SENDSTREAM (see page 293)	This is constant SConnect.THREAD_SENDSTREAM.

Functions

	Name	Description
	GetPacketInterceptorList (see page 282)	This is function SConnect.GetPacketInterceptorList.
	LoadWinSock2 (see page 282)	This is function SConnect.LoadWinSock2.

Interfaces

	Name	Description
	IDataBlock (see page 266)	IDataBlock is the interface used by data block interpreters to access memory buffers.
	IDataIntercept (see page 274)	IDataIntercept is the interface used by TSocketConnection (see page 221) components to transform data that is communicated over the connection.
	ISendDataBlock (see page 276)	ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.
	ITransport (see page 278)	ITransport is the interface used by TStreamedConnection (see page 236) to connect to, read from, and write to a remote application server.

Structs, Records, Enums

	Name	Description
	TVarFlag (see page 283)	This is record SConnect.TVarFlag.

Types

Name	Description
PIntArray (see page 284)	This is type SConnect.PIntArray.
PVariantArray (see page 284)	This is type SConnect.PVariantArray.
TIntArray (see page 285)	This is type SConnect.TIntArray.
TVarFlags (see page 285)	This is type SConnect.TVarFlags.
TVariantArray (see page 285)	This is type SConnect.TVariantArray.

Variables

Name	Description
WSACloseEvent (see page 286)	This is variable SConnect.WSACloseEvent.
WSACreateEvent (see page 286)	This is variable SConnect.WSACreateEvent.
WSAEventSelect (see page 287)	This is variable SConnect.WSAEventSelect.
WSAResetEvent (see page 287)	This is variable SConnect.WSAResetEvent.

4.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInterpreterError (see page 191)	EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.
	ESocketConnectionError (see page 192)	ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 221).
	TCustomDataBlockInterpreter (see page 192)	TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.
	TDataBlock (see page 197)	This is class SConnect.TDataBlock.
	TDataBlockInterpreter (see page 207)	TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.
	TDataDispatch (see page 215)	This is class SConnect.TDataDispatch.
	TPacketInterceptFactory (see page 219)	TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.
	TSocketConnection (see page 221)	TSocketConnection uses Windows sockets to manage the connection to an application server.
	TSocketTransport (see page 229)	This is class SConnect.TSocketTransport.
	TStreamedConnection (see page 236)	TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.
	TTransportThread (see page 248)	This is class SConnect.TTransportThread.
	TWebConnection (see page 254)	TWebConnection uses HTTP to manage the connection to an application server.

4.1.1 EInterpreterError Class

EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.

Class Hierarchy

Pascal

```
EInterpreterError = class(Exception);
```

C++

```
class EInterpreterError : public Exception;
```

File

SConnect

Description

Data block interpreters (TCustomDataBlockInterpreter (see page 192) descendants) raise EInterpreterError when they can't interpret the information in a data block. Streamed connection components such as TSocketConnection (see page 221) use data block interpreters to send interface calls to and receive interface calls from a remote application server.

See Also

TCustomDataBlockInterpreter (see page 192)

TSocketConnection (see page 221)

TSoapConnection (see page 1188)

TWebConnection (see page 254)

4.1.2 ESocketConnectionError Class

ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 221).

Class Hierarchy

Pascal

```
ESocketConnectionError = class(Exception);
```

C++

```
class ESocketConnectionError : public Exception;
```

File

SConnect

Description

Socket connection components raise ESocketConnectionError when the socket they use to send and receive messages reports an error, or when the information read from the socket is incomplete.

See Also

TSocketConnection (see page 221)

4.1.3 TCustomDataBlockInterpreter Class

TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.

Class Hierarchy

Pascal

```
TCustomDataBlockInterpreter = class;
```

C++

```
class TCustomDataBlockInterpreter;
```

File

SConnect

Description

TCustomDataBlockInterpreter introduces the methods needed for marshaling the messages that pass between a client application and an application server in a multi-tiered database application.

Streamed connection components use data block interpreters to marshal of messages sent to and received from an application server. An object that supports the IDataBlock (see page 266) interface stores the messages themselves.

See Also

TStreamedConnection (see page 236)

IDataBlock (see page 266)

4.1.3.1 TCustomDataBlockInterpreter Members

The following tables list the members exposed by TCustomDataBlockInterpreter.

Protected Methods

	Name	Description
	AddDispatch (see page 194)	This is AddDispatch, a member of class TCustomDataBlockInterpreter.
	CallCreateObject (see page 194)	This is CallCreateObject, a member of class TCustomDataBlockInterpreter.
	CallFreeObject (see page 194)	This is CallFreeObject, a member of class TCustomDataBlockInterpreter.
	CallGetIDsOfNames (see page 194)	This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.
	CallGetServerList (see page 195)	This is CallGetServerList, a member of class TCustomDataBlockInterpreter.
	CallInvoke (see page 195)	This is CallInvoke, a member of class TCustomDataBlockInterpreter.
	CanCreateObject (see page 195)	This is CanCreateObject, a member of class TCustomDataBlockInterpreter.
	CreateObject (see page 195)	This is CreateObject, a member of class TCustomDataBlockInterpreter.
	InternalCreateObject (see page 195)	This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.
	LockObject (see page 196)	This is LockObject, a member of class TCustomDataBlockInterpreter.
	ReleaseObject (see page 196)	This is ReleaseObject, a member of class TCustomDataBlockInterpreter.
	RemoveDispatch (see page 196)	This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.
	StoreObject (see page 197)	This is StoreObject, a member of class TCustomDataBlockInterpreter.
	UnlockObject (see page 197)	This is UnlockObject, a member of class TCustomDataBlockInterpreter.

Public Methods

	Name	Description
	InterpretData (see page 196)	This is InterpretData, a member of class TCustomDataBlockInterpreter.

4.1.3.2 TCustomDataBlockInterpreter Methods

The methods of the TCustomDataBlockInterpreter class are listed here.

Protected Methods

	Name	Description
	AddDispatch (see page 194)	This is AddDispatch, a member of class TCustomDataBlockInterpreter.
	CallCreateObject (see page 194)	This is CallCreateObject, a member of class TCustomDataBlockInterpreter.
	CallFreeObject (see page 194)	This is CallFreeObject, a member of class TCustomDataBlockInterpreter.
	CallGetIDsOfNames (see page 194)	This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.
	CallGetServerList (see page 195)	This is CallGetServerList, a member of class TCustomDataBlockInterpreter.
	CallInvoke (see page 195)	This is CallInvoke, a member of class TCustomDataBlockInterpreter.
	CanCreateObject (see page 195)	This is CanCreateObject, a member of class TCustomDataBlockInterpreter.
	CreateObject (see page 195)	This is CreateObject, a member of class TCustomDataBlockInterpreter.
	InternalCreateObject (see page 195)	This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.
	LockObject (see page 196)	This is LockObject, a member of class TCustomDataBlockInterpreter.
	ReleaseObject (see page 196)	This is ReleaseObject, a member of class TCustomDataBlockInterpreter.
	RemoveDispatch (see page 196)	This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.
	StoreObject (see page 197)	This is StoreObject, a member of class TCustomDataBlockInterpreter.

	UnlockObject (see page 197)	This is UnlockObject, a member of class TCustomDataBlockInterpreter.

Public Methods

	Name	Description
	InterpretData (see page 196)	This is InterpretData, a member of class TCustomDataBlockInterpreter.

4.1.3.2.1 TCustomDataBlockInterpreter.AddDispatch Method

Pascal

```
procedure AddDispatch(Value: TDataDispatch); virtual; abstract;
```

C++

```
virtual __fastcall AddDispatch(TDataDispatch Value) = 0;
```

Description

This is AddDispatch, a member of class TCustomDataBlockInterpreter.

4.1.3.2.2 TCustomDataBlockInterpreter.CallCreateObject Method

Pascal

```
function CallCreateObject(Name: string): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CallCreateObject(UnicodeString Name) = 0;
```

Description

This is CallCreateObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.3 TCustomDataBlockInterpreter.CallFreeObject Method

Pascal

```
procedure CallFreeObject(DispatchIndex: Integer); virtual; abstract;
```

C++

```
virtual __fastcall CallFreeObject(int DispatchIndex) = 0;
```

Description

This is CallFreeObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.4 TCustomDataBlockInterpreter.CallGetIDsOfNames Method

Pascal

```
function CallGetIDsOfNames(DispatchIndex: Integer; const IID: TGUID; Names: Pointer;
NameCount: Integer; LocaleID: Integer; DispIDs: Pointer): HResult; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT CallGetIDsOfNames(int DispatchIndex, const TGUID IID,
void * Names, int NameCount, int LocaleID, void * DispIDs) = 0;
```

Description

This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.

4.1.3.2.5 TCustomDataBlockInterpreter.CallGetServerList Method

Pascal

```
function CallGetServerList: OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CallGetServerList() = 0;
```

Description

This is CallGetServerList, a member of class TCustomDataBlockInterpreter.

4.1.3.2.6 TCustomDataBlockInterpreter.CallInvoke Method

Pascal

```
function CallInvoke(DispatchIndex: Integer; DispID: Integer; const IID: TGUID; LocaleID:
Integer; Flags: Word; var Params; VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer):
HResult; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT CallInvoke(int DispatchIndex, int DispID, const TGUID
IID, int LocaleID, Word Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr) = 0;
```

Description

This is CallInvoke, a member of class TCustomDataBlockInterpreter.

4.1.3.2.7 TCustomDataBlockInterpreter.CanCreateObject Method

Pascal

```
function CanCreateObject(const ClassID: TGUID): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean CanCreateObject(const TGUID ClassID) = 0;
```

Description

This is CanCreateObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.8 TCustomDataBlockInterpreter.CreateObject Method

Pascal

```
function CreateObject(const Name: string): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CreateObject(const UnicodeString Name) = 0;
```

Description

This is CreateObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.9 TCustomDataBlockInterpreter.InternalCreateObject Method

Pascal

```
function InternalCreateObject(const ClassID: TGUID): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant InternalCreateObject(const TGUID ClassID) = 0;
```

Description

This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.10 TCustomDataBlockInterpreter.InterpretData Method

Pascal

```
procedure InterpretData(const Data: IDataBlock); virtual; abstract;
```

C++

```
virtual __fastcall InterpretData(const IDataBlock Data) = 0;
```

Description

This is InterpretData, a member of class TCustomDataBlockInterpreter.

4.1.3.2.11 TCustomDataBlockInterpreter.LockObject Method

Pascal

```
function LockObject(ID: Integer): IDispatch; virtual; abstract;
```

C++

```
virtual __fastcall IDispatch LockObject(int ID) = 0;
```

Description

This is LockObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.12 TCustomDataBlockInterpreter.ReleaseObject Method

Pascal

```
procedure ReleaseObject(ID: Integer); virtual; abstract;
```

C++

```
virtual __fastcall ReleaseObject(int ID) = 0;
```

Description

This is ReleaseObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.13 TCustomDataBlockInterpreter.RemoveDispatch Method

Pascal

```
procedure RemoveDispatch(Value: TDataDispatch); virtual; abstract;
```

C++

```
virtual __fastcall RemoveDispatch(TDataDispatch Value) = 0;
```

Description

This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.

4.1.3.2.14 TCustomDataBlockInterpreter.StoreObject Method

Pascal

```
function StoreObject(const Value: OleVariant): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int StoreObject(const OleVariant Value) = 0;
```

Description

This is StoreObject, a member of class TCustomDataBlockInterpreter.

4.1.3.2.15 TCustomDataBlockInterpreter.UnlockObject Method

Pascal

```
procedure UnlockObject(ID: Integer; const Disp: IDispatch); virtual; abstract;
```

C++

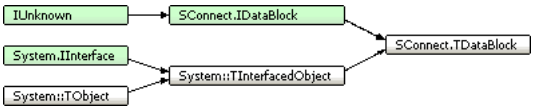
```
virtual __fastcall UnlockObject(int ID, const IDispatch Disp) = 0;
```

Description

This is UnlockObject, a member of class TCustomDataBlockInterpreter.

4.1.4 TDataBlock Class

Class Hierarchy



Pascal

```
TDataBlock = class(TInterfacedObject, IDataBlock);
```

C++

```
class TDataBlock : public TInterfacedObject, public IDataBlock;
```

File

SConnect

Description

This is class SConnect.TDataBlock.

4.1.4.1 TDataBlock Members

The following tables list the members exposed by TDataBlock.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	Clear (see page 200)	Removes all data from Memory except for the reserved bytes.
	GetBytesReserved (see page 201)	Returns the value of the BytesReserved property.
	GetMemory (see page 201)	Returns the value of the Memory property.
	GetSignature (see page 201)	Returns the value of the Signature property.
	GetSize (see page 202)	Returns the value of the Size property.
	GetStream (see page 202)	Returns the value of the Stream property.
	IgnoreStream (see page 202)	Informs the data block when its stream is invalidated.
	InitData (see page 202)	Adds data to the data block.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	Read (see page 203)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 203)	Sets the value of the Signature property.
	SetSize (see page 204)	Sets the value of the Size property.
	Write (see page 204)	Writes a specified number of bytes from a buffer.

Protected Properties

	Name	Description
R	BytesReserved (see page 205)	Indicates the number of bytes from Memory that are reserved for internal use.
R	Memory (see page 205)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 206)	Indicates the contents of the data block.
	Size (see page 206)	Indicates the size of the data in the memory buffer.
R	Stream (see page 206)	Provides access to an internal stream that contains the data block's memory.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 199)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 199)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.

	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

4.1.4.2 TDataBlock.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataBlock();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

4.1.4.3 TDataBlock.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataBlock();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

4.1.4.4 TDataBlock Methods

The methods of the TDataBlock class are listed here.

Protected Methods

	Name	Description
	Clear (see page 200)	Removes all data from Memory except for the reserved bytes.
	GetBytesReserved (see page 201)	Returns the value of the BytesReserved property.
	GetMemory (see page 201)	Returns the value of the Memory property.
	GetSignature (see page 201)	Returns the value of the Signature property.
	GetSize (see page 202)	Returns the value of the Size property.
	GetStream (see page 202)	Returns the value of the Stream property.
	IgnoreStream (see page 202)	Informs the data block when its stream is invalidated.
	InitData (see page 202)	Adds data to the data block.
	Read (see page 203)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 203)	Sets the value of the Signature property.
	SetSize (see page 204)	Sets the value of the Size property.
	Write (see page 204)	Writes a specified number of bytes from a buffer.

4.1.4.4.1 TDataBlock.Clear Method

Removes all data from Memory except for the reserved bytes.

Pascal

```
procedure Clear; stdcall;
```

C++

```
__fastcall __stdcall Clear();
```

Description

Call Clear when finished reading from Memory or when the information written to Memory has been used. Clear reclaims the

resources used to store information that is read from or written to the data block.

See Also

BytesReserved (see page 272)

Memory (see page 272)

4.1.4.4.2 TDataBlock.GetBytesReserved Method

Returns the value of the BytesReserved property.

Pascal

```
function GetBytesReserved: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetBytesReserved();
```

Description

GetBytesReserved is the read implementer for the BytesReserved property.

See Also

BytesReserved (see page 272)

4.1.4.4.3 TDataBlock.GetMemory Method

Returns the value of the Memory property.

Pascal

```
function GetMemory: Pointer; stdcall;
```

C++

```
__fastcall __stdcall void * GetMemory();
```

Description

GetMemory is the read implementer for the Memory property.

See Also

Memory (see page 272)

4.1.4.4.4 TDataBlock.GetSignature Method

Returns the value of the Signature property.

Pascal

```
function GetSignature: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSignature();
```

Description

GetSignature is the read implementer for the Signature property.

See Also

Signature (see page 273)

4.1.4.4.5 TDataBlock.GetSize Method

Returns the value of the Size property.

Pascal

```
function GetSize: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSize();
```

Description

GetSize is the read implementer for the Size property.

See Also

Size (see page 273)

4.1.4.4.6 TDataBlock.GetStream Method

Returns the value of the Stream property.

Pascal

```
function GetStream: TStream; stdcall;
```

C++

```
__fastcall __stdcall TStream GetStream();
```

Description

GetStream is the read implementer for the Stream property.

See Also

Stream (see page 274)

4.1.4.4.7 TDataBlock.IgnoreStream Method

Informs the data block when its stream is invalidated.

Pascal

```
procedure IgnoreStream; stdcall;
```

C++

```
__fastcall __stdcall IgnoreStream();
```

Description

Call IgnoreStream after taking responsibility for freeing the component specified by Stream. After a call to IgnoreStream, the data block will not free the memory for its internal Stream component.

See Also

Stream (see page 274)

4.1.4.4.8 TDataBlock.InitData Method

Adds data to the data block.

Pascal

```
function InitData(Data: Pointer; DataLen: Integer; CheckLen: Boolean): Integer; stdcall;
```

C++

```
__fastcall __stdcall int InitData(void * Data, int DataLen, Boolean CheckLen);
```

Description

Data is the data to be added to the data block. It must include a valid signature or InitData raises an exception.

DataLen is the number of bytes referenced by Data.

CheckLen specifies whether InitData should verify that the signature indicates the same amount of data as is indicated by the DataLen parameter.

See Also

Signature (see page 273)

4.1.4.4.9 TDataBlock.Read Method

Reads a specified number of bytes into a buffer.

Pascal

```
function Read(var Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Read( Buffer, int Count);
```

Description

Call Read to copy the contents stored in the memory buffer to the buffer supplied by the Buffer parameter. Read reads up to Count bytes and returns the number of bytes actually read.

The first call to Read begins reading from Memory at the first position after the reserved bytes. Subsequent calls begin reading at the point where the last call to Read left off.

Note: The Count parameter should specify a value less than or equal to Size - BytesReserved.

See Also

Write (see page 271)

Memory (see page 272)

Size (see page 273)

BytesReserved (see page 272)

4.1.4.4.10 TDataBlock.SetSignature Method

Sets the value of the Signature property.

Pascal

```
procedure SetSignature(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSignature(int Value);
```

Description

SetSignature is the write implementer for the Signature property.

See Also

Signature (see page 273)

4.1.4.4.11 TDataBlock.SetSize Method

Sets the value of the Size property.

Pascal

```
procedure SetSize(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSize(int Value);
```

Description

SetSize is the write implementer for the Size property.

See Also

Size (see page 273)

4.1.4.4.12 TDataBlock.Write Method

Writes a specified number of bytes from a buffer.

Pascal

```
function Write(const Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Write(const  Buffer, int Count);
```

Description

Call Write to copy the contents of the buffer supplied as the Buffer parameter to the next position in Memory. Write writes up to Count bytes and returns the number of bytes actually written.

The first call to Write begins writing to Memory at the first position after the reserved bytes. Subsequent calls begin writing at the point where the last call to Write left off.

Note: The Count parameter should specify a value less than or equal to Size - BytesReserved.

See Also

Read (see page 270)

Memory (see page 272)

Size (see page 273)

BytesReserved (see page 272)

4.1.4.5 TDataBlock Properties

The properties of the TDataBlock class are listed here.

Protected Properties

	Name	Description
	BytesReserved (see page 205)	Indicates the number of bytes from Memory that are reserved for internal use.
	Memory (see page 205)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 206)	Indicates the contents of the data block.
	Size (see page 206)	Indicates the size of the data in the memory buffer.
	Stream (see page 206)	Provides access to an internal stream that contains the data block's memory.

4.1.4.5.1 TDataBlock.BytesReserved Property

Indicates the number of bytes from Memory that are reserved for internal use.

Pascal

```
property BytesReserved: Integer;
```

C++

```
__property int BytesReserved;
```

Description

BytesReserved indicates how many bytes of Memory can't be used for reading and writing. When interpreting the value of the Size property, use BytesReserved to determine how much buffer space is available for reading and writing data.

See Also

Memory (see page 272)

Size (see page 273)

4.1.4.5.2 TDataBlock.Memory Property

Points to a buffer from which data is read or to which data is written.

Pascal

```
property Memory: Pointer;
```

C++

```
__property void * Memory;
```

Description

Memory provides access to the buffer that contains data that is read or written. Memory includes a reserved area (of size BytesReserved) for internal information such as the value of Signature,

Note: When implementing the Receive and Send methods of the ITransport interface, component writers should read directly from and write directly to Memory, rather than using the Read and Write methods. Otherwise, the information in the reserved area will not be sent to or from the application server.

See Also

Size (see page 273)

ITransport (see page 278)

BytesReserved (see page 272)

Signature (see page 273)

Stream (see page 274)

4.1.4.5.3 TDataBlock.Signature Property

Indicates the contents of the data block.

Pascal

```
property Signature: Integer;
```

C++

```
__property int Signature;
```

Description

Write Signature values to indicate what type of data is written to the data block. Read Signature to determine what type of data can be read from the data block.

The value of signature is stored somewhere in the first BytesReserved bytes of Memory.

See Also

BytesReserved (see page 272)

Memory (see page 272)

4.1.4.5.4 TDataBlock.Size Property

Indicates the size of the data in the memory buffer.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is the number of bytes available in Memory, excluding the reserved bytes. Set Size to ensure that Memory is large enough to contain the data that the data block will read or write.

See Also

BytesReserved (see page 272)

Memory (see page 272)

Signature (see page 273)

4.1.4.5.5 TDataBlock.Stream Property

Provides access to an internal stream that contains the data block's memory.

Pascal

```
property Stream: TStream;
```

C++

```
__property TStream Stream;
```

Description

Stream allows component writers more convenient access to the data block's memory buffer. This memory buffer contains the data that is read or written.

See Also

Memory (see page 272)

IgnoreStream (see page 269)

TMemoryStream

4.1.5 TDataBlockInterpreter Class

TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.

Class Hierarchy

Pascal

```
TDataBlockInterpreter = class(TCustomDataBlockInterpreter);
```

C++

```
class TDataBlockInterpreter : public TCustomDataBlockInterpreter;
```

File

SConnect

Description

Many streamed connection components use TDataBlockInterpreter to handle the marshaling of messages sent to and received from an application server. An object that supports the IDataBlock (see page 266) interface stores the messages themselves.

See Also

TStreamedConnection (see page 236)

IDataBlock (see page 266)

TSocketConnection (see page 221)

TWebConnection (see page 254)

4.1.5.1 TDataBlockInterpreter Members

The following tables list the members exposed by TDataBlockInterpreter.

Protected Methods

	Name	Description
	AddDispatch (see page 209)	This is AddDispatch, a member of class TDataBlockInterpreter.
	CallFreeObject (see page 210)	This is CallFreeObject, a member of class TDataBlockInterpreter.
	CallGetIDsOfNames (see page 210)	This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.
	CallGetServerList (see page 210)	This is CallGetServerList, a member of class TDataBlockInterpreter.
	CallInvoke (see page 211)	This is CallInvoke, a member of class TDataBlockInterpreter.
	CanCreateObject (see page 211)	This is CanCreateObject, a member of class TDataBlockInterpreter.
	CreateObject (see page 211)	This is CreateObject, a member of class TDataBlockInterpreter.
	DoCreateObject (see page 211)	This is DoCreateObject, a member of class TDataBlockInterpreter.
	DoCustomAction (see page 211)	This is DoCustomAction, a member of class TDataBlockInterpreter.
	DoFreeObject (see page 212)	This is DoFreeObject, a member of class TDataBlockInterpreter.

	DoGetAppServerList (see page 212)	This is DoGetAppServerList, a member of class TDataBlockInterpreter.
	DoGetIDsOfNames (see page 212)	This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.
	DoGetServerList (see page 212)	This is DoGetServerList, a member of class TDataBlockInterpreter.
	DoInvoke (see page 213)	This is DoInvoke, a member of class TDataBlockInterpreter.
V	InternalCreateObject (see page 213)	This is InternalCreateObject, a member of class TDataBlockInterpreter.
V	LockObject (see page 213)	This is LockObject, a member of class TDataBlockInterpreter.
V	ReleaseObject (see page 214)	This is ReleaseObject, a member of class TDataBlockInterpreter.
V	RemoveDispatch (see page 214)	This is RemoveDispatch, a member of class TDataBlockInterpreter.
V	StoreObject (see page 214)	This is StoreObject, a member of class TDataBlockInterpreter.
V	UnlockObject (see page 214)	This is UnlockObject, a member of class TDataBlockInterpreter.

Public Methods

	Name	Description
V	CallCreateObject (see page 210)	Creates a COM object on a remote application server given its class name.
	Create (see page 208)	Creates and initializes an instance of TDataBlockInterpreter (see page 207).
V	Destroy (see page 208)	Destroys an instance of TDataBlockInterpreter (see page 207).
V	InterpretData (see page 213)	Interprets a call received from a remote application server.

4.1.5.2 TDataBlockInterpreter.Create Constructor

Creates and initializes an instance of TDataBlockInterpreter (see page 207).

Pascal

```
constructor Create(SendDataBlock: ISendDataBlock; CheckRegValue: string);
```

C++

```
__fastcall TDataBlockInterpreter(ISendDataBlock SendDataBlock, UnicodeString CheckRegValue);
```

Description

Applications should not need to instantiate data block interpreters. Typically, they are instantiated by the streamed connection components that use them to marshal data. To access a streamed connection component's data block interpreter instance, use its Interpreter property.

Create takes two arguments:

An ISendDataBlock (see page 276) interface that the data block interpreter can use to send information in a data block to its destination object (usually the remote data module of an application server).

A string that specifies a registry key value which must appear for application servers that can be accessed using the data block interpreter.

See Also

Interpreter (see page 247)

4.1.5.3 TDataBlockInterpreter.Destroy Destructor

Destroys an instance of TDataBlockInterpreter (see page 207).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataBlockInterpreter();
```

Description

Applications have no need to free data block interpreters. They are freed by the streamed connection component that uses them to marshal interface calls.

See Also

System::TObject::Free (see page 3372)

4.1.5.4 TDataBlockInterpreter Methods

The methods of the TDataBlockInterpreter class are listed here.

Protected Methods

	Name	Description
	AddDispatch (see page 209)	This is AddDispatch, a member of class TDataBlockInterpreter.
	CallFreeObject (see page 210)	This is CallFreeObject, a member of class TDataBlockInterpreter.
	CallGetIDsOfNames (see page 210)	This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.
	CallGetServerList (see page 210)	This is CallGetServerList, a member of class TDataBlockInterpreter.
	CallInvoke (see page 211)	This is CallInvoke, a member of class TDataBlockInterpreter.
	CanCreateObject (see page 211)	This is CanCreateObject, a member of class TDataBlockInterpreter.
	CreateObject (see page 211)	This is CreateObject, a member of class TDataBlockInterpreter.
	DoCreateObject (see page 211)	This is DoCreateObject, a member of class TDataBlockInterpreter.
	DoCustomAction (see page 211)	This is DoCustomAction, a member of class TDataBlockInterpreter.
	DoFreeObject (see page 212)	This is DoFreeObject, a member of class TDataBlockInterpreter.
	DoGetAppServerList (see page 212)	This is DoGetAppServerList, a member of class TDataBlockInterpreter.
	DoGetIDsOfNames (see page 212)	This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.
	DoGetServerList (see page 212)	This is DoGetServerList, a member of class TDataBlockInterpreter.
	DoInvoke (see page 213)	This is DoInvoke, a member of class TDataBlockInterpreter.
	InternalCreateObject (see page 213)	This is InternalCreateObject, a member of class TDataBlockInterpreter.
	LockObject (see page 213)	This is LockObject, a member of class TDataBlockInterpreter.
	ReleaseObject (see page 214)	This is ReleaseObject, a member of class TDataBlockInterpreter.
	RemoveDispatch (see page 214)	This is RemoveDispatch, a member of class TDataBlockInterpreter.
	StoreObject (see page 214)	This is StoreObject, a member of class TDataBlockInterpreter.
	UnlockObject (see page 214)	This is UnlockObject, a member of class TDataBlockInterpreter.

Public Methods

	Name	Description
	CallCreateObject (see page 210)	Creates a COM object on a remote application server given its class name.
	InterpretData (see page 213)	Interprets a call received from a remote application server.

4.1.5.4.1 TDataBlockInterpreter.AddDispatch Method

Pascal

```
procedure AddDispatch(Value: TDataDispatch); override;
```

C++

```
virtual __fastcall AddDispatch(TDataDispatch Value);
```

Description

This is AddDispatch, a member of class TDataBlockInterpreter.

4.1.5.4.2 TDataBlockInterpreter.CallCreateObject Method

Creates a COM object on a remote application server given its class name.

Pascal

```
function CallCreateObject(Name: string): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CallCreateObject(UnicodeString Name);
```

Description

CallCreateObject sends a message to the remote application server, telling it to create an object of the class specified by the Name parameter. Name is the string representation of the Class ID (CLSID). CreateObject (see page 211) returns a reference to an interface that can be used to communicate with the remote COM object.

See Also

CreateOleObject

4.1.5.4.3 TDataBlockInterpreter.CallFreeObject Method

Pascal

```
procedure CallFreeObject(DispatchIndex: Integer); override;
```

C++

```
virtual __fastcall CallFreeObject(int DispatchIndex);
```

Description

This is CallFreeObject, a member of class TDataBlockInterpreter.

4.1.5.4.4 TDataBlockInterpreter.CallGetIDsOfNames Method

Pascal

```
function CallGetIDsOfNames(DispatchIndex: Integer; const IID: TGUID; Names: Pointer;
NameCount: Integer; LocaleID: Integer; DispIDs: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT CallGetIDsOfNames(int DispatchIndex, const TGUID IID, void * Names,
int NameCount, int LocaleID, void * DispIDs);
```

Description

This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.

4.1.5.4.5 TDataBlockInterpreter.CallGetServerList Method

Pascal

```
function CallGetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CallGetServerList();
```

Description

This is CallGetServerList, a member of class TDataBlockInterpreter.

4.1.5.4.6 TDataBlockInterpreter.CallInvoke Method

Pascal

```
function CallInvoke(DispatchIndex: Integer; DispID: Integer; const IID: TGUID; LocaleID:
Integer; Flags: Word; var Params; VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer):
HResult; override;
```

C++

```
virtual __fastcall HRESULT CallInvoke(int DispatchIndex, int DispID, const TGUID IID, int
LocaleID, Word Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is CallInvoke, a member of class TDataBlockInterpreter.

4.1.5.4.7 TDataBlockInterpreter.CanCreateObject Method

Pascal

```
function CanCreateObject(const ClassID: TGUID): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanCreateObject(const TGUID ClassID);
```

Description

This is CanCreateObject, a member of class TDataBlockInterpreter.

4.1.5.4.8 TDataBlockInterpreter.CreateObject Method

Pascal

```
function CreateObject(const Name: string): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CreateObject(const UnicodeString Name);
```

Description

This is CreateObject, a member of class TDataBlockInterpreter.

4.1.5.4.9 TDataBlockInterpreter.DoCreateObject Method

Pascal

```
procedure DoCreateObject(const Data: IDataBlock);
```

C++

```
__fastcall DoCreateObject(const IDataBlock Data);
```

Description

This is DoCreateObject, a member of class TDataBlockInterpreter.

4.1.5.4.10 TDataBlockInterpreter.DoCustomAction Method

Pascal

```
function DoCustomAction(Action: Integer; const Data: IDataBlock): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoCustomAction(int Action, const IDataBlock Data);
```

Description

This is DoCustomAction, a member of class TDataBlockInterpreter.

4.1.5.4.11 TDataBlockInterpreter.DoFreeObject Method

Pascal

```
procedure DoFreeObject(const Data: IDataBlock);
```

C++

```
__fastcall DoFreeObject(const IDataBlock Data);
```

Description

This is DoFreeObject, a member of class TDataBlockInterpreter.

4.1.5.4.12 TDataBlockInterpreter.DoGetAppServerList Method

Pascal

```
procedure DoGetAppServerList(const Data: IDataBlock);
```

C++

```
__fastcall DoGetAppServerList(const IDataBlock Data);
```

Description

This is DoGetAppServerList, a member of class TDataBlockInterpreter.

4.1.5.4.13 TDataBlockInterpreter.DoGetIDsOfNames Method

Pascal

```
procedure DoGetIDsOfNames(const Data: IDataBlock);
```

C++

```
__fastcall DoGetIDsOfNames(const IDataBlock Data);
```

Description

This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.

4.1.5.4.14 TDataBlockInterpreter.DoGetServerList Method

Pascal

```
procedure DoGetServerList(const Data: IDataBlock);
```

C++

```
__fastcall DoGetServerList(const IDataBlock Data);
```

Description

This is DoGetServerList, a member of class TDataBlockInterpreter.

4.1.5.4.15 TDataBlockInterpreter.DoInvoke Method

Pascal

```
procedure DoInvoke(const Data: IDataBlock);
```

C++

```
__fastcall DoInvoke(const IDataBlock Data);
```

Description

This is DoInvoke, a member of class TDataBlockInterpreter.

4.1.5.4.16 TDataBlockInterpreter.InternalCreateObject Method

Pascal

```
function InternalCreateObject(const ClassID: TGUID): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalCreateObject(const TGUID ClassID);
```

Description

This is InternalCreateObject, a member of class TDataBlockInterpreter.

4.1.5.4.17 TDataBlockInterpreter.InterpretData Method

Interprets a call received from a remote application server.

Pascal

```
procedure InterpretData(const Data: IDataBlock); override;
```

C++

```
virtual __fastcall InterpretData(const IDataBlock Data);
```

Description

Call InterpretData to respond to a COM interface call that is marshaled to a data block. The Data parameter specifies an IDataBlock (see page 266) interface that can be used to read the marshaled version of the message.

InterpretData reads the call, interprets it as an IDispatch (see page 3494) call, and performs the appropriate actions (such as invoking a local COM interface).

4.1.5.4.18 TDataBlockInterpreter.LockObject Method

Pascal

```
function LockObject(ID: Integer): IDispatch; override;
```

C++

```
virtual __fastcall IDispatch LockObject(int ID);
```

Description

This is LockObject, a member of class TDataBlockInterpreter.

4.1.5.4.19 TDataBlockInterpreter.ReleaseObject Method

Pascal

```
procedure ReleaseObject(ID: Integer); override;
```

C++

```
virtual __fastcall ReleaseObject(int ID);
```

Description

This is ReleaseObject, a member of class TDataBlockInterpreter.

4.1.5.4.20 TDataBlockInterpreter.RemoveDispatch Method

Pascal

```
procedure RemoveDispatch(Value: TDataDispatch); override;
```

C++

```
virtual __fastcall RemoveDispatch(TDataDispatch Value);
```

Description

This is RemoveDispatch, a member of class TDataBlockInterpreter.

4.1.5.4.21 TDataBlockInterpreter.StoreObject Method

Pascal

```
function StoreObject(const Value: OleVariant): Integer; override;
```

C++

```
virtual __fastcall int StoreObject(const OleVariant Value);
```

Description

This is StoreObject, a member of class TDataBlockInterpreter.

4.1.5.4.22 TDataBlockInterpreter.UnlockObject Method

Pascal

```
procedure UnlockObject(ID: Integer; const Disp: IDispatch); override;
```

C++

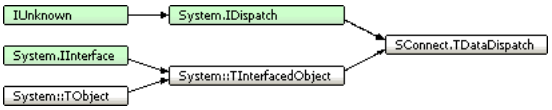
```
virtual __fastcall UnlockObject(int ID, const IDispatch Disp);
```

Description

This is UnlockObject, a member of class TDataBlockInterpreter.

4.1.6 TDataDispatch Class

Class Hierarchy



Pascal

```
TDataDispatch = class(TInterfacedObject, IDispatch);
```

C++

```
class TDataDispatch : public TInterfacedObject, public IDispatch;
```

File

SConnect

Description

This is class SConnect.TDataDispatch.

4.1.6.1 TDataDispatch Members

The following tables list the members exposed by TDataDispatch.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetIDsOfNames (see page 217)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 218)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 218)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 219)	Invoke performs a call to a late-binded property or method.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	DispatchIndex (see page 219)	This is DispatchIndex, a member of class TDataDispatch.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.

	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 216)	This is Create, a member of class TDataDispatch.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 217)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

4.1.6.2 TDataDispatch.Create Constructor

Pascal

```
constructor Create(Interpreter: TCustomDataBlockInterpreter; DispatchIndex: Integer);
```

C++

```
__fastcall TDataDispatch(TCustomDataBlockInterpreter Interpreter, int DispatchIndex);
```

Description

This is Create, a member of class TDataDispatch.

4.1.6.3 TDataDispatch.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataDispatch();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

4.1.6.4 TDataDispatch Methods

The methods of the TDataDispatch class are listed here.

Protected Methods

	Name	Description
	GetIDsOfNames (see page 217)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 218)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 218)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 219)	Invoke performs a call to a late-binded property or method.

4.1.6.4.1 TDataDispatch.GetIDsOfNames Method

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name. GetIDsOfNames is used primarily to obtain dispatch identifiers for the late-binded methods exposed by the COM object through the IDispatch interface.

See Also

GetTypeInfoCount (see page 3496)

GetTypeInfo (see page 3496)

Invoke (see page 3497)

4.1.6.4.2 TDataDispatch.GetTypeInfo Method

GetTypeInfo returns the object's type information.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo returns the type information for a specified index. The index is previously obtained by a call to the GetTypeInfoCount method. If the method returns S_OK, the `TypeInfo` parameter is set to point to the requested type information; otherwise an error code is returned.

See Also

GetTypeInfoCount (see page 3496)

GetIDsOfNames (see page 3495)

Invoke (see page 3497)

4.1.6.4.3 TDataDispatch.GetTypeInfoCount Method

GetTypeInfoCount returns the count of type information interfaces.

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount returns the count of type information interfaces supported by the implementing COM object. If the method returns S_OK, the `Count` parameter is set to the number of type information interfaces, which is either 1 (if the object supports type information) or 0 (if the object does not support type information). A return value of E_NOTIMPL means that the method is not implemented in the COM object.

See Also

GetTypeInfo (see page 3496)

GetIDsOfNames (see page 3495)

Invoke (see page 3497)

4.1.6.4.4 TDataDispatch.Invoke Method

Invoke performs a call to a late-binded property or method.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke actually calls a method or a property exposed by the COM object through IDispatch. Invoke requires a previously obtained dispatch identifier. The identifier uniquely identifies a method, a property, and a list of parameters to be passed to the called method and exception information. The dispatch identifier of a method or property (also known as **dispid**) can be obtained by a calling the GetIDsOfNames method.

See Also

GetTypeInfoCount (see page 3496)

GetTypeInfo (see page 3496)

GetIDsOfNames (see page 3495)

4.1.6.5 TDataDispatch Properties

The properties of the TDataDispatch class are listed here.

Protected Properties

	Name	Description
	DispatchIndex (see page 219)	This is DispatchIndex, a member of class TDataDispatch.

4.1.6.5.1 TDataDispatch.DispatchIndex Property

Pascal

```
property DispatchIndex: Integer;
```

C++

```
__property int DispatchIndex;
```

Description

This is DispatchIndex, a member of class TDataDispatch.

4.1.7 TPacketInterceptFactory Class

TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.

Class Hierarchy

Pascal

```
TPacketInterceptFactory = class(TComObjectFactory);
```

C++

```
class TPacketInterceptFactory : public TComObjectFactory;
```

File

SConnect

Description

In Delphi, use TPacketInterceptFactory as the class factory for COM objects that implement the IDataIntercept (see page 274) interface. Data packet interceptors implement the IDataIntercept (see page 274) interface, which they use in multi-tiered database applications to modify the data that passes between a socket connection component in the client application and scktsrvr.exe on the server. TPacketInterceptFactory registers the data packet interceptor so that can appear in the drop-down list of the Object Inspector when setting the socket connection's InterceptName property and in the corresponding list in the properties dialog of scktsrvr.exe.

TPacketInterceptFactory supports the IUnknown (see page 3756), IClassFactory, and IClassFactory2 interfaces. The IClassFactory interface is implemented by class objects associated with class identifiers (CLSIDs) for the classes that they instantiate. IClassFactory must be implemented for every object definition, so that objects of that type can be created. The IClassFactory2 interface is implemented by class factories for classes that need support for licensing.

IDataIntercept (see page 274)

Specifying a Connection Using Sockets

4.1.7.1 TPacketInterceptFactory Members

The following tables list the members exposed by TPacketInterceptFactory.

Public Methods

	Name	Description
	UpdateRegistry (see page 221)	Registers or unregisters COM objects created by the factory.

4.1.7.2 TPacketInterceptFactory Methods

The methods of the TPacketInterceptFactory class are listed here.

Public Methods

	Name	Description
	UpdateRegistry (see page 221)	Registers or unregisters COM objects created by the factory.

4.1.7.2.1 TPacketInterceptFactory.UpdateRegistry Method

Registers or unregisters COM objects created by the factory.

Pascal

```
procedure UpdateRegistry(Register: Boolean); override;
```

C++

```
virtual __fastcall UpdateRegistry(Boolean Register);
```

Description

UpdateRegistry is called for EXEs when the EXE is run, and for DLLs or EXEs when the routines are called to specifically register or unregister the server.

In addition to the standard COM registration that allows clients to instantiate the data packet interceptor that this factory creates, TPacketInterceptFactory (see page 219) also registers its associated COM object as a data packet interceptor. This allows the object's ProgID to appear in the drop-down list for a socket connection's InterceptName property, and to appear in the corresponding list on the properties dialog for scktsrvr.exe.

4.1.8 TSocketConnection Class

TSocketConnection uses Windows sockets to manage the connection to an application server.

Class Hierarchy

Pascal

```
TSocketConnection = class(TStreamedConnection);
```

C++

```
class TSocketConnection : public TStreamedConnection;
```

File

SConnect

Description

TSocketConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The Socket connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Call into a separate COM object that encodes and decodes the content of messages.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TSocketConnection establishes the initial connection between the client application and a remote application server using TCP/IP. To use TSocketConnection, the application server must be running SocktSrvr.exe.

Once the connection is established, the client registers any or all of its client datasets, and these client datasets use the IAppServer interface from the socket connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection component instead. To connect to remote application servers using HTTP, use the TWebConnection (see page 254) component instead. To connect using SOAP, use the TSoapConnection component.

Specifying a Connection Using Sockets

4.1.8.1 TSocketConnection Members

The following tables list the members exposed by TSocketConnection.

Protected Methods

	Name	Description
	_AddRef (see page 239)	Increments an internal reference counter.
	_Release (see page 239)	Decrements an internal reference counter.
V	CreateTransport (see page 224)	Returns an ITransport (see page 278) interface that can be used to connect to and communicate with the application server.
V	DoConnect (see page 224)	Connects to a remote application server.
V	DoDisconnect (see page 240)	Disconnects from an application server.
V	DoError (see page 241)	raises an exception for a specified exception object.
V	GetInterpreter (see page 242)	Returns the value of the Interpreter (see page 247) property.
V	InternalClose (see page 242)	Terminates a connection to the application server.
V	InternalOpen (see page 243)	Opens a connection to the application server.
	QueryInterface (see page 243)	Implements the IUnknown (see page 3756) QueryInterface method.
	Send (see page 244)	Sends an interface call to the application server and returns the response.
	ThreadException (see page 244)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 244)	Handles callbacks from the application server.
	WndProc (see page 245)	Dispatches messages from the transport layer.

Protected Properties

	Name	Description
R	Handle (see page 246)	Provides access to an internal window handle that can receive messages from the transport layer.

	Interpreter (see page 247)	Provides access to the helper object that marshals interface calls for the streamed connection.

Public Methods

	Name	Description
	Create (see page 223)	Creates and initializes an instance of TSocketConnection (see page 221).
	Destroy (see page 238)	Disposes of a TStreamedConnection (see page 236) instance.
	GetInterceptorList (see page 241)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
	GetServerList (see page 242)	Retrieves a list of registered data brokers from the remote server system.
	Send (see page 277)	Sends information retrieved from an IDataBlock (see page 266) interface to the application server.

Published Properties

	Name	Description
	Address (see page 225)	Specifies the IP address of the server.
	Host (see page 226)	Specifies the host name of the server.
	InterceptGUID (see page 226)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 227)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
	ObjectBroker (see page 228)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Port (see page 228)	Specifies the port number of the socket dispatcher application on the server system.
	SupportCallbacks (see page 229)	Determines whether the streamed connection component can handle callbacks in the application server interface.

4.1.8.2 TSocketConnection.Create Constructor

Creates and initializes an instance of TSocketConnection (see page 221).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSocketConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TSocketConnection (see page 221) object at runtime. Socket connection components added to forms or data modules at design time are created automatically.

Create overrides the inherited constructor to initialize the Port (see page 228) property to 211.

See Also

Create (see page 237)

Port (see page 228)

4.1.8.3 TSocketConnection Methods

The methods of the TSocketConnection class are listed here.

Protected Methods

	Name	Description
	CreateTransport (see page 224)	Returns an ITransport (see page 278) interface that can be used to connect to and communicate with the application server.
	DoConnect (see page 224)	Connects to a remote application server.

4.1.8.3.1 TSocketConnection.CreateTransport Method

Returns an ITransport (see page 278) interface that can be used to connect to and communicate with the application server.

Pascal

```
function CreateTransport: ITransport; override;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Socket connection components use an ITransport (see page 278) interface to connect to and communicate with the application server. CreateTransport instantiates the internal helper object that connects to the socket dispatcher on the server and sends or receives messages. CreateTransport passes the values of the Host (see page 226), Address (see page 225) and Port (see page 228) properties to this helper object and returns its ITransport (see page 278) interface.

See Also

Host (see page 226)

Address (see page 225)

Port (see page 228)

4.1.8.3.2 TSocketConnection.DoConnect Method

Connects to a remote application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is used internally to connect to the application server when the Connected property is set to true. If the Host (see page 226) or Address (see page 225) and Port (see page 228) properties are set, DoConnect uses these to locate the socket on the server machine. Otherwise, if the ObjectBroker (see page 228) property is set, it obtains these values from the object broker.

Once the server machine is located, DoConnect opens a connection.

Note: When ObjectBroker (see page 228) is nil (Delphi) or NULL (C++), the values of Host (see page 226), Address (see page 225), and Port (see page 228) are saved with the socket connection component. If ObjectBroker (see page 228) is not nil (Delphi) or NULL (C++), these values are not saved from design time. However, once these values are set (either by values obtained from the Object Broker or by values specified in code at runtime), they are used every time a connection must be re-established. If these values subsequently fail, the socket connection component fetches new values from the Object Broker.

Port (see page 228)

ObjectBroker

4.1.8.4 TSocketConnection Properties

The properties of the TSocketConnection class are listed here.

Published Properties

	Name	Description
	Address (see page 225)	Specifies the IP address of the server.
	Host (see page 226)	Specifies the host name of the server.
	InterceptGUID (see page 226)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 227)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
	ObjectBroker (see page 228)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Port (see page 228)	Specifies the port number of the socket dispatcher application on the server system.
	SupportCallbacks (see page 229)	Determines whether the streamed connection component can handle callbacks in the application server interface.

4.1.8.4.1 TSocketConnection.Address Property

Specifies the IP address of the server.

Pascal

```
property Address: string;
```

C++

```
__property UnicodeString Address;
```

Description

Use Address to specify the IP address of the application server to which the client application connects. In addition to the address, you must provide a value for the Port (see page 228) property so that the socket connection component can locate the listening socket on the server system.

Sockets (see page 1367) require either an IP address or a Host (see page 226) name to locate the server system. You can use the Host (see page 226) property instead of the Address property to specify the server system using a host name. The Address and Host (see page 226) properties are mutually exclusive: Setting Address causes Host (see page 226) to be set to an empty string, and vice versa.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Address property. Instead, the Object Broker supplies an Address for a server that is located dynamically at runtime. Explicitly setting the Address property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection component.

See Also

Host (see page 226)

Port (see page 228)

ObjectBroker

Specifying a Connection Using Sockets

4.1.8.4.2 TSocketConnection.Host Property

Specifies the host name of the server.

Pascal

```
property Host: string;
```

C++

```
__property UnicodeString Host;
```

Description

Use Host to specify the host name of the server system to which the client application should connect. In addition to the host name, you must provide a value for the Port (see page 228) property so that the socket connection component can locate the listening socket on the server system.

Sockets (see page 1367) require either a Host name or an IP address to locate the server system. You can use the Address (see page 225) property instead of the Host property to specify the server system using an IP address. The Host and Address (see page 225) properties are mutually exclusive: Setting Host causes Address (see page 225) to be set to an empty string, and vice versa.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Host property. Instead, the Object Broker supplies a host name for a server that is located dynamically at runtime. Explicitly setting the Host property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection component.

See Also

Address (see page 225)

Port (see page 228)

ObjectBroker

Specifying a Connection Using Sockets

4.1.8.4.3 TSocketConnection.InterceptGUID Property

Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptGUID: string;
```

C++

```
__property UnicodeString InterceptGUID;
```

Description

Set InterceptGUID to the GUID of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

The COM object must implement the IDataIntercept interface. Use the IDataIntercept methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a ProgID instead of a GUID, use the InterceptName property

instead.

Note: When using InterceptGUID, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptGUID. For servers that respond to TSocketConnection, you can set the server's InterceptGUID to the same GUID using the Socket server dialog of ScktSrvr.exe.

See Also

IDataIntercept (see page 274)

InterceptName (see page 247)

GetInterceptorList (see page 241)

Specifying a Connection Using Sockets

4.1.8.4.4 TSocketConnection.InterceptName Property

Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptName: string;
```

C++

```
__property UnicodeString InterceptName;
```

Description

Set InterceptName to the programmatic ID (ProgID) of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

Note: In Delphi, you can choose the ProgID of any COM objects that have been registered to perform this task at Design time, using a drop-down list in the Object Inspector, if they use TPacketInterceptFactory as a class factory.

The COM object must implement the IDataIntercept interface. Use the IDataIntercept methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a GUID instead of a ProgID, use the InterceptGUID property instead.

Note: When using InterceptName, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptName. For servers that respond to TSocketConnection, you can set the COM object that the server uses with the Socket server dialog of ScktSrvr.exe.

IDataIntercept (see page 274)

InterceptGUID (see page 246)

GetInterceptorList (see page 241)

TPacketInterceptFactory (see page 219)

Specifying a Connection Using Sockets

4.1.8.4.5 TSocketConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker;
```

C++

```
__property ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

Using TSimpleObjectBroker

4.1.8.4.6 TSocketConnection.Port Property

Specifies the port number of the socket dispatcher application on the server system.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Use Port to specify the port that the socket dispatcher uses to listen for client connection requests. By default, Port is 211, which is the default port number of ScktSrvr.exe (the socket dispatcher application). Change the value of Port if the socket dispatcher is configured to use a different port.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Port property. Instead, the Object Broker supplies a port number for a server that is located dynamically at runtime. Explicitly setting the Port property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection

component.

See Also

Address (see page 225)

Host (see page 226)

ObjectBroker

Specifying a Connection Using Sockets

4.1.8.4.7 TSocketConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection, callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

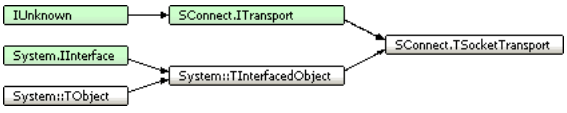
4.1.9 TSocketTransport Class

Class Hierarchy



Pascal

```
TSocketTransport = class(TInterfacedObject, ITransport);
```

C++

```
class TSocketTransport : public TInterfacedObject, public ITransport;
```

File

SConnect

Description

This is class SConnect.TSocketTransport.

4.1.9.1 TSocketTransport Members

The following tables list the members exposed by TSocketTransport.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetConnected (see page 232)	Returns the value of the Connected property.
	GetWaitEvent (see page 233)	Returns the handle for an event object that is managed by the object that implements ITransport.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	Receive (see page 233)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 234)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 234)	Sets the value of the Connected property.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 231)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 231)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.

	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Address (see page 234)	This is Address, a member of class TSocketTransport.
	Connected (see page 281)	Indicates whether the connection to the application server is established.
	Host (see page 235)	This is Host, a member of class TSocketTransport.
	InterceptGUID (see page 235)	This is InterceptGUID, a member of class TSocketTransport.
	Port (see page 235)	This is Port, a member of class TSocketTransport.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Socket (see page 235)	This is Socket, a member of class TSocketTransport.

4.1.9.2 TSocketTransport.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TSocketTransport();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

4.1.9.3 TSocketTransport.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSocketTransport();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

4.1.9.4 TSocketTransport Methods

The methods of the TSocketTransport class are listed here.

Protected Methods

	Name	Description
	GetConnected (see page 232)	Returns the value of the Connected property.
	GetWaitEvent (see page 233)	Returns the handle for an event object that is managed by the object that implements ITransport.
	Receive (see page 233)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 234)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 234)	Sets the value of the Connected property.

4.1.9.4.1 TSocketTransport.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean GetConnected();
```

Description

GetConnected is the read property implementer for the Connected property.

See Also

Connected (see page 281)

4.1.9.4.2 TSocketTransport.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport.

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport.

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport, create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 3133)

4.1.9.4.3 TSocketTransport.Receive Method

Returns an IDataBlock interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport. Its value is the return value of the Send method.

See Also

Memory (see page 272)

Send (see page 280)

4.1.9.4.4 TSocketTransport.Send Method

Sends information retrieved from an IDataBlock interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 272)

Receive (see page 280)

4.1.9.4.5 TSocketTransport.SetConnected Method

Sets the value of the Connected property.

Pascal

```
procedure SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall SetConnected(Boolean Value);
```

Description

SetConnected is the write implementer for the Connected property.

4.1.9.5 TSocketTransport Properties

The properties of the TSocketTransport class are listed here.

Public Properties

	Name	Description
	Address (see page 234)	This is Address, a member of class TSocketTransport.
	Host (see page 235)	This is Host, a member of class TSocketTransport.
	InterceptGUID (see page 235)	This is InterceptGUID, a member of class TSocketTransport.
	Port (see page 235)	This is Port, a member of class TSocketTransport.
	Socket (see page 235)	This is Socket, a member of class TSocketTransport.

4.1.9.5.1 TSocketTransport.Address Property

Pascal

```
property Address: string;
```

C++

```
__property UnicodeString Address;
```

Description

This is Address, a member of class TSocketTransport.

4.1.9.5.2 TSocketTransport.Host Property

Pascal

```
property Host: string;
```

C++

```
__property UnicodeString Host;
```

Description

This is Host, a member of class TSocketTransport.

4.1.9.5.3 TSocketTransport.InterceptGUID Property

Pascal

```
property InterceptGUID: string;
```

C++

```
__property UnicodeString InterceptGUID;
```

Description

This is InterceptGUID, a member of class TSocketTransport.

4.1.9.5.4 TSocketTransport.Port Property

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

This is Port, a member of class TSocketTransport.

4.1.9.5.5 TSocketTransport.Socket Property

Pascal

```
property Socket: TCustomWinSocket;
```

C++

```
__property TCustomWinSocket Socket;
```

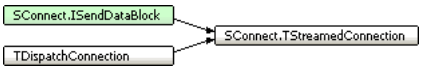
Description

This is Socket, a member of class TSocketTransport.

4.1.10 TStreamedConnection Class

TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.

Class Hierarchy



Pascal

```
TStreamedConnection = class(TDispatchConnection, ISendDataBlock);
```

C++

```
class TStreamedConnection : public TDispatchConnection, public ISendDataBlock;
```

File

SConnect

Description

Do not create instances of TStreamedConnection. Instead, instantiate a descendant of TStreamedConnection such as TSocketConnection (see page 221) or TWebConnection (see page 254).

TStreamedConnection handles the marshaling of all COM data types so that the streamed connection component can generate, interpret, and respond to remote COM interface calls without using DCOM. It uses an ITransport (see page 278) interface to connect to application servers and to send and receive messages.

TStreamedConnection can't actually connect to or communicate with an application server. Descendants of TStreamedConnection override the CreateTransport (see page 239) method to obtain an ITransport (see page 278) interface that enables these behaviors.

TStreamedConnection implements the ISendDataBlock (see page 276) interface.

IAppServer

4.1.10.1 TStreamedConnection Members

The following tables list the members exposed by TStreamedConnection.

Protected Methods

	Name	Description
	_AddRef (see page 239)	Increments an internal reference counter.
	_Release (see page 239)	Decrements an internal reference counter.
V	CreateTransport (see page 239)	Provides the backstop for a method that obtains an ITransport (see page 278) interface.
V	DoConnect (see page 240)	Connects to an application server.
V	DoDisconnect (see page 240)	Disconnects from an application server.
V	DoError (see page 241)	raises an exception for a specified exception object.
V	GetInterpreter (see page 242)	Returns the value of the Interpreter (see page 247) property.
V	InternalClose (see page 242)	Terminates a connection to the application server.
V	InternalOpen (see page 243)	Opens a connection to the application server.
	QueryInterface (see page 243)	Implements the IUnknown (see page 3756) QueryInterface method.
	Send (see page 244)	Sends an interface call to the application server and returns the response.
	ThreadException (see page 244)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 244)	Handles callbacks from the application server.
	WndProc (see page 245)	Dispatches messages from the transport layer.

Protected Properties

	Name	Description
R	Handle (see page 246)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 246)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 247)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 247)	Provides access to the helper object that marshals interface calls for the streamed connection.
	SupportCallbacks (see page 248)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Public Methods

	Name	Description
V	Create (see page 237)	Creates and initializes an instance of TStreamedConnection (see page 236).
V	Destroy (see page 238)	Disposes of a TStreamedConnection (see page 236) instance.
V	GetInterceptorList (see page 241)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
V	GetServerList (see page 242)	Retrieves a list of registered data brokers from the remote server system.

4.1.10.2 TStreamedConnection.Create Constructor

Creates and initializes an instance of TStreamedConnection (see page 236).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TStreamedConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a streamed connection component at runtime. Connection components placed in forms or data modules at design time are instantiated automatically.

After calling the inherited constructor, Create instantiates the data block interpreter accessed by the Interpreter (see page 247) property.

See Also

Interpreter (see page 247)

Create

4.1.10.3 TStreamedConnection.Destroy Destructor

Disposes of a TStreamedConnection (see page 236) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStreamedConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the streamed connection is not nil, and only then calls Destroy.

Destroy ensures that the connection to the server is closed. It then frees all resources and helper objects before calling the inherited destructor.

See Also

System::TObject::Free (see page 3372)

4.1.10.4 TStreamedConnection Methods

The methods of the TStreamedConnection class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 239)	Increments an internal reference counter.
	_Release (see page 239)	Decrements an internal reference counter.
V	CreateTransport (see page 239)	Provides the backstop for a method that obtains an ITransport (see page 278) interface.
V	DoConnect (see page 240)	Connects to an application server.
V	DoDisconnect (see page 240)	Disconnects from an application server.
V	DoError (see page 241)	raises an exception for a specified exception object.
V	GetInterpreter (see page 242)	Returns the value of the Interpreter (see page 247) property.
V	InternalClose (see page 242)	Terminates a connection to the application server.
V	InternalOpen (see page 243)	Opens a connection to the application server.
	QueryInterface (see page 243)	Implements the IUnknown (see page 3756) QueryInterface method.
	Send (see page 244)	Sends an interface call to the application server and returns the response.
	ThreadException (see page 244)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 244)	Handles callbacks from the application server.
	WndProc (see page 245)	Dispatches messages from the transport layer.

Public Methods

	Name	Description
V	GetInterceptorList (see page 241)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
V	GetServerList (see page 242)	Retrieves a list of registered data brokers from the remote server system.

4.1.10.4.1 TStreamedConnection._AddRef Method

Increments an internal reference counter.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef implements the IUnknown (see page 3756) interface method, _AddRef, by incrementing an internal reference counter. The reference count is decreased by calling _Release (see page 239).

See Also

_Release (see page 239)

QueryInterface (see page 243)

4.1.10.4.2 TStreamedConnection._Release Method

Decrements an internal reference counter.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release implements the IUnknown (see page 3756) interface method, _Release, by decrementing an internal reference counter. The reference count is increased by calling _AddRef (see page 239)

See Also

_AddRef (see page 239)

QueryInterface (see page 243)

4.1.10.4.3 TStreamedConnection.CreateTransport Method

Provides the backstop for a method that obtains an ITransport (see page 278) interface.

Pascal

```
function CreateTransport: ITransport; virtual;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Streamed connection components use an ITransport (see page 278) interface to connect to and communicate with the application server. As implemented in TStreamedConnection (see page 236), CreateTransport always returns nil (Delphi) or NULL (C++).

Descendants of TStreamedConnection (see page 236) override CreateTransport to obtain an ITransport (see page 278)

interface that connects to and communicates with the application server.

Component writers wanting to create connection components for specialized transport protocols need only override CreateTransport. Once the streamed connection has a working ITransport (see page 278) interface, all other functions of the connection component are handled automatically.

See Also

Send (see page 244)

DoConnect (see page 240)

DoDisconnect (see page 240)

ThreadReceivedStream (see page 244)

4.1.10.4.4 TStreamedConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected property is set to true. DoConnect creates a separate thread for managing the connection so that communication with the application server does not block execution in the client application. Using the ITransport (see page 278) interface, DoConnect connects to the application server and sets the value of the AppServer property to its interface.

Note: Descendants of TStreamedConnection (see page 236) override CreateTransport (see page 239) rather than DoConnect to change the way the client application forms a connection to application servers.

See Also

AfterConnect

BeforeConnect

Connected

AppServer

CreateTransport (see page 239)

4.1.10.4.5 TStreamedConnection.DoDisconnect Method

Disconnects from an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected property is set to false. Using the ITransport (see page 278) interface,

DoDisconnect drops the connection to the application server.

See Also

Connected

CreateTransport (see page 239)

4.1.10.4.6 TStreamedConnection.DoError Method

raises an exception for a specified exception object.

Pascal

```
procedure DoError(E: Exception); virtual;
```

C++

```
virtual __fastcall DoError(Exception E);
```

Description

TStreamedConnection (see page 236) uses a separate thread when making interface calls to the application server. When that thread encounters an exception, it sends a message to the Window handle specified by the Handle (see page 246) property. The connection component uses DoError to raise those exceptions.

Note: DoError is called by the ThreadException (see page 244) method, which is the message handler for thread exceptions. It is also called when thread exception messages are taken from the message queue before they are received by the internal window procedure.

See Also

ThreadException (see page 244)

Handle (see page 246)

EInterpreterError (see page 191)

4.1.10.4.7 TStreamedConnection.GetInterceptorList Method

Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.

Pascal

```
function GetInterceptorList: OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant GetInterceptorList();
```

Description

Call GetInterceptorList to obtain a list of ProgIDs that can be assigned to the InterceptName (see page 247) property. GetInterceptorList retrieves a list of all COM objects that have been registered by TPacketInterceptFactory (see page 219) as data packet interceptors (objects that support the IDataIntercept (see page 274) interface that can be used to intercept and transform messages passed between a connection component and an application server.)

GetInterceptorList returns a Variant (see page 3421) array of strings. Any of these strings can be used as a valid setting for the InterceptName (see page 247) property.

At design time, TStreamedConnection (see page 236) uses the GetInterceptorList method to populate the InterceptName (see page 247) drop-down in the Object Inspector.

See Also

IDataIntercept (see page 274)

InterceptName (see page 247)

InterceptGUID (see page 246)

TPacketInterceptFactory (see page 219)

4.1.10.4.8 TStreamedConnection.GetInterpreter Method

Returns the value of the Interpreter (see page 247) property.

Pascal

```
function GetInterpreter: TCustomDataBlockInterpreter; virtual;
```

C++

```
virtual __fastcall TCustomDataBlockInterpreter GetInterpreter();
```

Description

GetInterpreter is the protected read implementation of the Interpreter (see page 247) property. As implemented in TStreamedConnection (see page 236), GetInterpreter instantiates a TDataBlockInterpreter (see page 207) object.

See Also

Interpreter (see page 247)

TDataBlockInterpreter (see page 207)

4.1.10.4.9 TStreamedConnection.GetServerList Method

Retrieves a list of registered data brokers from the remote server system.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Call GetServerList to obtain a list of servers that are registered on the system to which the streamed connection communicates. GetServerList returns a Variant (see page 3421) array of strings. Any of these strings can be used as a valid setting for the ServerName property.

At design time, TStreamedConnection (see page 236) uses the GetServerList method to populate the ServerName drop-down in the Object Inspector. Note that, unlike COM-based connection components (which populate that list with servers that are registered on the client machine), this results in a list of application servers that are registered on the server machine.

See Also

ServerName

4.1.10.4.10 TStreamedConnection.InternalClose Method

Terminates a connection to the application server.

Pascal

```
procedure InternalClose; virtual;
```

C++

```
virtual __fastcall InternalClose();
```

Description

Streamed connection components use InternalClose to handle the details of closing a connection to the application server. This method is called by the DoDisconnect (see page 240) method (which implements the Connected property) and at other times when the connection component must terminate a connection.

See Also

Connected

DoDisconnect (see page 240)

4.1.10.4.11 TStreamedConnection.InternalOpen Method

Opens a connection to the application server.

Pascal

```
procedure InternalOpen; virtual;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

Streamed connection components use InternalOpen to handle the details of establishing a connection to the application server. This method is called by the DoConnect (see page 240) method (which implements the Connected property) and at other times when the connection component must establish a connection.

See Also

Connected

DoConnect (see page 240)

4.1.10.4.12 TStreamedConnection.QueryInterface Method

Implements the IUnknown (see page 3756) QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall; reintroduce;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface returns a reference to the interface specified by the IID parameter as the Obj parameter. It the streamed connection supports the specified interface, QueryInterface returns 0. If the streamed connection does not support the interface, the Obj parameter is nil (Delphi) or NULL (C++) and QueryInterface returns E_NOINTERFACE (see page 3845).

See Also

_AddRef (see page 239)

ISendDataBlock (see page 276)

4.1.10.4.13 TStreamedConnection.Send Method

Sends an interface call to the application server and returns the response.

Pascal

```
function Send(const Data: IDataBlock; WaitForResult: Boolean): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Send(const IDataBlock Data, Boolean WaitForResult);
```

Description

The data block interpreter (specified by the Interpreter (see page 247) property) calls Send to dispatch interface messages to the application server. It supplies an IDataBlock (see page 266) interface that encapsulates the interface from the application server.

Communication with the application server occurs on a separate thread. The WaitForResult parameter indicates whether execution on the main thread should halt until the interface call returns a result (WaitForResult == true), or whether the interface call can occur asynchronously (WaitForResult == false). If WaitForResult is true, Send returns an IDataBlock (see page 266) interface (_di_IDataBlock in C++) that supplies the result.

See Also

Interpreter (see page 247)

ThreadReceivedStream (see page 244)

4.1.10.4.14 TStreamedConnection.ThreadException Method

raises an exception for the thread that communicates with the application server.

Pascal

```
procedure ThreadException(var Message: TMessage); message THREAD_EXCEPTION;
```

C++

```
__fastcall ThreadException(TMessage Message);
```

Description

TStreamedConnection (see page 236) uses a separate thread when making interface calls to the application server. When that thread encounters an exception, it sends a message to the Window handle specified by the Handle (see page 246) property. ThreadException is the message handler for that Windows message. It raises an exception in the main execution thread.

See Also

Handle (see page 246)

4.1.10.4.15 TStreamedConnection.ThreadReceivedStream Method

Handles callbacks from the application server.

Pascal

```
procedure ThreadReceivedStream(var Message: TMessage); message THREAD_RECEIVEDSTREAM;
```

C++

```
__fastcall ThreadReceivedStream(TMessage Message);
```

Description

TStreamedConnection (see page 236) uses a separate thread for interface calls to and from the application server. When the application server calls a client application interface, that thread sends a message to the Window handle specified by the Handle (see page 246) property. ThreadReceivedStream is the message handler for the Windows message from the application server.

ThreadReceivedStream passes the interface call to the data block interpreter specified by the Interpreter (see page 247) property.

See Also

Handle (see page 246)

Interpreter (see page 247)

4.1.10.4.16 TStreamedConnection.WndProc Method

Dispatches messages from the transport layer.

Pascal

```
procedure WndProc(var Message: TMessage);
```

C++

```
__fastcall WndProc(TMessage Message);
```

Description

TStreamedConnection (see page 236) uses a separate thread for interface calls to and from the application server. That thread communicates with the streamed connection component by sending Windows messages to the handle specified by the Handle (see page 246) property. WndProc is the window procedure associated with that Window handle. It dispatches any messages that have message handlers such as ThreadException (see page 244) or ThreadReceivedStream (see page 244). All other messages are ignored.

See Also

Handle (see page 246)

ThreadException (see page 244)

ThreadReceivedStream (see page 244)

4.1.10.5 TStreamedConnection Properties

The properties of the TStreamedConnection class are listed here.

Protected Properties

	Name	Description
R	Handle (see page 246)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 246)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 247)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 247)	Provides access to the helper object that marshals interface calls for the streamed connection.
	SupportCallbacks (see page 248)	Determines whether the streamed connection component can handle callbacks in the application server interface.

4.1.10.5.1 TStreamedConnection.Handle Property

Provides access to an internal window handle that can receive messages from the transport layer.

Pascal

```
property Handle: THandle;
```

C++

```
__property THandle Handle;
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received.

The internal thread that handles these communication tasks uses Windows messages to coordinate events. TStreamedConnection (see page 236) uses the Handle property to provide this internal thread with a window handle that it can use.

See Also

WndProc (see page 245)

ThreadReceivedStream (see page 244)

ThreadException (see page 244)

4.1.10.5.2 TStreamedConnection.InterceptGUID Property

Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptGUID: string;
```

C++

```
__property UnicodeString InterceptGUID;
```

Description

Set InterceptGUID to the GUID of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

The COM object must implement the IDataIntercept (see page 274) interface. Use the IDataIntercept (see page 274) methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a ProgID instead of a GUID, use the InterceptName (see page 247) property instead.

Note: When using InterceptGUID, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptGUID. For servers that respond to TSocketConnection (see page 221), you can set the server's InterceptGUID to the same GUID using the Socket server dialog of ScktSrvr.exe.

See Also

IDataIntercept (see page 274)

InterceptName (see page 247)

GetInterceptorList (see page 241)

Specifying a Connection Using Sockets

4.1.10.5.3 TStreamedConnection.InterceptName Property

Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptName: string;
```

C++

```
__property UnicodeString InterceptName;
```

Description

Set InterceptName to the programmatic ID (ProgID) of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

Note: In Delphi, you can choose the ProgID of any COM objects that have been registered to perform this task at Design time, using a drop-down list in the Object Inspector, if they use TPacketInterceptFactory (see page 219) as a class factory.

The COM object must implement the IDataIntercept (see page 274) interface. Use the IDataIntercept (see page 274) methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a GUID instead of a ProgID, use the InterceptGUID (see page 246) property instead.

Note: When using InterceptName, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptName. For servers that respond to TSocketConnection (see page 221), you can set the COM object that the server uses with the Socket server dialog of ScktSrvr.exe.

See Also

IDataIntercept (see page 274)

InterceptGUID (see page 246)

GetInterceptorList (see page 241)

TPacketInterceptFactory (see page 219)

Specifying a Connection Using Sockets

4.1.10.5.4 TStreamedConnection.Interpreter Property

Provides access to the helper object that marshals interface calls for the streamed connection.

Pascal

```
property Interpreter: TCustomDataBlockInterpreter;
```

C++

```
__property TCustomDataBlockInterpreter Interpreter;
```

Description

Streamed connection components use a data block interpreter internally to provide marshaling support.

See Also

Send (see page 244)

4.1.10.5.5 TStreamedConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection (see page 221), callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection (see page 254) can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

Send (see page 244)

Extending the Interface of the Application Server

4.1.11 TTransportThread Class

Class Hierarchy

Pascal

```
TTransportThread = class(TThread);
```

C++

```
class TTransportThread : public TThread;
```

File

SConnect

Description

This is class SConnect.TTransportThread.

4.1.11.1 TTransportThread Members

The following tables list the members exposed by TTransportThread.

Public Methods

	Name	Description
	Create (see page 249)	This is Create, a member of class TTransportThread.
	Destroy (see page 249)	Destroys the thread object and releases the memory allocated to it.
	Execute (see page 250)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Public Properties

	Name	Description
	Semaphore (see page 254)	This is Semaphore, a member of class TTransportThread.

4.1.11.2 TTransportThread.Create Constructor

Pascal

```
constructor Create(AHandle: THandle; Transport: ITransport); virtual;
```

C++

```
virtual __fastcall TTransportThread(THandle AHandle, ITransport Transport);
```

Description

This is Create, a member of class TTransportThread.

4.1.11.3 TTransportThread.Destroy Destructor

Destroys the thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTransportThread();
```

Description

Do not call Destroy in an application. Instead, use Free to destroy a thread when FreeOnTerminate is False.

Destroy signals the thread to terminate and then waits for the thread to return before calling the inherited Destroy method.

See Also

Create

Terminate

WaitFor

FreeOnTerminate

System::TObject::Free (see page 3372)

4.1.11.4 TTransportThread Methods

The methods of the TTransportThread class are listed here.

Public Methods

	Name	Description
	Execute (see page 250)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

4.1.11.4.1 TTransportThread.Execute Method

Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Override Execute and insert the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

A thread executes when Create is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

C++ Examples:

```
/*
This example shows how to create a thread and start it
running at a lower priority than the main execution thread.
Set the thread's FreeOnTerminate property is True, so that
there is no need to free the thread when it finishes. To
create the extension choose the
File | New | Other | Thread Object menu.
*/
bool mythreadRunning;
bool youthreadRunning;

class TMyThread : public TThread
{

{
  Form1->Memo3->Lines->Add("Second low priority process has been running for this many
seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo3->Lines->Add("Second low priority process " + IntToStr(I));
    Sleep(1000);
  }
  youthreadRunning = FALSE;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMyThread *SecondProcess; // TMyThread is a custom descendant of TThread
  if (mythreadRunning == FALSE)
  {
    mythreadRunning = TRUE;
    SecondProcess = new TMyThread(True); // create suspended - secondprocess does not run yet
    SecondProcess->FreeOnTerminate = True; // don't need to cleanup after terminate
    SecondProcess->Priority = tpLower;  // set the priority to lower than normal
    SecondProcess->Resume(); // now run the thread
  }
  else
    MessageDlg("This thread is still running.  You are going to hurt yourself!",
      mtInformation, TMsgDlgButtons() << mbOK, 0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form1->Memo2->Lines->Add("Do some work in the main process for 10 seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo2->Lines->Add("Main process " + IntToStr(I));
    Sleep(1000);
  }
}

void __fastcall TForm1::Button3Click(TObject *Sender)
```

```
{
  TYouThread *SecondProcess; // TMyThread is a custom descendant of TThread
  if (youthreadRunning == FALSE)
  {
    youthreadRunning = TRUE;
    SecondProcess = new TYouThread(True); // create suspended – secondprocess does not run yet
    SecondProcess->FreeOnTerminate = True; // don't need to cleanup after terminate
    SecondProcess->Priority = tpLower;  // set the priority to lower than normal
    SecondProcess->Resume(); // now run the thread
  }
  else
    MessageDlg("This thread is still running.  You are going to hurt yourself!",
      mtInformation, TMsgDlgButtons() << mbOK, 0);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  mythreadRunning = FALSE;
  youthreadRunning = FALSE;
}
```

Delphi Examples:

```
{
This example shows how to create a thread and start it
running at a lower priority than the main execution thread.
Set the thread's FreeOnTerminate property is True, so that
there is no need to free the thread when it finishes.  The
Execute procedure must be overridden in the extension class
of TThread or an "Abstract Error" will result. To create the
extension choose the File | New | Other | Thread Object menu.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if (mythreadRunning = FALSE) then
  begin
    mythreadRunning:= TRUE;
    MyProcess := TMyThread.Create(True); { create suspended - secondprocess does not run yet }
    MyProcess.FreeOnTerminate := True; { don't need to cleanup after terminate }
    MyProcess.Priority := tpLower;  // set the priority to lower than normal
    MyProcess.Resume; { now run the thread }
  end
  else
    MessageDlg('This thread is still running.  You are going to hurt yourself!',
      mtInformation, [mbOk], 0);

4.1.11.5 TTransportThread Properties

The properties of the TTransportThread class are listed here.

Public Properties

	Name	Description
	Semaphore (see page 254)	This is Semaphore, a member of class TTransportThread.

4.1.11.5.1 TTransportThread.Semaphore Property

Pascal

```
property Semaphore: THandle;
```

C++

```
__property THandle Semaphore;
```

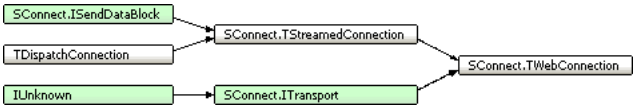
Description

This is Semaphore, a member of class TTransportThread.

4.1.12 TWebConnection Class

TWebConnection uses HTTP to manage the connection to an application server.

Class Hierarchy



Pascal

```
TWebConnection = class(TStreamedConnection, ITransport);
```

C++

```
class TWebConnection : public TStreamedConnection, public ITransport;
```

File

SConnect

Description

TWebConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The Web connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TWebConnection establishes the initial connection between the client application and a remote application server using HTTP. To use TWebConnection, you must have the following:

Wininet.dll must be installed on the client system. Wininet.dll is found in the Windows system directory if you have IE3 or higher installed.

The server system must have IIS version 4 or better or Netscape Enterprise version 3.6 or better.

HTTPsrvr.dll must be installed with the Web server to which TWebConnection forms a connection. HTTPsrvr.dll launches the application server and marshals all calls to the application server interface.

Once the connection is established, the client registers any or all of its client datasets, and these client datasets use the IAppServer interface from the Web connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection component instead. To connect to remote application servers using TCP/IP, use the TSocketConnection (see page 221) component instead. To connect to remote application servers using SOAP, use the TSoapConnection component.

4.1.12.1 TWebConnection Members

The following tables list the members exposed by TWebConnection.

Protected Methods

	Name	Description
	_AddRef (see page 239)	Increments an internal reference counter.
	_Release (see page 239)	Decrements an internal reference counter.
V	CreateTransport (see page 257)	Provides the backstop for a method that obtains an ITransport interface.
V	DoConnect (see page 258)	Connects to an application server.
V	DoDisconnect (see page 240)	Disconnects from an application server.
V	DoError (see page 241)	raises an exception for a specified exception object.
V	GetInterpreter (see page 258)	Returns the value of the Interpreter property.
	GetWaitEvent (see page 259)	Returns the handle for an event object that is managed by the object that implements ITransport.
V	InternalClose (see page 242)	Terminates a connection to the application server.
V	InternalOpen (see page 243)	Opens a connection to the application server.
	QueryInterface (see page 243)	Implements the IUnknown (see page 3756) QueryInterface method.
	Receive (see page 259)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 260)	Sends information retrieved from an IDataBlock interface to the application server.
V	SetConnected (see page 260)	Sets the Connected property.
	ThreadException (see page 244)	raises an exception for the thread that communicates with the application server.

	ThreadReceivedStream (see page 244)	Handles callbacks from the application server.
	Transport_GetConnected (see page 261)	This is Transport_GetConnected, a member of class TWebConnection.
	Transport_SetConnected (see page 261)	This is Transport_SetConnected, a member of class TWebConnection.
	WndProc (see page 245)	Dispatches messages from the transport layer.

Protected Properties

	Name	Description
R	Handle (see page 246)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 246)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 247)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 247)	Provides access to the helper object that marshals interface calls for the streamed connection.
	SupportCallbacks (see page 264)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Public Methods

	Name	Description
V	Create (see page 256)	Creates and initializes an instance of TWebConnection (see page 254).
V	Destroy (see page 257)	Destroys an instance of TWebConnection (see page 254).
	GetConnected (see page 279)	Returns the value of the Connected (see page 281) property.
V	GetInterceptorList (see page 241)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
V	GetServerList (see page 242)	Retrieves a list of registered data brokers from the remote server system.

Public Properties

	Name	Description
	Connected (see page 281)	Indicates whether the connection to the application server is established.

Published Properties

	Name	Description
	Agent (see page 262)	Provides the value of the User-Agent header for HTTP messages to the server.
	ObjectBroker (see page 262)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Password (see page 263)	Specifies the password that allows the client application to log on to the application server.
	Proxy (see page 263)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 263)	Lists the host names of locally registered servers that do not require a proxy.
	URL (see page 264)	Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.
	UserName (see page 265)	Specifies the user name that allows the client application to log on to the application server.

4.1.12.2 TWebConnection.Create Constructor

Creates and initializes an instance of TWebConnection (see page 254).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebConnection (see page 254) object at runtime. Web connection components added to forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually a form or data module) that is responsible for freeing the Web connection component.

See Also

Create (see page 237)

Owner

4.1.12.3 TWebConnection.Destroy Destructor

Destroys an instance of TWebConnection (see page 254).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebConnection();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the Web connection is not nil before calling Destroy.

4.1.12.4 TWebConnection Methods

The methods of the TWebConnection class are listed here.

Protected Methods

	Name	Description
	CreateTransport (see page 257)	Provides the backstop for a method that obtains an ITransport interface.
	DoConnect (see page 258)	Connects to an application server.
	GetInterpreter (see page 258)	Returns the value of the Interpreter property.
	GetWaitEvent (see page 259)	Returns the handle for an event object that is managed by the object that implements ITransport.
	Receive (see page 259)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 260)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 260)	Sets the Connected property.
	Transport_GetConnected (see page 261)	This is Transport_GetConnected, a member of class TWebConnection.
	Transport_SetConnected (see page 261)	This is Transport_SetConnected, a member of class TWebConnection.

4.1.12.4.1 TWebConnection.CreateTransport Method

Provides the backstop for a method that obtains an ITransport interface.

Pascal

```
function CreateTransport: ITransport; override;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Streamed connection components use an ITransport interface to connect to and communicate with the application server. As implemented in TStreamedConnection, CreateTransport always returns nil (Delphi) or NULL (C++).

Descendants of TStreamedConnection override CreateTransport to obtain an ITransport interface that connects to and communicates with the application server.

Component writers wanting to create connection components for specialized transport protocols need only override CreateTransport. Once the streamed connection has a working ITransport interface, all other functions of the connection component are handled automatically.

See Also

Send (see page 244)

DoConnect (see page 240)

DoDisconnect (see page 240)

ThreadReceivedStream (see page 244)

4.1.12.4.2 TWebConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected property is set to true. DoConnect creates a separate thread for managing the connection so that communication with the application server does not block execution in the client application. Using the ITransport interface, DoConnect connects to the application server and sets the value of the AppServer property to its interface.

Note: Descendants of TStreamedConnection override CreateTransport rather than DoConnect to change the way the client application forms a connection to application servers.

See Also

AfterConnect

BeforeConnect

Connected

AppServer

CreateTransport (see page 239)

4.1.12.4.3 TWebConnection.GetInterpreter Method

Returns the value of the Interpreter property.

Pascal

```
function GetInterpreter: TCustomDataBlockInterpreter; override;
```

C++

```
virtual __fastcall TCustomDataBlockInterpreter GetInterpreter();
```

Description

GetInterpreter is the protected read implementation of the Interpreter property. As implemented in TStreamedConnection,

GetInterpreter instantiates a TDataBlockInterpreter object.

See Also

Interpreter (see page 247)

TDataBlockInterpreter (see page 207)

4.1.12.4.4 TWebConnection.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport.

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport.

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport, create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 3133)

4.1.12.4.5 TWebConnection.Receive Method

Returns an IDataBlock interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport. Its value is the return value of the Send method.

See Also

Memory (see page 272)

Send (see page 280)

4.1.12.4.6 TWebConnection.Send Method

Sends information retrieved from an IDataBlock interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 272)

Receive (see page 280)

4.1.12.4.7 TWebConnection.SetConnected Method

Sets the Connected property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected property. It establishes a connection to the Application server if Value is true, and disconnects from the application server if Value is false.

If Value is false, SetConnected generates a BeforeDisconnect event, closes the connection, and generates an AfterDisconnect event.

If Value is true, SetConnected performs the following actions:

1. If LoginPrompt is true, and the connection is not already open, SetConnected generates an OnGetUsername event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
2. It generates a BeforeConnect event.
3. It opens the connection.
4. It generates an AfterConnect event.
5. If LoginPrompt is true, and the connection opened successfully, SetConnected generates an OnLogin event.

See Also

OnGetUsername

OnLogin

4.1.12.4.8 TWebConnection.Transport_GetConnected Method

Pascal

```
function Transport_GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean Transport_GetConnected();
```

Description

This is Transport_GetConnected, a member of class TWebConnection.

4.1.12.4.9 TWebConnection.Transport_SetConnected Method

Pascal

```
procedure Transport_SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall Transport_SetConnected(Boolean Value);
```

Description

This is Transport_SetConnected, a member of class TWebConnection.

4.1.12.5 TWebConnection Properties

The properties of the TWebConnection class are listed here.

Protected Properties

	Name	Description
	SupportCallbacks (see page 264)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Published Properties

	Name	Description
	Agent (see page 262)	Provides the value of the User-Agent header for HTTP messages to the server.
	ObjectBroker (see page 262)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Password (see page 263)	Specifies the password that allows the client application to log on to the application server.
	Proxy (see page 263)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 263)	Lists the host names of locally registered servers that do not require a proxy.
	URL (see page 264)	Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.
	UserName (see page 265)	Specifies the user name that allows the client application to log on to the application server.

4.1.12.5.1 TWebConnection.Agent Property

Provides the value of the User-Agent header for HTTP messages to the server.

Pascal

```
property Agent: string;
```

C++

```
__property UnicodeString Agent;
```

Description

Use Agent to supply HTTP messages generated by the Web connection component with the name of your application. This name is included as a User-Agent header. The User-Agent header is an optional string that describes the application generating the HTTP message.

See Also

Title

4.1.12.5.2 TWebConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker;
```

C++

```
__property ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

Using TSimpleObjectBroker

4.1.12.5.3 TWebConnection.Password Property

Specifies the password that allows the client application to log on to the application server.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

When the Web connection component connects to the application server, it supplies the values of the UserName (see page 265) and Password properties so that it can log on to the host or proxy. The value of Password can be an empty string if neither the host nor proxy requires authentication.

See Also

UserName (see page 265)

Specifying a Connection Using HTTP

4.1.12.5.4 TWebConnection.Proxy Property

Lists any proxy servers that are required to make the connection.

Pascal

```
property Proxy: string;
```

C++

```
__property UnicodeString Proxy;
```

Description

Use Proxy if the Web connection component can't resolve the value of Host locally. If the server is registered locally, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

ProxyByPass (see page 263)

4.1.12.5.5 TWebConnection.ProxyByPass Property

Lists the host names of locally registered servers that do not require a proxy.

Pascal

```
property ProxyByPass: string;
```

C++

```
__property UnicodeString ProxyByPass;
```

Description

Use ProxyByPass to indicate any server systems to which the Web connection component can make a direct connection. When the Host property specifies a server in this list, the Web connection component makes a direct connection even if the Proxy (see page 263) property is specified.

When ProxyByPass is an empty string, the Web connection component checks the registry for any locally known servers and

bypasses the proxy server if Host refers to a registered local server.

See Also

Proxy (see page 263)

4.1.12.5.6 TWebConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection, callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

See Also

Send (see page 244)

Extending the Interface of the Application Server

4.1.12.5.7 TWebConnection.URL Property

Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.

Pascal

```
property URL: string;
```

C++

```
__property UnicodeString URL;
```

Description

Use URL to specify the Uniform Resource Locator that the Web connection component uses to locate httpsrvr.dll. This DLL, which ships in the BIN directory, is deployed on the same machine as the Web server so that it can accept HTTP request messages and convert them into COM calls that communicate with the application server.

URL includes the protocol (http or https), host name, and scriptname for httpsrvr.dll. Typically, it has the form

`http://DataHost.org/scripts/httpsrvr.dll`

Note: URL is a standard Uniform Resource Locator. As such, you can also use it to override the port associated with http (80) or https (443) if the Web server is configured differently. The port number follows the host name, preceded by a colon.

See Also

Specifying a Connection Using HTTP

4.1.12.5.8 TWebConnection.UserName Property

Specifies the user name that allows the client application to log on to the application server.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

When the Web connection component connects to the application server on a local host or to the proxy server, it supplies the values of the UserName and Password (see page 263) properties so that it can log in. If neither the host nor the proxy server requires authentication, UserName can be an empty string.

See Also

Password (see page 263)

Specifying a Connection Using HTTP

4.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDataBlock (see page 266)	IDataBlock is the interface used by data block interpreters to access memory buffers.
	IDataIntercept (see page 274)	IDataIntercept is the interface used by TSocketConnection (see page 221) components to transform data that is communicated over the connection.
	ISendDataBlock (see page 276)	ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.
	ITransport (see page 278)	ITransport is the interface used by TStreamedConnection (see page 236) to connect to, read from, and write to a remote application server.

4.2.1 IDataBlock Interface

IDataBlock is the interface used by data block interpreters to access memory buffers.

Class Hierarchy

Pascal

```
IDataBlock = interface(IUnknown);
```

C++

```
__interface IDataBlock : public IUnknown;
```

File

SConnect

Description

Data block interpreters uses IDataBlock when marshaling COM interface calls. Streamed connection components send data obtained from IDataBlock to an application server once the data block interpreter has filled its memory by marshaling interface calls. They also read data from the application server into IDataBlock and pass it to a data block interpreter for marshaling.

IDataBlock is an interface, and as such can't be directly instantiated. Instead, objects that implement the IDataBlock properties and methods include IDataBlock in their class definition (Delphi) or be derived from IDataBlock (C++). Such objects can be cast to an IDataBlock so that they can be used by data block interpreters.

Note: C++ method declarations that use IDataBlock use the _di_IDataBlock type instead. This is a DelphiInterface (see page 3256) wrapper around the IDataBlock interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDataBlock >  _di_IDataBlock;
```

See Also

TCustomDataBlockInterpreter (see page 192)

TStreamedConnection (see page 236)

4.2.1.1 IDataBlock Members

The following tables list the members exposed by IDataBlock.

Public Methods

	Name	Description
	Clear (see page 267)	Removes all data from Memory (see page 272) except for the reserved bytes.
	GetBytesReserved (see page 268)	Returns the value of the BytesReserved (see page 272) property.
	GetMemory (see page 268)	Returns the value of the Memory (see page 272) property.
	GetSignature (see page 268)	Returns the value of the Signature (see page 273) property.
	GetSize (see page 269)	Returns the value of the Size (see page 273) property.
	GetStream (see page 269)	Returns the value of the Stream (see page 274) property.
	IgnoreStream (see page 269)	Informs the data block when its stream is invalidated.
	InitData (see page 270)	Adds data to the data block.
	Read (see page 270)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 271)	Sets the value of the Signature (see page 273) property.
	SetSize (see page 271)	Sets the value of the Size (see page 273) property.
	Write (see page 271)	Writes a specified number of bytes from a buffer.

Public Properties

	Name	Description
R	BytesReserved (see page 272)	Indicates the number of bytes from Memory (see page 272) that are reserved for internal use.
R	Memory (see page 272)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 273)	Indicates the contents of the data block.
	Size (see page 273)	Indicates the size of the data in the memory buffer.
R	Stream (see page 274)	Provides access to an internal stream that contains the data block's memory.

4.2.1.2 IDataBlock Methods

The methods of the IDataBlock class are listed here.

Public Methods

	Name	Description
	Clear (see page 267)	Removes all data from Memory (see page 272) except for the reserved bytes.
	GetBytesReserved (see page 268)	Returns the value of the BytesReserved (see page 272) property.
	GetMemory (see page 268)	Returns the value of the Memory (see page 272) property.
	GetSignature (see page 268)	Returns the value of the Signature (see page 273) property.
	GetSize (see page 269)	Returns the value of the Size (see page 273) property.
	GetStream (see page 269)	Returns the value of the Stream (see page 274) property.
	IgnoreStream (see page 269)	Informs the data block when its stream is invalidated.
	InitData (see page 270)	Adds data to the data block.
	Read (see page 270)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 271)	Sets the value of the Signature (see page 273) property.
	SetSize (see page 271)	Sets the value of the Size (see page 273) property.
	Write (see page 271)	Writes a specified number of bytes from a buffer.

4.2.1.2.1 IDataBlock.Clear Method

Removes all data from Memory (see page 272) except for the reserved bytes.

Pascal

```
procedure Clear; stdcall;
```

C++

```
__fastcall __stdcall Clear();
```

Description

Call Clear when finished reading from Memory (see page 272) or when the information written to Memory (see page 272) has been used. Clear reclaims the resources used to store information that is read from or written to the data block.

See Also

BytesReserved (see page 272)

Memory (see page 272)

4.2.1.2.2 IDataBlock.GetBytesReserved Method

Returns the value of the BytesReserved (see page 272) property.

Pascal

```
function GetBytesReserved: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetBytesReserved();
```

Description

GetBytesReserved is the read implementer for the BytesReserved (see page 272) property.

See Also

BytesReserved (see page 272)

4.2.1.2.3 IDataBlock.GetMemory Method

Returns the value of the Memory (see page 272) property.

Pascal

```
function GetMemory: Pointer; stdcall;
```

C++

```
__fastcall __stdcall void * GetMemory();
```

Description

GetMemory is the read implementer for the Memory (see page 272) property.

See Also

Memory (see page 272)

4.2.1.2.4 IDataBlock.GetSignature Method

Returns the value of the Signature (see page 273) property.

Pascal

```
function GetSignature: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSignature();
```

Description

GetSignature is the read implementer for the Signature (see page 273) property.

See Also

Signature (see page 273)

4.2.1.2.5 IDataBlock.GetSize Method

Returns the value of the Size (see page 273) property.

Pascal

```
function GetSize: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSize();
```

Description

GetSize is the read implementer for the Size (see page 273) property.

See Also

Size (see page 273)

4.2.1.2.6 IDataBlock.GetStream Method

Returns the value of the Stream (see page 274) property.

Pascal

```
function GetStream: TStream; stdcall;
```

C++

```
__fastcall __stdcall TStream GetStream();
```

Description

GetStream is the read implementer for the Stream (see page 274) property.

See Also

Stream (see page 274)

4.2.1.2.7 IDataBlock.IgnoreStream Method

Informs the data block when its stream is invalidated.

Pascal

```
procedure IgnoreStream; stdcall;
```

C++

```
__fastcall __stdcall IgnoreStream();
```

Description

Call IgnoreStream after taking responsibility for freeing the component specified by Stream (see page 274). After a call to

IgnoreStream, the data block will not free the memory for its internal Stream (see page 274) component.

See Also

Stream (see page 274)

4.2.1.2.8 IDataBlock.InitData Method

Adds data to the data block.

Pascal

```
function InitData(Data: Pointer; DataLen: Integer; CheckLen: Boolean): Integer; stdcall;
```

C++

```
__fastcall __stdcall int InitData(void * Data, int DataLen, Boolean CheckLen);
```

Description

Data is the data to be added to the data block. It must include a valid signature or InitData raises an exception.

DataLen is the number of bytes referenced by Data.

CheckLen specifies whether InitData should verify that the signature indicates the same amount of data as is indicated by the DataLen parameter.

See Also

Signature (see page 273)

4.2.1.2.9 IDataBlock.Read Method

Reads a specified number of bytes into a buffer.

Pascal

```
function Read(var Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Read( Buffer, int Count);
```

Description

Call Read to copy the contents stored in the memory buffer to the buffer supplied by the Buffer parameter. Read reads up to Count bytes and returns the number of bytes actually read.

The first call to Read begins reading from Memory (see page 272) at the first position after the reserved bytes. Subsequent calls begin reading at the point where the last call to Read left off.

Note: The Count parameter should specify a value less than or equal to Size (see page 273) - BytesReserved (see page 272).

See Also

Write (see page 271)

Memory (see page 272)

Size (see page 273)

BytesReserved (see page 272)

4.2.1.2.10 IDataBlock.SetSignature Method

Sets the value of the Signature (see page 273) property.

Pascal

```
procedure SetSignature(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSignature(int Value);
```

Description

SetSignature is the write implementer for the Signature (see page 273) property.

See Also

Signature (see page 273)

4.2.1.2.11 IDataBlock.SetSize Method

Sets the value of the Size (see page 273) property.

Pascal

```
procedure SetSize(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSize(int Value);
```

Description

SetSize is the write implementer for the Size (see page 273) property.

See Also

Size (see page 273)

4.2.1.2.12 IDataBlock.Write Method

Writes a specified number of bytes from a buffer.

Pascal

```
function Write(const Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Write(const  Buffer, int Count);
```

Description

Call Write to copy the contents of the buffer supplied as the Buffer parameter to the next position in Memory (see page 272). Write writes up to Count bytes and returns the number of bytes actually written.

The first call to Write begins writing to Memory (see page 272) at the first position after the reserved bytes. Subsequent calls begin writing at the point where the last call to Write left off.

Note: The Count parameter should specify a value less than or equal to Size (see page 273) - BytesReserved (see page 272).

See Also

Read (see page 270)

Memory (see page 272)

Size (see page 273)

BytesReserved (see page 272)

4.2.1.3 IDataBlock Properties

The properties of the IDataBlock class are listed here.

Public Properties

	Name	Description
	BytesReserved (see page 272)	Indicates the number of bytes from Memory (see page 272) that are reserved for internal use.
	Memory (see page 272)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 273)	Indicates the contents of the data block.
	Size (see page 273)	Indicates the size of the data in the memory buffer.
	Stream (see page 274)	Provides access to an internal stream that contains the data block's memory.

4.2.1.3.1 IDataBlock.BytesReserved Property

Indicates the number of bytes from Memory (see page 272) that are reserved for internal use.

Pascal

```
property BytesReserved: Integer;
```

C++

```
__property int BytesReserved;
```

Description

BytesReserved indicates how many bytes of Memory (see page 272) can't be used for reading and writing. When interpreting the value of the Size (see page 273) property, use BytesReserved to determine how much buffer space is available for reading and writing data.

See Also

Memory (see page 272)

Size (see page 273)

4.2.1.3.2 IDataBlock.Memory Property

Points to a buffer from which data is read or to which data is written.

Pascal

```
property Memory: Pointer;
```

C++

```
__property void * Memory;
```

Description

Memory provides access to the buffer that contains data that is read or written. Memory includes a reserved area (of size BytesReserved (see page 272)) for internal information such as the value of Signature (see page 273),

Note: When implementing the Receive and Send methods of the ITransport (see page 278) interface, component writers should read directly from and write directly to Memory, rather than using the Read (see page 270) and Write (see page 271)

methods. Otherwise, the information in the reserved area will not be sent to or from the application server.

See Also

Size (see page 273)

ITransport (see page 278)

BytesReserved (see page 272)

Signature (see page 273)

Stream (see page 274)

4.2.1.3.3 IDataBlock.Signature Property

Indicates the contents of the data block.

Pascal

```
property Signature: Integer;
```

C++

```
__property int Signature;
```

Description

Write (see page 271) Signature values to indicate what type of data is written to the data block. Read (see page 270) Signature to determine what type of data can be read from the data block.

The value of signature is stored somewhere in the first BytesReserved (see page 272) bytes of Memory (see page 272).

See Also

BytesReserved (see page 272)

Memory (see page 272)

4.2.1.3.4 IDataBlock.Size Property

Indicates the size of the data in the memory buffer.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is the number of bytes available in Memory (see page 272), excluding the reserved bytes. Set Size to ensure that Memory (see page 272) is large enough to contain the data that the data block will read or write.

See Also

BytesReserved (see page 272)

Memory (see page 272)

Signature (see page 273)

4.2.1.3.5 IDataBlock.Stream Property

Provides access to an internal stream that contains the data block's memory.

Pascal

```
property Stream: TStream;
```

C++

```
__property TStream Stream;
```

Description

Stream allows component writers more convenient access to the data block's memory buffer. This memory buffer contains the data that is read or written.

See Also

Memory (see page 272)

IgnoreStream (see page 269)

TMemoryStream

4.2.2 IDataIntercept Interface

IDataIntercept is the interface used by TSocketConnection (see page 221) components to transform data that is communicated over the connection.

Class Hierarchy

Pascal

```
IDataIntercept = interface;
```

C++

```
__interface IDataIntercept;
```

File

SConnect

Description

IDataIntercept is the interface implemented by data packet interceptors. A data packet interceptor is a COM object that implements IDataIntercept to transform data that is accessed through an IDataBlock (see page 266) interface. TSocketConnection (see page 221) can use a data packet interceptor before messages are sent and after responses are received.

Developers can create a data packet interceptor to encrypt and decrypt data or to compress and decompress messages. The transformation must leave the reserved bytes of the data blocks unchanged or the socket connection component won't be able to communicate properly.

Note: When creating a data packet interceptor in Delphi, use TPacketInterceptFactory (see page 219) as its class factory.

Once you have created and registered a data packet interceptor, Set the InterceptName or InterceptGUID property of a socket connection component to identify the data packet interceptor. This tells the socket connection to instantiate the interceptor and use it to transform messages before they are sent and after they are received. On the server side, right click on the Tray Icon for

scktsrvr.exe and assign the interceptor using the properties dialog.

See Also

IDataBlock (see page 266)

TStreamedConnection (see page 236)

TPacketInterceptFactory (see page 219)

Specifying a Connection Using Sockets

4.2.2.1 IDataIntercept Members

The following tables list the members exposed by IDataIntercept.

Public Methods

	Name	Description
	DataIn (see page 275)	Undoes the transformation applied by the DataOut (see page 276) method.
	DataOut (see page 276)	Returns the value of the BytesReserved property.

4.2.2.2 IDataIntercept Methods

The methods of the IDataIntercept class are listed here.

Public Methods

	Name	Description
	DataIn (see page 275)	Undoes the transformation applied by the DataOut (see page 276) method.
	DataOut (see page 276)	Returns the value of the BytesReserved property.

4.2.2.2.1 IDataIntercept.DataIn Method

Undoes the transformation applied by the DataOut (see page 276) method.

Pascal

```
procedure DataIn(const Data: IDataBlock); stdcall;
```

C++

```
__fastcall __stdcall DataIn(const IDataBlock Data);
```

Description

Call DataIn to undo any transformations that were applied to information received by the connection. For example, use this method to decrypt or decompress data.

The Data parameter is an IDataBlock (see page 266) interface to the data that was received by the socket connection component. Use the properties and methods of IDataBlock (see page 266) to reverse the transformation that was applied by the DataOut (see page 276) method.

Warning: Do not transform the reserved bytes in the data block.

See Also

DataOut (see page 276)

BytesReserved (see page 272)

4.2.2.2.2 IDataIntercept.DataOut Method

Returns the value of the BytesReserved property.

Pascal

```
procedure DataOut(const Data: IDataBlock); stdcall;
```

C++

```
__fastcall __stdcall DataOut(const IDataBlock Data);
```

Description

Call DataOut to transform data before it is sent using a connection component. For example, use this method to encrypt or compress data.

The Data parameter is an IDataBlock (see page 266) interface to the data that is about to be sent by the socket connection component. Use the properties and methods of IDataBlock (see page 266) to transform the data.

Warning: Do not transform the reserved bytes in the data block.

See Also

DataIn (see page 275)

BytesReserved (see page 272)

4.2.3 ISendDataBlock Interface

ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.

Class Hierarchy

Pascal

```
ISendDataBlock = interface;
```

C++

```
__interface ISendDataBlock;
```

File

SConnect

Description

Streamed connection components implement ISendDataBlock to allow a data block interpreter (which handles marshaling of COM interface calls) to send interface calls to the application server.

ISendDataBlock is an interface, and as such can't be directly instantiated. Instead, streamed connection components (which implement ISendDataBlock) can be cast to an ISendDataBlock (Delphi) or have a conversion operator to obtain this interface (C++).

Note: TDataBlockInterpreter (see page 207) uses _di_ISendDataBlock in place of ISendDataBlock. This is a DelphiInterface (see page 3256) wrapper around the ISendDataBlock interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< ISendDataBlock > _di_ISendDataBlock;
```

See Also

TStreamedConnection (see page 236)

TCustomDataBlockInterpreter (see page 192)

IDataBlock (see page 266)

4.2.3.1 ISendDataBlock Members

The following tables list the members exposed by ISendDataBlock.

Public Methods

	Name	Description
	Send (see page 277)	Sends information retrieved from an IDataBlock (see page 266) interface to the application server.

4.2.3.2 ISendDataBlock Methods

The methods of the ISendDataBlock class are listed here.

Public Methods

	Name	Description
	Send (see page 277)	Sends information retrieved from an IDataBlock (see page 266) interface to the application server.

4.2.3.2.1 ISendDataBlock.Send Method

Sends information retrieved from an IDataBlock (see page 266) interface to the application server.

Pascal

```
function Send(const Data: IDataBlock; WaitForResult: Boolean): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Send(const IDataBlock Data, Boolean WaitForResult);
```

Description

ISendDataBlock (see page 276) dispatches information to an application server. The information must be available as the Memory property of an IDataBlock (see page 266) interface.

The WaitForResult parameter indicates whether the caller requires a response when the information is sent. If WaitForResult is true, Send does not return until a response is received from the application server. This response is returned as an IDataBlock (see page 266) interface (_di_IDataBlock). If WaitForResult is false, Send may still return a response, but only if the application server responds immediately.

See Also

Memory (see page 272)

Send (see page 244)

4.2.4 ITransport Interface

ITransport is the interface used by TStreamedConnection (see page 236) to connect to, read from, and write to a remote application server.

Class Hierarchy

Pascal

```
ITransport = interface(IUnknown);
```

C++

```
__interface ITransport : public IUnknown;
```

File

SConnect

Description

Streamed connection components use ITransport to connect to an application server and to send or receive data over that connection. ITransport is responsible only for managing the communication protocols. It does not provide any support for marshaling or storing information.

ITransport is an interface, and as such can't be directly instantiated. Instead, objects that implement the ITransport properties and methods include ITransport in their class definition (Delphi) or are derived from ITransport (C++). Such objects can be cast to an ITransport so that they can be used by streamed connection components.

Note: C++ method declarations that use ITransport use the _di_ITransport type instead. This is a DelphiInterface (see page 3256) wrapper around the ITransport interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< ITransport> _di_ITransport;
```

See Also

TStreamedConnection (see page 236)

4.2.4.1 ITransport Members

The following tables list the members exposed by ITransport.

Public Methods

	Name	Description
	GetConnected (see page 279)	Returns the value of the Connected (see page 281) property.
	GetWaitEvent (see page 279)	Returns the handle for an event object that is managed by the object that implements ITransport (see page 278).
	Receive (see page 280)	Returns an IDataBlock (see page 266) interface that can be used to read information received from the application server.
	Send (see page 280)	Sends information retrieved from an IDataBlock (see page 266) interface to the application server.
	SetConnected (see page 280)	Sets the value of the Connected (see page 281) property.

Public Properties

	Name	Description
	Connected (see page 281)	Indicates whether the connection to the application server is established.

4.2.4.2 ITransport Methods

The methods of the ITransport class are listed here.

Public Methods

	Name	Description
	GetConnected (see page 279)	Returns the value of the Connected (see page 281) property.
	GetWaitEvent (see page 279)	Returns the handle for an event object that is managed by the object that implements ITransport (see page 278).
	Receive (see page 280)	Returns an IDataBlock (see page 266) interface that can be used to read information received from the application server.
	Send (see page 280)	Sends information retrieved from an IDataBlock (see page 266) interface to the application server.
	SetConnected (see page 280)	Sets the value of the Connected (see page 281) property.

4.2.4.2.1 ITransport.GetConnected Method

Returns the value of the Connected (see page 281) property.

Pascal

```
function GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean GetConnected();
```

Description

GetConnected is the read property implementer for the Connected (see page 281) property.

See Also

Connected (see page 281)

4.2.4.2.2 ITransport.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport (see page 278).

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport (see page 278).

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport (see page 278),

create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 3133)

4.2.4.2.3 ITransport.Receive Method

Returns an IDataBlock (see page 266) interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock (see page 266) interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport (see page 278). Its value is the return value of the Send (see page 280) method.

See Also

Memory (see page 272)

Send (see page 280)

4.2.4.2.4 ITransport.Send Method

Sends information retrieved from an IDataBlock (see page 266) interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive (see page 280) method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 272)

Receive (see page 280)

4.2.4.2.5 ITransport.SetConnected Method

Sets the value of the Connected (see page 281) property.

Pascal

```
procedure SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall SetConnected(Boolean Value);
```

Description

SetConnected is the write implementer for the Connected (see page 281) property.

4.2.4.3 ITransport Properties

The properties of the ITransport class are listed here.

Public Properties

	Name	Description
	Connected (see page 281)	Indicates whether the connection to the application server is established.

4.2.4.3.1 ITransport.Connected Property

Indicates whether the connection to the application server is established.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to connect to the application server. Set Connected to false to close a connection.

Read (see page 3634) the Connected property to verify that the connection is open before reading from or writing to the application server.

See Also

Receive (see page 280)

Send (see page 280)

4.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetPacketInterceptorList (see page 282)	This is function SConnect.GetPacketInterceptorList.
	LoadWinSock2 (see page 282)	This is function SConnect.LoadWinSock2.

4.3.1 SConnect.GetPacketInterceptorList Function

Pascal

```
procedure GetPacketInterceptorList(List: TStringList);
```

C++

```
GetPacketInterceptorList(TStringList List);
```

File

SConnect

Description

This is function SConnect.GetPacketInterceptorList.

4.3.2 SConnect.LoadWinSock2 Function

Pascal

```
function LoadWinSock2: Boolean;
```

C++

```
Boolean LoadWinSock2();
```

File

SConnect

Description

This is function SConnect.LoadWinSock2.

4.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TVarFlag (see page 283)	This is record SConnect.TVarFlag.

4.4.1 SConnect.TVarFlag Enumeration

Pascal

```
TVarFlag = (
  vfByRef,
  vfVariant
);
```

C++

```
enum TVarFlag {
  vfByRef,
  vfVariant
};
```

File

SConnect

Description

This is record SConnect.TVarFlag.

4.5 Types

The following table lists types in this documentation.

Types

Name	Description
PIntArray (see page 284)	This is type SConnect.PIntArray.
PVariantArray (see page 284)	This is type SConnect.PVariantArray.
TIntArray (see page 285)	This is type SConnect.TIntArray.
TVarFlags (see page 285)	This is type SConnect.TVarFlags.
TVariantArray (see page 285)	This is type SConnect.TVariantArray.

4.5.1 SConnect.PIntArray Type

Pascal

```
PIntArray = ^TIntArray;
```

C++

```
^TIntArray PIntArray;
```

File

SConnect

Description

This is type SConnect.PIntArray.

4.5.2 SConnect.PVariantArray Type

Pascal

```
PVariantArray = ^TVariantArray;
```

C++

```
^TVariantArray PVariantArray;
```

File

SConnect

Description

This is type SConnect.PVariantArray.

4.5.3 SConnect.TIntArray Type

Pascal

```
TIntArray = array[0..0] of Integer;
```

C++

```
array[0..0] of Integer TIntArray;
```

File

SConnect

Description

This is type SConnect.TIntArray.

4.5.4 SConnect.TVarFlags Type

Pascal

```
TVarFlags = set of TVarFlag;
```

C++

```
TVarFlag TVarFlags;
```

File

SConnect

Description

This is type SConnect.TVarFlags.

4.5.5 SConnect.TVariantArray Type

Pascal

```
TVariantArray = array[0..0] of OleVariant;
```

C++

```
array[0..0] of OleVariant TVariantArray;
```

File

SConnect

Description

This is type SConnect.TVariantArray.

4.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
WSACloseEvent (see page 286)	This is variable SConnect.WSACloseEvent.
WSACreateEvent (see page 286)	This is variable SConnect.WSACreateEvent.
WSAEventSelect (see page 287)	This is variable SConnect.WSAEventSelect.
WSAResetEvent (see page 287)	This is variable SConnect.WSAResetEvent.

4.6.1 SConnect.WSACloseEvent Variable

Pascal

```
WSACloseEvent: function(hEvent: THandle): Boolean stdcall;
```

C++

```
function(hEvent: THandle): Boolean stdcall WSACloseEvent;
```

File

SConnect

Description

This is variable SConnect.WSACloseEvent.

4.6.2 SConnect.WSACreateEvent Variable

Pascal

```
WSACreateEvent: function: THandle stdcall;
```

C++

```
function: THandle stdcall WSACreateEvent;
```

File

SConnect

Description

This is variable SConnect.WSACreateEvent.

4.6.3 SConnect.WSAEventSelect Variable

Pascal

```
WSAEventSelect: function(s: TSocket; hEventObject: THandle; lNetworkEvents: Integer): Integer
stdcall;
```

C++

```
function(s: TSocket; hEventObject: THandle; lNetworkEvents: Integer): Integer stdcall
WSAEventSelect;
```

File

SConnect

Description

This is variable SConnect.WSAEventSelect.

4.6.4 SConnect.WSAResetEvent Variable

Pascal

```
WSAResetEvent: function(hEvent: THandle): Boolean stdcall;
```

C++

```
function(hEvent: THandle): Boolean stdcall WSAResetEvent;
```

File

SConnect

Description

This is variable SConnect.WSAResetEvent.

4.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
asCreateObject (see page 288)	This is constant SConnect.asCreateObject.
asError (see page 288)	This is constant SConnect.asError.
asFreeObject (see page 289)	This is constant SConnect.asFreeObject.
asGetAppServers (see page 289)	This is constant SConnect.asGetAppServers.
asGetGUID (see page 289)	This is constant SConnect.asGetGUID.
asGetID (see page 290)	This is constant SConnect.asGetID.
asGetServers (see page 290)	This is constant SConnect.asGetServers.
asInvoke (see page 290)	This is constant SConnect.asInvoke.
asMask (see page 291)	This is constant SConnect.asMask.
asSoapCommand (see page 291)	This is constant SConnect.asSoapCommand.
CallSig (see page 291)	This is constant SConnect.CallSig.
ResultSig (see page 292)	This is constant SConnect.ResultSig.
THREAD_EXCEPTION (see page 292)	This is constant SConnect.THREAD_EXCEPTION.
THREAD_RECEIVEDSTREAM (see page 292)	This is constant SConnect.THREAD_RECEIVEDSTREAM.
THREAD_REPLACETRANSPORT (see page 293)	This is constant SConnect.THREAD_REPLACETRANSPORT.
THREAD_SENDNOTIFY (see page 293)	This is constant SConnect.THREAD_SENDNOTIFY.
THREAD_SENDSTREAM (see page 293)	This is constant SConnect.THREAD_SENDSTREAM.

4.7.1 SConnect.asCreateObject Constant

Pascal

```
asCreateObject = $04;
```

C++

```
asCreateObject = 0x04;
```

File

SConnect

Description

This is constant SConnect.asCreateObject.

4.7.2 SConnect.asError Constant

Pascal

```
asError = $01;
```

C++

```
asError = 0x01;
```

File

SConnect

Description

This is constant SConnect.asError.

4.7.3 SConnect.asFreeObject Constant

Pascal

```
asFreeObject = $05;
```

C++

```
asFreeObject = 0x05;
```

File

SConnect

Description

This is constant SConnect.asFreeObject.

4.7.4 SConnect.asGetAppServers Constant

Pascal

```
asGetAppServers = $12;
```

C++

```
asGetAppServers = 0x12;
```

File

SConnect

Description

This is constant SConnect.asGetAppServers.

4.7.5 SConnect.asGetGUID Constant

Pascal

```
asGetGUID = $11;
```

C++

```
asGetGUID = 0x11;
```

File

SConnect

Description

This is constant SConnect.asGetGUID.

4.7.6 SConnect.asGetID Constant

Pascal

```
asGetID = $03;
```

C++

```
asGetID = 0x03;
```

File

SConnect

Description

This is constant SConnect.asGetID.

4.7.7 SConnect.asGetServers Constant

Pascal

```
asGetServers = $10;
```

C++

```
asGetServers = 0x10;
```

File

SConnect

Description

This is constant SConnect.asGetServers.

4.7.8 SConnect.asInvoke Constant

Pascal

```
asInvoke = $02;
```

C++

```
asInvoke = 0x02;
```

File

SConnect

Description

This is constant SConnect.asInvoke.

4.7.9 SConnect.asMask Constant

Pascal

```
asMask = $FF;
```

C++

```
asMask = 0xFF;
```

File

SConnect

Description

This is constant SConnect.asMask.

4.7.10 SConnect.asSoapCommand Constant

Pascal

```
asSoapCommand = $14;
```

C++

```
asSoapCommand = 0x14;
```

File

SConnect

Description

This is constant SConnect.asSoapCommand.

4.7.11 SConnect.CallSig Constant

Pascal

```
CallSig = $DA00;
```

C++

```
CallSig = 0xDA00;
```

File

SConnect

Description

This is constant SConnect.CallSig.

4.7.12 SConnect.ResultSig Constant

Pascal

```
ResultSig = $DB00;
```

C++

```
ResultSig = 0xDB00;
```

File

SConnect

Description

This is constant SConnect.ResultSig.

4.7.13 SConnect.THREAD_EXCEPTION Constant

Pascal

```
THREAD_EXCEPTION = THREAD_RECEIVEDSTREAM + 1;
```

C++

```
THREAD_EXCEPTION = THREAD_RECEIVEDSTREAM + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_EXCEPTION.

4.7.14 SConnect.THREAD_RECEIVEDSTREAM Constant

Pascal

```
THREAD_RECEIVEDSTREAM = THREAD_SENDSTREAM + 1;
```

C++

```
THREAD_RECEIVEDSTREAM = THREAD_SENDSTREAM + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_RECEIVEDSTREAM.

4.7.15 SConnect.THREAD_REPLACETRANSPORT Constant

Pascal

```
THREAD_REPLACETRANSPORT = THREAD_SENDNOTIFY + 1;
```

C++

```
THREAD_REPLACETRANSPORT = THREAD_SENDNOTIFY + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_REPLACETRANSPORT.

4.7.16 SConnect.THREAD_SENDNOTIFY Constant

Pascal

```
THREAD_SENDNOTIFY = THREAD_EXCEPTION + 1;
```

C++

```
THREAD_SENDNOTIFY = THREAD_EXCEPTION + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_SENDNOTIFY.

4.7.17 SConnect.THREAD_SENDSTREAM Constant

Pascal

```
THREAD_SENDSTREAM = WM_USER + 1;
```

C++

```
THREAD_SENDSTREAM = WM_USER + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_SENDSTREAM.

5 ScreenTips Namespace

This is namespace ScreenTips.

Topics

Name	Description
Classes (see page 297)	The following table lists classes in this documentation.
Interfaces (see page 361)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 363)	The following table lists structs, records, enums in this documentation.
Types (see page 366)	The following table lists types in this documentation.
Constants (see page 369)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAllocatedActionsException (see page 297)	This is class ScreenTips.EAllocatedActionsException.
	TAllocatedActions (see page 297)	This is class ScreenTips.TAllocatedActions.
	TAssociateItem (see page 301)	This is class ScreenTips.TAssociateItem.
	TAssociateItemList (see page 302)	This is class ScreenTips.TAssociateItemList.
	TCustomScreenTipsManager (see page 305)	This is class ScreenTips.TCustomScreenTipsManager.
	TCustomScreenTipsPopup (see page 316)	This is class ScreenTips.TCustomScreenTipsPopup.
	TDisplayOffset (see page 324)	This is class ScreenTips.TDisplayOffset.
	TScreenTipBorderStyle (see page 326)	This is class ScreenTips.TScreenTipBorderStyle.
	TScreenTipItem (see page 328)	This is class ScreenTips.TScreenTipItem.
	TScreenTipsCollection (see page 334)	This is class ScreenTips.TScreenTipsCollection.
	TScreenTipsManager (see page 337)	This is class ScreenTips.TScreenTipsManager.
	TScreenTipsPopup (see page 343)	This is class ScreenTips.TScreenTipsPopup.
	TScreenTipsWindow (see page 351)	This is class ScreenTips.TScreenTipsWindow.

Constants

Name	Description
cDefaultBorderColor (see page 369)	This is constant ScreenTips.cDefaultBorderColor.
cDefaultEndColor (see page 369)	This is constant ScreenTips.cDefaultEndColor.
cDefaultStartColor (see page 370)	This is constant ScreenTips.cDefaultStartColor.
cScreenTipHeaderSpacing (see page 370)	This is constant ScreenTips.cScreenTipHeaderSpacing.
cScreenTipMinimumHeight (see page 370)	This is constant ScreenTips.cScreenTipMinimumHeight.
cScreenTipTextAndImageWidth (see page 371)	This is constant ScreenTips.cScreenTipTextAndImageWidth.
cScreenTipTextOnlyWidth (see page 371)	This is constant ScreenTips.cScreenTipTextOnlyWidth.

Interfaces

	Name	Description
	IScreenTipItem (see page 361)	This is class ScreenTips.IScreenTipItem.

Structs, Records, Enums

	Name	Description
	TDescriptionType (see page 363)	This is record ScreenTips.TDescriptionType.
	TImageAlign (see page 363)	This is record ScreenTips.TImageAlign.
	TItemImageAlign (see page 364)	This is record ScreenTips.TItemImageAlign.
	TScreenTipOption (see page 364)	This is record ScreenTips.TScreenTipOption.
	TScreenTipPopupType (see page 365)	This is record ScreenTips.TScreenTipPopupType.
	TTipBorderStyle (see page 365)	This is record ScreenTips.TTipBorderStyle.

Types

Name	Description
TCreateScreenTipEvent (see page 366)	This is type ScreenTips.TCreateScreenTipEvent.
TDuplicateCreateErrorEvent (see page 366)	This is type ScreenTips.TDuplicateCreateErrorEvent.
TScreenTipOptions (see page 367)	This is type ScreenTips.TScreenTipOptions.
TScreenTipsWindowClass (see page 367)	This is type ScreenTips.TScreenTipsWindowClass.
TScreenTipWinClass (see page 367)	This is type ScreenTips.TScreenTipWinClass.
TShowScreenTipEvent (see page 368)	This is type ScreenTips.TShowScreenTipEvent.

5.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAllocatedActionsException (see page 297)	This is class ScreenTips.EAllocatedActionsException.
	TAllocatedActions (see page 297)	This is class ScreenTips.TAllocatedActions.
	TAssociateItem (see page 301)	This is class ScreenTips.TAssociateItem.
	TAssociateItemList (see page 302)	This is class ScreenTips.TAssociateItemList.
	TCustomScreenTipsManager (see page 305)	This is class ScreenTips.TCustomScreenTipsManager.
	TCustomScreenTipsPopup (see page 316)	This is class ScreenTips.TCustomScreenTipsPopup.
	TDisplayOffset (see page 324)	This is class ScreenTips.TDisplayOffset.
	TScreenTipBorderStyle (see page 326)	This is class ScreenTips.TScreenTipBorderStyle.
	TScreenTipItem (see page 328)	This is class ScreenTips.TScreenTipItem.
	TScreenTipsCollection (see page 334)	This is class ScreenTips.TScreenTipsCollection.
	TScreenTipsManager (see page 337)	This is class ScreenTips.TScreenTipsManager.
	TScreenTipsPopup (see page 343)	This is class ScreenTips.TScreenTipsPopup.
	TScreenTipsWindow (see page 351)	This is class ScreenTips.TScreenTipsWindow.

5.1.1 EAllocatedActionsException Class

Class Hierarchy

Pascal

```
EAllocatedActionsException = class(Exception);
```

C++

```
class EAllocatedActionsException : public Exception;
```

File

ScreenTips

Description

This is class ScreenTips.EAllocatedActionsException.

5.1.2 TAllocatedActions Class

Class Hierarchy

Pascal

```
TAllocatedActions = class;
```

C++

```
class TAllocatedActions;
```

File

ScreenTips

Description

This is class ScreenTips.TAllocatedActions.

5.1.2.1 TAllocatedActions Members

The following tables list the members exposed by TAllocatedActions.

Public Methods

	Name	Description
	AddAction (see page 299)	This is AddAction, a member of class TAllocatedActions.
	Clear (see page 299)	This is Clear, a member of class TAllocatedActions.
	Create (see page 298)	This is Create, a member of class TAllocatedActions.
	Delete (see page 299)	This is Delete, a member of class TAllocatedActions.
V	Destroy (see page 298)	This is Destroy, a member of class TAllocatedActions.
	Exists (see page 299)	This is Exists, a member of class TAllocatedActions.
	Find (see page 300)	This is Find, a member of class TAllocatedActions.
	GetItem (see page 300)	This is GetItem, a member of class TAllocatedActions.

Public Properties

	Name	Description
R	Count (see page 300)	This is Count, a member of class TAllocatedActions.

5.1.2.2 TAllocatedActions.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TAllocatedActions();
```

Description

This is Create, a member of class TAllocatedActions.

5.1.2.3 TAllocatedActions.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAllocatedActions();
```

Description

This is Destroy, a member of class TAllocatedActions.

5.1.2.4 TAllocatedActions Methods

The methods of the TAllocatedActions class are listed here.

Public Methods

	Name	Description
	AddAction (see page 299)	This is AddAction, a member of class TAllocatedActions.
	Clear (see page 299)	This is Clear, a member of class TAllocatedActions.
	Delete (see page 299)	This is Delete, a member of class TAllocatedActions.
	Exists (see page 299)	This is Exists, a member of class TAllocatedActions.
	Find (see page 300)	This is Find, a member of class TAllocatedActions.
	GetItem (see page 300)	This is GetItem, a member of class TAllocatedActions.

5.1.2.4.1 TAllocatedActions.AddAction Method

Pascal

```
procedure AddAction(const aName: string; aScreenTipItem: TObject);
```

C++

```
__fastcall AddAction(const UnicodeString aName, TObject * aScreenTipItem);
```

Description

This is AddAction, a member of class TAllocatedActions.

5.1.2.4.2 TAllocatedActions.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TAllocatedActions.

5.1.2.4.3 TAllocatedActions.Delete Method

Pascal

```
function Delete(const aName: string; out aIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean Delete(const UnicodeString aName, int aIndex);
```

Description

This is Delete, a member of class TAllocatedActions.

5.1.2.4.4 TAllocatedActions.Exists Method

Pascal

```
function Exists(const aName: string): Boolean;
```

C++

```
__fastcall Boolean Exists(const UnicodeString aName);
```

Description

This is Exists, a member of class TAllocatedActions.

5.1.2.4.5 TAllocatedActions.Find Method

Pascal

```
function Find(const aName: string; out aIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean Find(const UnicodeString aName, int aIndex);
```

Description

This is Find, a member of class TAllocatedActions.

5.1.2.4.6 TAllocatedActions.GetItem Method

Pascal

```
function GetItem(const aName: string): TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem GetItem(const UnicodeString aName);
```

Description

This is GetItem, a member of class TAllocatedActions.

5.1.2.5 TAllocatedActions Properties

The properties of the TAllocatedActions class are listed here.

Public Properties

	Name	Description
	Count (see page 300)	This is Count, a member of class TAllocatedActions.

5.1.2.5.1 TAllocatedActions.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAllocatedActions.

5.1.3 TAssociateItem Class

Class Hierarchy

Pascal

```
TAssociateItem = class;
```

C++

```
class TAssociateItem;
```

File

ScreenTips

Description

This is class ScreenTips.TAssociateItem.

5.1.3.1 TAssociateItem Members

The following tables list the members exposed by TAssociateItem.

Public Methods

	Name	Description
	Create (see page 301)	This is Create, a member of class TAssociateItem.
	Destroy (see page 301)	This is Destroy, a member of class TAssociateItem.

Public Properties

	Name	Description
	Associate (see page 302)	This is Associate, a member of class TAssociateItem.
	PopupTip (see page 302)	This is PopupTip, a member of class TAssociateItem.

5.1.3.2 TAssociateItem.Create Constructor

Pascal

```
constructor Create(APopupTip: TControl; AAssociate: TControl);
```

C++

```
__fastcall TAssociateItem(TControl * APopupTip, TControl * AAssociate);
```

Description

This is Create, a member of class TAssociateItem.

5.1.3.3 TAssociateItem.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAssociateItem();
```

Description

This is Destroy, a member of class TAssociateItem.

5.1.3.4 TAssociateItem Properties

The properties of the TAssociateItem class are listed here.

Public Properties

	Name	Description
	Associate (see page 302)	This is Associate, a member of class TAssociateItem.
	PopupTip (see page 302)	This is PopupTip, a member of class TAssociateItem.

5.1.3.4.1 TAssociateItem.Associate Property

Pascal

```
property Associate: TControl;
```

C++

```
__property TControl * Associate;
```

Description

This is Associate, a member of class TAssociateItem.

5.1.3.4.2 TAssociateItem.PopupTip Property

Pascal

```
property PopupTip: TControl;
```

C++

```
__property TControl * PopupTip;
```

Description

This is PopupTip, a member of class TAssociateItem.

5.1.4 TAssociateItemList Class

Class Hierarchy

Pascal

```
TAssociateItemList = class;
```

C++

```
class TAssociateItemList;
```

File

ScreenTips

Description

This is class ScreenTips.TAssociateItemList.

5.1.4.1 TAssociateItemList Members

The following tables list the members exposed by TAssociateItemList.

Public Methods

	Name	Description
	Add (see page 304)	This is Add, a member of class TAssociateItemList.
	Create (see page 303)	This is Create, a member of class TAssociateItemList.
	Destroy (see page 303)	This is Destroy, a member of class TAssociateItemList.
	Find (see page 304)	This is Find, a member of class TAssociateItemList.
	Get (see page 304)	This is Get, a member of class TAssociateItemList.
	Remove (see page 304)	This is Remove, a member of class TAssociateItemList.

5.1.4.2 TAssociateItemList.Create Constructor

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TAssociateItemList();
```

Description

This is Create, a member of class TAssociateItemList.

5.1.4.3 TAssociateItemList.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAssociateItemList();
```

Description

This is Destroy, a member of class TAssociateItemList.

5.1.4.4 TAssociateItemList Methods

The methods of the TAssociateItemList class are listed here.

Public Methods

	Name	Description
	Add (see page 304)	This is Add, a member of class TAssociateItemList.

	Find (see page 304)	This is Find, a member of class TAssociateItemList.
	Get (see page 304)	This is Get, a member of class TAssociateItemList.
	Remove (see page 304)	This is Remove, a member of class TAssociateItemList.

5.1.4.4.1 TAssociateItemList.Add Method

Pascal

```
procedure Add(Popup: TControl; Associate: TControl);
```

C++

```
__fastcall Add(TControl * Popup, TControl * Associate);
```

Description

This is Add, a member of class TAssociateItemList.

5.1.4.4.2 TAssociateItemList.Find Method

Pascal

```
function Find(Associate: TControl): Integer;
```

C++

```
__fastcall int Find(TControl * Associate);
```

Description

This is Find, a member of class TAssociateItemList.

5.1.4.4.3 TAssociateItemList.Get Method

Pascal

```
function Get(const Idx: Integer): TAssociateItem;
```

C++

```
__fastcall TAssociateItem Get(const int Idx);
```

Description

This is Get, a member of class TAssociateItemList.

5.1.4.4.4 TAssociateItemList.Remove Method

Pascal

```
procedure Remove(Associate: TControl);
```

C++

```
__fastcall Remove(TControl * Associate);
```

Description

This is Remove, a member of class TAssociateItemList.

5.1.5 TCustomScreenTipsManager Class

Class Hierarchy

Pascal

```
TCustomScreenTipsManager = class(TComponent);
```

C++

```
class TCustomScreenTipsManager : public TComponent;
```

File

ScreenTips

Description

This is class ScreenTips.TCustomScreenTipsManager.

5.1.5.1 TCustomScreenTipsManager Members

The following tables list the members exposed by TCustomScreenTipsManager.

Protected Methods

	Name	Description
	DoCreateScreenTip (see page 309)	This is DoCreateScreenTip, a member of class TCustomScreenTipsManager.
	DoDuplicateCreateError (see page 309)	This is DoDuplicateCreateError, a member of class TCustomScreenTipsManager.
	DoGetScreenTipClass (see page 309)	This is DoGetScreenTipClass, a member of class TCustomScreenTipsManager.
	DoScreenTipsLoaded (see page 309)	This is DoScreenTipsLoaded, a member of class TCustomScreenTipsManager.
	DoShow (see page 309)	This is DoShow, a member of class TCustomScreenTipsManager.
	DoShowScreenTip (see page 310)	This is DoShowScreenTip, a member of class TCustomScreenTipsManager.
	Loaded (see page 310)	Initializes the component after the form file has been read into memory.
	Notification (see page 311)	Forwards notification messages to all owned components.
	UpdateActionInfo (see page 312)	This is UpdateActionInfo, a member of class TCustomScreenTipsManager.

Public Events

	Name	Description
	OnCreateScreenTip (see page 315)	This is OnCreateScreenTip, a member of class TCustomScreenTipsManager.
	OnDuplicateCreateError (see page 315)	This is OnDuplicateCreateError, a member of class TCustomScreenTipsManager.
	OnGetScreenTipWinClass (see page 316)	This is OnGetScreenTipWinClass, a member of class TCustomScreenTipsManager.
	OnScreenTipsLoaded (see page 316)	This is OnScreenTipsLoaded, a member of class TCustomScreenTipsManager.
	OnShowScreenTip (see page 316)	This is OnShowScreenTip, a member of class TCustomScreenTipsManager.

Public Methods

	Name	Description
	AddPopup (see page 308)	This is AddPopup, a member of class TCustomScreenTipsManager.
	ClearScreenTips (see page 308)	This is ClearScreenTips, a member of class TCustomScreenTipsManager.
	Create (see page 306)	Allocates memory and constructs a safely initialized instance of a component.
	CreateScreenTip (see page 308)	This is CreateScreenTip, a member of class TCustomScreenTipsManager.
	Destroy (see page 307)	Disposes of the component and its owned components.
	GenerateScreenTips (see page 310)	This is GenerateScreenTips, a member of class TCustomScreenTipsManager.

	GetScreenTip (see page 310)	This is GetScreenTip, a member of class TCustomScreenTipsManager.
	RemovePopup (see page 311)	This is RemovePopup, a member of class TCustomScreenTipsManager.
	RemoveScreenTip (see page 312)	This is RemoveScreenTip, a member of class TCustomScreenTipsManager.
	UpdateOptions (see page 312)	This is UpdateOptions, a member of class TCustomScreenTipsManager.

Public Properties

	Name	Description
	BorderStyle (see page 313)	This is BorderStyle, a member of class TCustomScreenTipsManager.
	DisplayOffset (see page 313)	This is DisplayOffset, a member of class TCustomScreenTipsManager.
	Font (see page 313)	This is Font, a member of class TCustomScreenTipsManager.
	Footer (see page 313)	This is Footer, a member of class TCustomScreenTipsManager.
	FooterImage (see page 314)	This is FooterImage, a member of class TCustomScreenTipsManager.
	GradientEndColor (see page 314)	This is GradientEndColor, a member of class TCustomScreenTipsManager.
	GradientStartColor (see page 314)	This is GradientStartColor, a member of class TCustomScreenTipsManager.
	LinkedActionLists (see page 314)	This is LinkedActionLists, a member of class TCustomScreenTipsManager.
	Options (see page 314)	This is Options, a member of class TCustomScreenTipsManager.
	ScreenTips (see page 315)	This is ScreenTips, a member of class TCustomScreenTipsManager.

5.1.5.2 TCustomScreenTipsManager.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomScreenTipsManager(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Destroy

System::TObject::Free (see page 3372)

Owner

5.1.5.3 TCustomScreenTipsManager.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomScreenTipsManager();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

5.1.5.4 TCustomScreenTipsManager Methods

The methods of the TCustomScreenTipsManager class are listed here.

Protected Methods

	Name	Description
	DoCreateScreenTip (see page 309)	This is DoCreateScreenTip, a member of class TCustomScreenTipsManager.

	DoDuplicateCreateError (see page 309)	This is DoDuplicateCreateError, a member of class TCustomScreenTipsManager.
	DoGetScreenTipClass (see page 309)	This is DoGetScreenTipClass, a member of class TCustomScreenTipsManager.
	DoScreenTipsLoaded (see page 309)	This is DoScreenTipsLoaded, a member of class TCustomScreenTipsManager.
	DoShow (see page 309)	This is DoShow, a member of class TCustomScreenTipsManager.
	DoShowScreenTip (see page 310)	This is DoShowScreenTip, a member of class TCustomScreenTipsManager.
	Loaded (see page 310)	Initializes the component after the form file has been read into memory.
	Notification (see page 311)	Forwards notification messages to all owned components.
	UpdateActionInfo (see page 312)	This is UpdateActionInfo, a member of class TCustomScreenTipsManager.

Public Methods

	Name	Description
	AddPopup (see page 308)	This is AddPopup, a member of class TCustomScreenTipsManager.
	ClearScreenTips (see page 308)	This is ClearScreenTips, a member of class TCustomScreenTipsManager.
	CreateScreenTip (see page 308)	This is CreateScreenTip, a member of class TCustomScreenTipsManager.
	GenerateScreenTips (see page 310)	This is GenerateScreenTips, a member of class TCustomScreenTipsManager.
	GetScreenTip (see page 310)	This is GetScreenTip, a member of class TCustomScreenTipsManager.
	RemovePopup (see page 311)	This is RemovePopup, a member of class TCustomScreenTipsManager.
	RemoveScreenTip (see page 312)	This is RemoveScreenTip, a member of class TCustomScreenTipsManager.
	UpdateOptions (see page 312)	This is UpdateOptions, a member of class TCustomScreenTipsManager.

5.1.5.4.1 TCustomScreenTipsManager.AddPopup Method

Pascal

```
procedure AddPopup(AScreenTipPopup: TCustomControl);
```

C++

```
__fastcall AddPopup(TCustomControl AScreenTipPopup);
```

Description

This is AddPopup, a member of class TCustomScreenTipsManager.

5.1.5.4.2 TCustomScreenTipsManager.ClearScreenTips Method

Pascal

```
procedure ClearScreenTips;
```

C++

```
__fastcall ClearScreenTips();
```

Description

This is ClearScreenTips, a member of class TCustomScreenTipsManager.

5.1.5.4.3 TCustomScreenTipsManager.CreateScreenTip Method

Pascal

```
function CreateScreenTip(aAction: TBasicAction): TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem CreateScreenTip(TBasicAction aAction);
```

Description

This is CreateScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.4.4 TCustomScreenTipsManager.DoCreateScreenTip Method

Pascal

```
procedure DoCreateScreenTip(aItem: TScreenTipItem); virtual;
```

C++

```
virtual __fastcall DoCreateScreenTip(TScreenTipItem aItem);
```

Description

This is DoCreateScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.4.5 TCustomScreenTipsManager.DoDuplicateCreateError Method

Pascal

```
procedure DoDuplicateCreateError(aAction: TBasicAction); virtual;
```

C++

```
virtual __fastcall DoDuplicateCreateError(TBasicAction aAction);
```

Description

This is DoDuplicateCreateError, a member of class TCustomScreenTipsManager.

5.1.5.4.6 TCustomScreenTipsManager.DoGetScreenTipClass Method

Pascal

```
procedure DoGetScreenTipClass(var WindowClass: TScreenTipsWindowClass); virtual;
```

C++

```
virtual __fastcall DoGetScreenTipClass(TScreenTipsWindowClass WindowClass);
```

Description

This is DoGetScreenTipClass, a member of class TCustomScreenTipsManager.

5.1.5.4.7 TCustomScreenTipsManager.DoScreenTipsLoaded Method

Pascal

```
procedure DoScreenTipsLoaded; virtual;
```

C++

```
virtual __fastcall DoScreenTipsLoaded();
```

Description

This is DoScreenTipsLoaded, a member of class TCustomScreenTipsManager.

5.1.5.4.8 TCustomScreenTipsManager.DoShow Method

Pascal

```
procedure DoShow(Item: TScreenTipItem; var HintInfo: THintInfo); virtual;
```

C++

```
virtual __fastcall DoShow(TScreenTipItem Item, THintInfo HintInfo);
```

Description

This is DoShow, a member of class TCustomScreenTipsManager.

5.1.5.4.9 TCustomScreenTipsManager.DoShowScreenTip Method

Pascal

```
procedure DoShowScreenTip(Action: TBasicAction; Item: TScreenTipItem; var HintInfo:
THintInfo); virtual;
```

C++

```
virtual __fastcall DoShowScreenTip(TBasicAction Action, TScreenTipItem Item, THintInfo
HintInfo);
```

Description

This is DoShowScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.4.10 TCustomScreenTipsManager.GenerateScreenTips Method

Pascal

```
function GenerateScreenTips: Boolean;
```

C++

```
__fastcall Boolean GenerateScreenTips();
```

Description

This is GenerateScreenTips, a member of class TCustomScreenTipsManager.

5.1.5.4.11 TCustomScreenTipsManager.GetScreenTip Method

Pascal

```
function GetScreenTip(aAction: TBasicAction): TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem GetScreenTip(TBasicAction aAction);
```

Description

This is GetScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.4.12 TCustomScreenTipsManager.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

ComponentState

Create

TReader

5.1.5.4.13 TCustomScreenTipsManager.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

5.1.5.4.14 TCustomScreenTipsManager.RemovePopup Method

Pascal

```
procedure RemovePopup(AScreenTipPopup: TCustomControl);
```

C++

```
__fastcall RemovePopup(TCustomControl AScreenTipPopup);
```

Description

This is RemovePopup, a member of class TCustomScreenTipsManager.

5.1.5.4.15 TCustomScreenTipsManager.RemoveScreenTip Method

Pascal

```
function RemoveScreenTip(aScreenTip: TScreenTipItem): Boolean;
```

C++

```
__fastcall Boolean RemoveScreenTip(TScreenTipItem aScreenTip);
```

Description

This is RemoveScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.4.16 TCustomScreenTipsManager.UpdateActionInfo Method

Pascal

```
procedure UpdateActionInfo(aAction: TContainedAction; aTooltip: TScreenTipItem);
```

C++

```
__fastcall UpdateActionInfo(TContainedAction aAction, TScreenTipItem aTooltip);
```

Description

This is UpdateActionInfo, a member of class TCustomScreenTipsManager.

5.1.5.4.17 TCustomScreenTipsManager.UpdateOptions Method

Pascal

```
procedure UpdateOptions;
```

C++

```
__fastcall UpdateOptions();
```

Description

This is UpdateOptions, a member of class TCustomScreenTipsManager.

5.1.5.5 TCustomScreenTipsManager Properties

The properties of the TCustomScreenTipsManager class are listed here.

Public Properties

	Name	Description
	BorderStyle (see page 313)	This is BorderStyle, a member of class TCustomScreenTipsManager.
	DisplayOffset (see page 313)	This is DisplayOffset, a member of class TCustomScreenTipsManager.
	Font (see page 313)	This is Font, a member of class TCustomScreenTipsManager.
	Footer (see page 313)	This is Footer, a member of class TCustomScreenTipsManager.
	FooterImage (see page 314)	This is FooterImage, a member of class TCustomScreenTipsManager.

	GradientEndColor (see page 314)	This is GradientEndColor, a member of class TCustomScreenTipsManager.
	GradientStartColor (see page 314)	This is GradientStartColor, a member of class TCustomScreenTipsManager.
	LinkedActionLists (see page 314)	This is LinkedActionLists, a member of class TCustomScreenTipsManager.
	Options (see page 314)	This is Options, a member of class TCustomScreenTipsManager.
	ScreenTips (see page 315)	This is ScreenTips, a member of class TCustomScreenTipsManager.

5.1.5.5.1 TCustomScreenTipsManager.BorderStyle Property

Pascal

```
property BorderStyle: TScreenTipBorderStyle;
```

C++

```
__property TScreenTipBorderStyle BorderStyle;
```

Description

This is BorderStyle, a member of class TCustomScreenTipsManager.

5.1.5.5.2 TCustomScreenTipsManager.DisplayOffset Property

Pascal

```
property DisplayOffset: TDisplayOffset;
```

C++

```
__property TDisplayOffset DisplayOffset;
```

Description

This is DisplayOffset, a member of class TCustomScreenTipsManager.

5.1.5.5.3 TCustomScreenTipsManager.Font Property

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

This is Font, a member of class TCustomScreenTipsManager.

5.1.5.5.4 TCustomScreenTipsManager.Footer Property

Pascal

```
property Footer: string;
```

C++

```
__property UnicodeString Footer;
```

Description

This is Footer, a member of class TCustomScreenTipsManager.

5.1.5.5.5 TCustomScreenTipsManager.FooterImage Property

Pascal

```
property FooterImage: TPicture;
```

C++

```
__property TPicture FooterImage;
```

Description

This is FooterImage, a member of class TCustomScreenTipsManager.

5.1.5.5.6 TCustomScreenTipsManager.GradientEndColor Property

Pascal

```
property GradientEndColor: TColor;
```

C++

```
__property TColor GradientEndColor;
```

Description

This is GradientEndColor, a member of class TCustomScreenTipsManager.

5.1.5.5.7 TCustomScreenTipsManager.GradientStartColor Property

Pascal

```
property GradientStartColor: TColor;
```

C++

```
__property TColor GradientStartColor;
```

Description

This is GradientStartColor, a member of class TCustomScreenTipsManager.

5.1.5.5.8 TCustomScreenTipsManager.LinkedActionLists Property

Pascal

```
property LinkedActionLists: TActionListCollection;
```

C++

```
__property TActionListCollection LinkedActionLists;
```

Description

This is LinkedActionLists, a member of class TCustomScreenTipsManager.

5.1.5.5.9 TCustomScreenTipsManager.Options Property

Pascal

```
property Options: TScreenTipOptions;
```

C++

```
__property TScreenTipOptions Options;
```

Description

This is Options, a member of class TCustomScreenTipsManager.

5.1.5.5.10 TCustomScreenTipsManager.ScreenTips Property

Pascal

```
property ScreenTips: TScreenTipsCollection;
```

C++

```
__property TScreenTipsCollection ScreenTips;
```

Description

This is ScreenTips, a member of class TCustomScreenTipsManager.

5.1.5.6 TCustomScreenTipsManager Events

The events of the TCustomScreenTipsManager class are listed here.

Public Events

	Name	Description
	OnCreateScreenTip (see page 315)	This is OnCreateScreenTip, a member of class TCustomScreenTipsManager.
	OnDuplicateCreateError (see page 315)	This is OnDuplicateCreateError, a member of class TCustomScreenTipsManager.
	OnGetScreenTipWinClass (see page 316)	This is OnGetScreenTipWinClass, a member of class TCustomScreenTipsManager.
	OnScreenTipsLoaded (see page 316)	This is OnScreenTipsLoaded, a member of class TCustomScreenTipsManager.
	OnShowScreenTip (see page 316)	This is OnShowScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.6.1 TCustomScreenTipsManager.OnCreateScreenTip Event

Pascal

```
property OnCreateScreenTip: TCreateScreenTipEvent;
```

C++

```
__property TCreateScreenTipEvent OnCreateScreenTip;
```

Description

This is OnCreateScreenTip, a member of class TCustomScreenTipsManager.

5.1.5.6.2 TCustomScreenTipsManager.OnDuplicateCreateError Event

Pascal

```
property OnDuplicateCreateError: TDuplicateCreateErrorEvent;
```

C++

```
__property TDuplicateCreateErrorEvent OnDuplicateCreateError;
```

Description

This is OnDuplicateCreateError, a member of class TCustomScreenTipsManager.

5.1.5.6.3 TCustomScreenTipsManager.OnGetScreenTipWinClass Event

Pascal

```
property OnGetScreenTipWinClass: TScreenTipWinClass;
```

C++

```
__property TScreenTipWinClass OnGetScreenTipWinClass;
```

Description

This is OnGetScreenTipWinClass, a member of class TCustomScreenTipsManager.

5.1.5.6.4 TCustomScreenTipsManager.OnScreenTipsLoaded Event

Pascal

```
property OnScreenTipsLoaded: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnScreenTipsLoaded;
```

Description

This is OnScreenTipsLoaded, a member of class TCustomScreenTipsManager.

5.1.5.6.5 TCustomScreenTipsManager.OnShowScreenTip Event

Pascal

```
property OnShowScreenTip: TShowScreenTipEvent;
```

C++

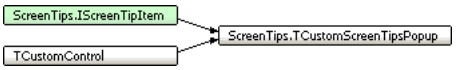
```
__property TShowScreenTipEvent OnShowScreenTip;
```

Description

This is OnShowScreenTip, a member of class TCustomScreenTipsManager.

5.1.6 TCustomScreenTipsPopup Class

Class Hierarchy



Pascal

```
TCustomScreenTipsPopup = class(TCustomControl, IScreenTipItem);
```

C++

```
class TCustomScreenTipsPopup : public TCustomControl, public IScreenTipItem;
```

File

ScreenTips

Description

This is class ScreenTips.TCustomScreenTipsPopup.

5.1.6.1 TCustomScreenTipsPopup Members

The following tables list the members exposed by TCustomScreenTipsPopup.

Protected Methods

	Name	Description
	LinkPopupToManager (see page 319)	This is LinkPopupToManager, a member of class TCustomScreenTipsPopup.
	Notification (see page 319)	Responds to notifications that components are being created or destroyed.
	Paint (see page 320)	Renders the image of a custom control.
	RemoveLinkToManager (see page 320)	This is RemoveLinkToManager, a member of class TCustomScreenTipsPopup.
	UpdateAssociateToManager (see page 320)	This is UpdateAssociateToManager, a member of class TCustomScreenTipsPopup.

Public Methods

	Name	Description
	Create (see page 317)	Creates an instance of TCustomControl.
	Destroy (see page 318)	Destroys an instance of TCustomControl.
	GetScreenTipItem (see page 319)	This is GetScreenTipItem, a member of class TCustomScreenTipsPopup.

Public Properties

	Name	Description
	Associate (see page 321)	This is Associate, a member of class TCustomScreenTipsPopup.
	Glyph (see page 321)	This is Glyph, a member of class TCustomScreenTipsPopup.
	PopupType (see page 321)	This is PopupType, a member of class TCustomScreenTipsPopup.
	ScreenTip (see page 322)	This is ScreenTip, a member of class TCustomScreenTipsPopup.
	ScreenTipManager (see page 322)	This is ScreenTipManager, a member of class TCustomScreenTipsPopup.
	Transparent (see page 324)	This is Transparent, a member of class TCustomScreenTipsPopup.

Published Properties

	Name	Description
	ShowHint (see page 322)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

5.1.6.2 TCustomScreenTipsPopup.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomScreenTipsPopup(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create

Destroy

Canvas

Owner

5.1.6.3 TCustomScreenTipsPopup.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomScreenTipsPopup();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

5.1.6.4 TCustomScreenTipsPopup Methods

The methods of the TCustomScreenTipsPopup class are listed here.

Protected Methods

	Name	Description
	LinkPopupToManager (see page 319)	This is LinkPopupToManager, a member of class TCustomScreenTipsPopup.
	Notification (see page 319)	Responds to notifications that components are being created or destroyed.
	Paint (see page 320)	Renders the image of a custom control.
	RemoveLinkToManager (see page 320)	This is RemoveLinkToManager, a member of class TCustomScreenTipsPopup.
	UpdateAssociateToManager (see page 320)	This is UpdateAssociateToManager, a member of class TCustomScreenTipsPopup.

Public Methods

	Name	Description
	GetScreenTipItem (see page 319)	This is GetScreenTipItem, a member of class TCustomScreenTipsPopup.

5.1.6.4.1 TCustomScreenTipsPopup.GetScreenTipItem Method

Pascal

```
function GetScreenTipItem: TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem GetScreenTipItem();
```

Description

This is GetScreenTipItem, a member of class TCustomScreenTipsPopup.

5.1.6.4.2 TCustomScreenTipsPopup.LinkPopupToManager Method

Pascal

```
procedure LinkPopupToManager; virtual;
```

C++

```
virtual __fastcall LinkPopupToManager();
```

Description

This is LinkPopupToManager, a member of class TCustomScreenTipsPopup.

5.1.6.4.3 TCustomScreenTipsPopup.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware

controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

5.1.6.4.4 TCustomScreenTipsPopup.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

5.1.6.4.5 TCustomScreenTipsPopup.RemoveLinkToManager Method

Pascal

```
procedure RemoveLinkToManager; virtual;
```

C++

```
virtual __fastcall RemoveLinkToManager();
```

Description

This is RemoveLinkToManager, a member of class TCustomScreenTipsPopup.

5.1.6.4.6 TCustomScreenTipsPopup.UpdateAssociateToManager Method

Pascal

```
procedure UpdateAssociateToManager; virtual;
```

C++

```
virtual __fastcall UpdateAssociateToManager();
```

Description

This is UpdateAssociateToManager, a member of class TCustomScreenTipsPopup.

5.1.6.5 TCustomScreenTipsPopup Properties

The properties of the TCustomScreenTipsPopup class are listed here.

Public Properties

	Name	Description
	Associate (see page 321)	This is Associate, a member of class TCustomScreenTipsPopup.
	Glyph (see page 321)	This is Glyph, a member of class TCustomScreenTipsPopup.
	PopupType (see page 321)	This is PopupType, a member of class TCustomScreenTipsPopup.
	ScreenTip (see page 322)	This is ScreenTip, a member of class TCustomScreenTipsPopup.
	ScreenTipManager (see page 322)	This is ScreenTipManager, a member of class TCustomScreenTipsPopup.
	Transparent (see page 324)	This is Transparent, a member of class TCustomScreenTipsPopup.

Published Properties

	Name	Description
	ShowHint (see page 322)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

5.1.6.5.1 TCustomScreenTipsPopup.Associate Property

Pascal

```
property Associate: TControl;
```

C++

```
__property TControl * Associate;
```

Description

This is Associate, a member of class TCustomScreenTipsPopup.

5.1.6.5.2 TCustomScreenTipsPopup.Glyph Property

Pascal

```
property Glyph: TPicture;
```

C++

```
__property TPicture Glyph;
```

Description

This is Glyph, a member of class TCustomScreenTipsPopup.

5.1.6.5.3 TCustomScreenTipsPopup.PopupType Property

Pascal

```
property PopupType: TScreenTipPopupType;
```

C++

```
__property TScreenTipPopupType PopupType;
```

Description

This is PopupType, a member of class TCustomScreenTipsPopup.

5.1.6.5.4 TCustomScreenTipsPopup.ScreenTip Property

Pascal

```
property ScreenTip: TScreenTipItem;
```

C++

```
__property TScreenTipItem ScreenTip;
```

Description

This is ScreenTip, a member of class TCustomScreenTipsPopup.

5.1.6.5.5 TCustomScreenTipsPopup.ScreenTipManager Property

Pascal

```
property ScreenTipManager: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTipManager;
```

Description

This is ScreenTipManager, a member of class TCustomScreenTipsPopup.

5.1.6.5.6 TCustomScreenTipsPopup.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
```

```
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

5.1.6.5.7 TCustomScreenTipsPopup.Transparent Property

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

This is Transparent, a member of class TCustomScreenTipsPopup.

5.1.7 TDisplayOffset Class

Class Hierarchy

Pascal

```
TDisplayOffset = class(TPersistent);
```

C++

```
class TDisplayOffset : public TPersistent;
```

File

ScreenTips

Description

This is class ScreenTips.TDisplayOffset.

5.1.7.1 TDisplayOffset Members

The following tables list the members exposed by TDisplayOffset.

Public Methods

	Name	Description
	Create (see page 324)	Constructs an object and initializes its data before the object is first used.

Published Properties

	Name	Description
	Control (see page 325)	This is Control, a member of class TDisplayOffset.
	X (see page 325)	This is X, a member of class TDisplayOffset.
	Y (see page 325)	This is Y, a member of class TDisplayOffset.

5.1.7.2 TDisplayOffset.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TDisplayOffset();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

5.1.7.3 TDisplayOffset Properties

The properties of the TDisplayOffset class are listed here.

Published Properties

	Name	Description
	Control (see page 325)	This is Control, a member of class TDisplayOffset.
	X (see page 325)	This is X, a member of class TDisplayOffset.
	Y (see page 325)	This is Y, a member of class TDisplayOffset.

5.1.7.3.1 TDisplayOffset.Control Property

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

This is Control, a member of class TDisplayOffset.

5.1.7.3.2 TDisplayOffset.X Property

Pascal

```
property X: Integer;
```

C++

```
__property int X;
```

Description

This is X, a member of class TDisplayOffset.

5.1.7.3.3 TDisplayOffset.Y Property

Pascal

```
property Y: Integer;
```

C++

```
__property int Y;
```

Description

This is Y, a member of class TDisplayOffset.

5.1.8 TScreenTipBorderStyle Class

Class Hierarchy

Pascal

```
TScreenTipBorderStyle = class(TPersistent);
```

C++

```
class TScreenTipBorderStyle : public TPersistent;
```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipBorderStyle.

5.1.8.1 TScreenTipBorderStyle Members

The following tables list the members exposed by TScreenTipBorderStyle.

Public Methods

	Name	Description
	Create (see page 326)	Constructs an object and initializes its data before the object is first used.

Published Properties

	Name	Description
	Color (see page 327)	This is Color, a member of class TScreenTipBorderStyle.
	CornerSize (see page 327)	This is CornerSize, a member of class TScreenTipBorderStyle.
	Style (see page 327)	This is Style, a member of class TScreenTipBorderStyle.

5.1.8.2 TScreenTipBorderStyle.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScreenTipBorderStyle();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The

System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

5.1.8.3 TScreenTipBorderStyle Properties

The properties of the TScreenTipBorderStyle class are listed here.

Published Properties

	Name	Description
	Color (see page 327)	This is Color, a member of class TScreenTipBorderStyle.
	CornerSize (see page 327)	This is CornerSize, a member of class TScreenTipBorderStyle.
	Style (see page 327)	This is Style, a member of class TScreenTipBorderStyle.

5.1.8.3.1 TScreenTipBorderStyle.Color Property

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

This is Color, a member of class TScreenTipBorderStyle.

5.1.8.3.2 TScreenTipBorderStyle.CornerSize Property

Pascal

```
property CornerSize: Integer;
```

C++

```
__property int CornerSize;
```

Description

This is CornerSize, a member of class TScreenTipBorderStyle.

5.1.8.3.3 TScreenTipBorderStyle.Style Property

Pascal

```
property Style: TTipBorderStyle;
```

C++

```
__property TTipBorderStyle Style;
```

Description

This is Style, a member of class TScreenTipBorderStyle.

5.1.9 TScreenTipItem Class

Class Hierarchy

Pascal

```
TScreenTipItem = class(TCollectionItem);
```

C++

```
class TScreenTipItem : public TCollectionItem;
```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipItem.

5.1.9.1 TScreenTipItem Members

The following tables list the members exposed by TScreenTipItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 330)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 330)	Copies the contents of another, similar object.
	Create (see page 329)	Creates and initializes a TCollectionItem instance.
	Destroy (see page 329)	Destroys the TCollectionItem instance and frees its memory.
	IsEnabled (see page 331)	This is IsEnabled, a member of class TScreenTipItem.
	SetManager (see page 331)	This is SetManager, a member of class TScreenTipItem.

Public Properties

	Name	Description
	Height (see page 333)	This is Height, a member of class TScreenTipItem.
	Width (see page 334)	This is Width, a member of class TScreenTipItem.

Published Properties

	Name	Description
	Action (see page 332)	This is Action, a member of class TScreenTipItem.
	Description (see page 332)	This is Description, a member of class TScreenTipItem.
	DisabledDescription (see page 332)	This is DisabledDescription, a member of class TScreenTipItem.
	DisabledHeader (see page 332)	This is DisabledHeader, a member of class TScreenTipItem.
	Header (see page 332)	This is Header, a member of class TScreenTipItem.
	Image (see page 333)	This is Image, a member of class TScreenTipItem.
	Manager (see page 333)	This is Manager, a member of class TScreenTipItem.
	ShowFooter (see page 333)	This is ShowFooter, a member of class TScreenTipItem.
	ShowImage (see page 334)	This is ShowImage, a member of class TScreenTipItem.

5.1.9.2 TScreenTipItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TScreenTipItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add

Collection

5.1.9.3 TScreenTipItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScreenTipItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear

Delete

System::TObject::Free (see page 3372)

5.1.9.4 TScreenTipItem Methods

The methods of the TScreenTipItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 330)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 330)	Copies the contents of another, similar object.
	IsEnabled (see page 331)	This is IsEnabled, a member of class TScreenTipItem.
	SetManager (see page 331)	This is SetManager, a member of class TScreenTipItem.

5.1.9.4.1 TScreenTipItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError (see page 3919)

5.1.9.4.2 TScreenTipItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName

GetNamePath

5.1.9.4.3 TScreenTipItem.IsEnabled Method

Pascal

```
function IsEnabled: Boolean;
```

C++

```
__fastcall Boolean IsEnabled();
```

Description

This is IsEnabled, a member of class TScreenTipItem.

5.1.9.4.4 TScreenTipItem.SetManager Method

Pascal

```
procedure SetManager(AManager: TCustomScreenTipsManager);
```

C++

```
__fastcall SetManager(TCustomScreenTipsManager AManager);
```

Description

This is SetManager, a member of class TScreenTipItem.

5.1.9.5 TScreenTipItem Properties

The properties of the TScreenTipItem class are listed here.

Public Properties

	Name	Description
	Height (see page 333)	This is Height, a member of class TScreenTipItem.
	Width (see page 334)	This is Width, a member of class TScreenTipItem.

Published Properties

	Name	Description
	Action (see page 332)	This is Action, a member of class TScreenTipItem.
	Description (see page 332)	This is Description, a member of class TScreenTipItem.
	DisabledDescription (see page 332)	This is DisabledDescription, a member of class TScreenTipItem.
	DisabledHeader (see page 332)	This is DisabledHeader, a member of class TScreenTipItem.
	Header (see page 332)	This is Header, a member of class TScreenTipItem.
	Image (see page 333)	This is Image, a member of class TScreenTipItem.
R	Manager (see page 333)	This is Manager, a member of class TScreenTipItem.
	ShowFooter (see page 333)	This is ShowFooter, a member of class TScreenTipItem.
	ShowImage (see page 334)	This is ShowImage, a member of class TScreenTipItem.

5.1.9.5.1 TScreenTipItem.Action Property

Pascal

```
property Action: TContainedAction;
```

C++

```
__property TContainedAction Action;
```

Description

This is Action, a member of class TScreenTipItem.

5.1.9.5.2 TScreenTipItem.Description Property

Pascal

```
property Description: TStrings;
```

C++

```
__property TStrings Description;
```

Description

This is Description, a member of class TScreenTipItem.

5.1.9.5.3 TScreenTipItem.DisabledDescription Property

Pascal

```
property DisabledDescription: TStrings;
```

C++

```
__property TStrings DisabledDescription;
```

Description

This is DisabledDescription, a member of class TScreenTipItem.

5.1.9.5.4 TScreenTipItem.DisabledHeader Property

Pascal

```
property DisabledHeader: string;
```

C++

```
__property UnicodeString DisabledHeader;
```

Description

This is DisabledHeader, a member of class TScreenTipItem.

5.1.9.5.5 TScreenTipItem.Header Property

Pascal

```
property Header: string;
```

C++

```
__property UnicodeString Header;
```

Description

This is Header, a member of class TScreenTipItem.

5.1.9.5.6 TScreenTipItem.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class TScreenTipItem.

5.1.9.5.7 TScreenTipItem.Image Property

Pascal

```
property Image: TPicture;
```

C++

```
__property TPicture Image;
```

Description

This is Image, a member of class TScreenTipItem.

5.1.9.5.8 TScreenTipItem.Manager Property

Pascal

```
property Manager: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager Manager;
```

Description

This is Manager, a member of class TScreenTipItem.

5.1.9.5.9 TScreenTipItem.ShowFooter Property

Pascal

```
property ShowFooter: Boolean;
```

C++

```
__property Boolean ShowFooter;
```

Description

This is ShowFooter, a member of class TScreenTipItem.

5.1.9.5.10 TScreenTipItem.ShowImage Property

Pascal

```
property ShowImage: Boolean;
```

C++

```
__property Boolean ShowImage;
```

Description

This is ShowImage, a member of class TScreenTipItem.

5.1.9.5.11 TScreenTipItem.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class TScreenTipItem.

5.1.10 TScreenTipsCollection Class

Class Hierarchy

Pascal

```
TScreenTipsCollection = class(TCollection);
```

C++

```
class TScreenTipsCollection : public TCollection;
```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipsCollection.

5.1.10.1 TScreenTipsCollection Members

The following tables list the members exposed by TScreenTipsCollection.

Protected Methods

	Name	Description
	GetOwner (see page 336)	Returns the owner of an object.

Public Methods

	Name	Description
	Add (see page 335)	Creates a new TCollectionItem instance and adds it to the Items array.
	Create (see page 335)	This is Create, a member of class TScreenTipsCollection.
	Insert (see page 336)	Creates a new TCollectionItem instance and adds it to the Items array.

Public Properties

	Name	Description
	Items (see page 337)	Lists the items in the collection.

5.1.10.2 TScreenTipsCollection.Create Constructor

Pascal

```
constructor Create(Manager: TCustomScreenTipsManager);
```

C++

```
__fastcall TScreenTipsCollection(TCustomScreenTipsManager Manager);
```

Description

This is Create, a member of class TScreenTipsCollection.

5.1.10.3 TScreenTipsCollection Methods

The methods of the TScreenTipsCollection class are listed here.

Protected Methods

	Name	Description
	GetOwner (see page 336)	Returns the owner of an object.

Public Methods

	Name	Description
	Add (see page 335)	Creates a new TCollectionItem instance and adds it to the Items array.
	Insert (see page 336)	Creates a new TCollectionItem instance and adds it to the Items array.

5.1.10.3.1 TScreenTipsCollection.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

See Also

Items

Insert

Create

Delete

5.1.10.3.2 TScreenTipsCollection.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath

TCollection

TComponent

Owner

5.1.10.3.3 TScreenTipsCollection.Insert Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Insert(Index: Integer): TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem Insert(int Index);
```

Description

Call Insert to add a new item at a specified position in the collection. Existing items (starting from the specified position) are moved up in the Items array.

Insert returns the new collection item.

Add

Items

5.1.10.4 TScreenTipsCollection Properties

The properties of the TScreenTipsCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 337)	Lists the items in the collection.

5.1.10.4.1 TScreenTipsCollection.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TScreenTipItem;
```

C++

```
__property TScreenTipItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the `Index` parameter corresponds to the `Index` property of TCollectionItem. It represents the position of the item in the collection.

```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipsManager.

5.1.11.1 TScreenTipsManager Members

The following tables list the members exposed by TScreenTipsManager.

Protected Methods

	Name	Description
	DoCreateScreenTip (see page 309)	This is DoCreateScreenTip, a member of class TCustomScreenTipsManager.
	DoDuplicateCreateError (see page 309)	This is DoDuplicateCreateError, a member of class TCustomScreenTipsManager.
	DoGetScreenTipClass (see page 309)	This is DoGetScreenTipClass, a member of class TCustomScreenTipsManager.
	DoScreenTipsLoaded (see page 309)	This is DoScreenTipsLoaded, a member of class TCustomScreenTipsManager.
	DoShow (see page 309)	This is DoShow, a member of class TCustomScreenTipsManager.
	DoShowScreenTip (see page 310)	This is DoShowScreenTip, a member of class TCustomScreenTipsManager.
	Loaded (see page 310)	Initializes the component after the form file has been read into memory.
	Notification (see page 311)	Forwards notification messages to all owned components.
	UpdateActionInfo (see page 312)	This is UpdateActionInfo, a member of class TCustomScreenTipsManager.

Public Methods

	Name	Description
	AddPopup (see page 308)	This is AddPopup, a member of class TCustomScreenTipsManager.
	ClearScreenTips (see page 308)	This is ClearScreenTips, a member of class TCustomScreenTipsManager.
	Create (see page 306)	Allocates memory and constructs a safely initialized instance of a component.
	CreateScreenTip (see page 308)	This is CreateScreenTip, a member of class TCustomScreenTipsManager.
	Destroy (see page 307)	Disposes of the component and its owned components.
	GenerateScreenTips (see page 310)	This is GenerateScreenTips, a member of class TCustomScreenTipsManager.
	GetScreenTip (see page 310)	This is GetScreenTip, a member of class TCustomScreenTipsManager.
	RemovePopup (see page 311)	This is RemovePopup, a member of class TCustomScreenTipsManager.
	RemoveScreenTip (see page 312)	This is RemoveScreenTip, a member of class TCustomScreenTipsManager.
	UpdateOptions (see page 312)	This is UpdateOptions, a member of class TCustomScreenTipsManager.

Published Events

	Name	Description
	OnCreateScreenTip (see page 341)	This is OnCreateScreenTip, a member of class TScreenTipsManager.
	OnDuplicateCreateError (see page 342)	This is OnDuplicateCreateError, a member of class TScreenTipsManager.
	OnGetScreenTipWinClass (see page 342)	This is OnGetScreenTipWinClass, a member of class TScreenTipsManager.
	OnScreenTipsLoaded (see page 342)	This is OnScreenTipsLoaded, a member of class TScreenTipsManager.
	OnShowScreenTip (see page 342)	This is OnShowScreenTip, a member of class TScreenTipsManager.

Published Properties

	Name	Description
	BorderStyle (see page 339)	This is BorderStyle, a member of class TScreenTipsManager.
	DisplayOffset (see page 339)	This is DisplayOffset, a member of class TScreenTipsManager.
	Font (see page 339)	This is Font, a member of class TScreenTipsManager.
	Footer (see page 340)	This is Footer, a member of class TScreenTipsManager.
	FooterImage (see page 340)	This is FooterImage, a member of class TScreenTipsManager.
	GradientEndColor (see page 340)	This is GradientEndColor, a member of class TScreenTipsManager.
	GradientStartColor (see page 340)	This is GradientStartColor, a member of class TScreenTipsManager.
	LinkedActionLists (see page 340)	This is LinkedActionLists, a member of class TScreenTipsManager.
	Options (see page 341)	This is Options, a member of class TScreenTipsManager.
	ScreenTips (see page 341)	This is ScreenTips, a member of class TScreenTipsManager.

5.1.11.2 TScreenTipsManager Properties

The properties of the TScreenTipsManager class are listed here.

Published Properties

	Name	Description
	BorderStyle (see page 339)	This is BorderStyle, a member of class TScreenTipsManager.
	DisplayOffset (see page 339)	This is DisplayOffset, a member of class TScreenTipsManager.
	Font (see page 339)	This is Font, a member of class TScreenTipsManager.
	Footer (see page 340)	This is Footer, a member of class TScreenTipsManager.
	FooterImage (see page 340)	This is FooterImage, a member of class TScreenTipsManager.
	GradientEndColor (see page 340)	This is GradientEndColor, a member of class TScreenTipsManager.
	GradientStartColor (see page 340)	This is GradientStartColor, a member of class TScreenTipsManager.
	LinkedActionLists (see page 340)	This is LinkedActionLists, a member of class TScreenTipsManager.
	Options (see page 341)	This is Options, a member of class TScreenTipsManager.
	ScreenTips (see page 341)	This is ScreenTips, a member of class TScreenTipsManager.

5.1.11.2.1 TScreenTipsManager.BorderStyle Property

Pascal

```
property BorderStyle: TScreenTipBorderStyle;
```

C++

```
__property TScreenTipBorderStyle BorderStyle;
```

Description

This is BorderStyle, a member of class TScreenTipsManager.

5.1.11.2.2 TScreenTipsManager.DisplayOffset Property

Pascal

```
property DisplayOffset: TDisplayOffset;
```

C++

```
__property TDisplayOffset DisplayOffset;
```

Description

This is DisplayOffset, a member of class TScreenTipsManager.

5.1.11.2.3 TScreenTipsManager.Font Property

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

This is Font, a member of class TScreenTipsManager.

5.1.11.2.4 TScreenTipsManager.Footer Property

Pascal

```
property Footer: string;
```

C++

```
__property UnicodeString Footer;
```

Description

This is Footer, a member of class TScreenTipsManager.

5.1.11.2.5 TScreenTipsManager.FooterImage Property

Pascal

```
property FooterImage: TPicture;
```

C++

```
__property TPicture FooterImage;
```

Description

This is FooterImage, a member of class TScreenTipsManager.

5.1.11.2.6 TScreenTipsManager.GradientEndColor Property

Pascal

```
property GradientEndColor: TColor;
```

C++

```
__property TColor GradientEndColor;
```

Description

This is GradientEndColor, a member of class TScreenTipsManager.

5.1.11.2.7 TScreenTipsManager.GradientStartColor Property

Pascal

```
property GradientStartColor: TColor;
```

C++

```
__property TColor GradientStartColor;
```

Description

This is GradientStartColor, a member of class TScreenTipsManager.

5.1.11.2.8 TScreenTipsManager.LinkedActionLists Property

Pascal

```
property LinkedActionLists: TActionListCollection;
```

C++

```
__property TActionListCollection LinkedActionLists;
```

Description

This is LinkedActionLists, a member of class TScreenTipsManager.

5.1.11.2.9 TScreenTipsManager.Options Property

Pascal

```
property Options: TScreenTipOptions;
```

C++

```
__property TScreenTipOptions Options;
```

Description

This is Options, a member of class TScreenTipsManager.

5.1.11.2.10 TScreenTipsManager.ScreenTips Property

Pascal

```
property ScreenTips: TScreenTipsCollection;
```

C++

```
__property TScreenTipsCollection ScreenTips;
```

Description

This is ScreenTips, a member of class TScreenTipsManager.

5.1.11.3 TScreenTipsManager Events

The events of the TScreenTipsManager class are listed here.

Published Events

	Name	Description
	OnCreateScreenTip (see page 341)	This is OnCreateScreenTip, a member of class TScreenTipsManager.
	OnDuplicateCreateError (see page 342)	This is OnDuplicateCreateError, a member of class TScreenTipsManager.
	OnGetScreenTipWinClass (see page 342)	This is OnGetScreenTipWinClass, a member of class TScreenTipsManager.
	OnScreenTipsLoaded (see page 342)	This is OnScreenTipsLoaded, a member of class TScreenTipsManager.
	OnShowScreenTip (see page 342)	This is OnShowScreenTip, a member of class TScreenTipsManager.

5.1.11.3.1 TScreenTipsManager.OnCreateScreenTip Event

Pascal

```
property OnCreateScreenTip: TCreateScreenTipEvent;
```

C++

```
__property TCreateScreenTipEvent OnCreateScreenTip;
```

Description

This is OnCreateScreenTip, a member of class TScreenTipsManager.

5.1.11.3.2 TScreenTipsManager.OnDuplicateCreateError Event

Pascal

```
property OnDuplicateCreateError: TDuplicateCreateErrorEvent;
```

C++

```
__property TDuplicateCreateErrorEvent OnDuplicateCreateError;
```

Description

This is OnDuplicateCreateError, a member of class TScreenTipsManager.

5.1.11.3.3 TScreenTipsManager.OnGetScreenTipWinClass Event

Pascal

```
property OnGetScreenTipWinClass: TScreenTipWinClass;
```

C++

```
__property TScreenTipWinClass OnGetScreenTipWinClass;
```

Description

This is OnGetScreenTipWinClass, a member of class TScreenTipsManager.

5.1.11.3.4 TScreenTipsManager.OnScreenTipsLoaded Event

Pascal

```
property OnScreenTipsLoaded: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnScreenTipsLoaded;
```

Description

This is OnScreenTipsLoaded, a member of class TScreenTipsManager.

5.1.11.3.5 TScreenTipsManager.OnShowScreenTip Event

Pascal

```
property OnShowScreenTip: TShowScreenTipEvent;
```

C++

```
__property TShowScreenTipEvent OnShowScreenTip;
```

Description

This is OnShowScreenTip, a member of class TScreenTipsManager.

5.1.12 TScreenTipsPopup Class

Class Hierarchy

Pascal

```
TScreenTipsPopup = class(TCustomScreenTipsPopup);
```

C++

```
class TScreenTipsPopup : public TCustomScreenTipsPopup;
```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipsPopup.

5.1.12.1 TScreenTipsPopup Members

The following tables list the members exposed by TScreenTipsPopup.

Protected Methods

	Name	Description
	LinkPopupToManager (see page 319)	This is LinkPopupToManager, a member of class TCustomScreenTipsPopup.
	Notification (see page 319)	Responds to notifications that components are being created or destroyed.
	Paint (see page 320)	Renders the image of a custom control.
	RemoveLinkToManager (see page 320)	This is RemoveLinkToManager, a member of class TCustomScreenTipsPopup.
	UpdateAssociateToManager (see page 320)	This is UpdateAssociateToManager, a member of class TCustomScreenTipsPopup.

Public Methods

	Name	Description
	Create (see page 317)	Creates an instance of TCustomControl.
	Destroy (see page 318)	Destroys an instance of TCustomControl.
	GetScreenTipItem (see page 362)	This is GetScreenTipItem, a member of class IScreenTipItem.
	GetScreenTipItem (see page 319)	This is GetScreenTipItem, a member of class TCustomScreenTipsPopup.

Published Properties

	Name	Description
	Align (see page 344)	Determines how the control aligns within its container (parent control).
	Anchors (see page 347)	Specifies how the control is anchored to its parent.
	Associate (see page 348)	This is Associate, a member of class TScreenTipsPopup.
	Glyph (see page 348)	This is Glyph, a member of class TScreenTipsPopup.
	PopupType (see page 348)	This is PopupType, a member of class TScreenTipsPopup.
	ScreenTip (see page 349)	This is ScreenTip, a member of class TScreenTipsPopup.
	ScreenTipManager (see page 349)	This is ScreenTipManager, a member of class TScreenTipsPopup.
	ShowHint (see page 322)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Transparent (see page 349)	This is Transparent, a member of class TScreenTipsPopup.

	Visible (see page 349)	Determines whether the component appears onscreen.

5.1.12.2 TScreenTipsPopup Properties

The properties of the TScreenTipsPopup class are listed here.

Published Properties

	Name	Description
	Align (see page 344)	Determines how the control aligns within its container (parent control).
	Anchors (see page 347)	Specifies how the control is anchored to its parent.
	Associate (see page 348)	This is Associate, a member of class TScreenTipsPopup.
	Glyph (see page 348)	This is Glyph, a member of class TScreenTipsPopup.
	PopupType (see page 348)	This is PopupType, a member of class TScreenTipsPopup.
	ScreenTip (see page 349)	This is ScreenTip, a member of class TScreenTipsPopup.
	ScreenTipManager (see page 349)	This is ScreenTipManager, a member of class TScreenTipsPopup.
	Transparent (see page 349)	This is Transparent, a member of class TScreenTipsPopup.
	Visible (see page 349)	Determines whether the component appears onscreen.

5.1.12.2.1 TScreenTipsPopup.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
```

```
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
```

```
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
  with ProgressBar do
  begin
    Parent := Self;
    Align := alBottom;
```

```
    end;
  end;
  {
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  }
  var
    PageControl1: TPageControl;

Parent

Anchors

5.1.12.2.2 TScreenTipsPopup.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Align

5.1.12.2.3 TScreenTipsPopup.Associate Property

Pascal

```
property Associate: TControl;
```

C++

```
__property TControl * Associate;
```

Description

This is Associate, a member of class TScreenTipsPopup.

5.1.12.2.4 TScreenTipsPopup.Glyph Property

Pascal

```
property Glyph: TPicture;
```

C++

```
__property TPicture Glyph;
```

Description

This is Glyph, a member of class TScreenTipsPopup.

5.1.12.2.5 TScreenTipsPopup.PopupType Property

Pascal

```
property PopupType: TScreenTipPopupType;
```

C++

```
__property TScreenTipPopupType PopupType;
```

Description

This is PopupType, a member of class TScreenTipsPopup.

5.1.12.2.6 TScreenTipsPopup.ScreenTip Property

Pascal

```
property ScreenTip: TScreenTipItem;
```

C++

```
__property TScreenTipItem ScreenTip;
```

Description

This is ScreenTip, a member of class TScreenTipsPopup.

5.1.12.2.7 TScreenTipsPopup.ScreenTipManager Property

Pascal

```
property ScreenTipManager: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTipManager;
```

Description

This is ScreenTipManager, a member of class TScreenTipsPopup.

5.1.12.2.8 TScreenTipsPopup.Transparent Property

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

This is Transparent, a member of class TScreenTipsPopup.

5.1.12.2.9 TScreenTipsPopup.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;

5.1.13 TScreenTipsWindow Class

Class Hierarchy

Pascal

```
TScreenTipsWindow = class(THintWindow);
```

C++

```
class TScreenTipsWindow : public THintWindow;
```

File

ScreenTips

Description

This is class ScreenTips.TScreenTipsWindow.

5.1.13.1 TScreenTipsWindow Members

The following tables list the members exposed by TScreenTipsWindow.

Protected Methods

	Name	Description
	CMMouseenter (see page 353)	This is CMMouseenter, a member of class TScreenTipsWindow.
	CMMouseLeave (see page 354)	This is CMMouseLeave, a member of class TScreenTipsWindow.
V	CreateParams (see page 354)	Initializes a window-creation parameter data structure.
V	CreateRoundedStyle (see page 354)	This is CreateRoundedStyle, a member of class TScreenTipsWindow.
V	CreateTipBorderStyle (see page 355)	This is CreateTipBorderStyle, a member of class TScreenTipsWindow.
V	CreateWnd (see page 355)	Creates the underlying window.
V	DrawBackground (see page 355)	This is DrawBackground, a member of class TScreenTipsWindow.
V	DrawBorder (see page 356)	This is DrawBorder, a member of class TScreenTipsWindow.
V	DrawFooter (see page 356)	This is DrawFooter, a member of class TScreenTipsWindow.
V	DrawHeader (see page 356)	This is DrawHeader, a member of class TScreenTipsWindow.
V	Paint (see page 356)	Renders the image of a custom control.
	WMNCHitTest (see page 357)	This is WMNCHitTest, a member of class TScreenTipsWindow.

Public Methods

	Name	Description
V	ActivateToolTip (see page 353)	This is ActivateToolTip, a member of class TScreenTipsWindow.
V	Create (see page 352)	Creates and initializes an instance of THintWindow.
V	Destroy (see page 352)	Destroys an instance of TCustomControl.

	HideHint (see page 356)	This is HideHint, a member of class TScreenTipsWindow.

Public Properties

	Name	Description
R	ActiveItem (see page 357)	This is ActiveItem, a member of class TScreenTipsWindow.
	Body (see page 358)	This is Body, a member of class TScreenTipsWindow.
	CornerSize (see page 358)	This is CornerSize, a member of class TScreenTipsWindow.
	Footer (see page 358)	This is Footer, a member of class TScreenTipsWindow.
	FooterImage (see page 358)	This is FooterImage, a member of class TScreenTipsWindow.
	GradientEndColor (see page 359)	This is GradientEndColor, a member of class TScreenTipsWindow.
	GradientStartColor (see page 359)	This is GradientStartColor, a member of class TScreenTipsWindow.
	HintControl (see page 359)	This is HintControl, a member of class TScreenTipsWindow.
	Image (see page 359)	This is Image, a member of class TScreenTipsWindow.
	TipBorderStyle (see page 359)	This is TipBorderStyle, a member of class TScreenTipsWindow.

5.1.13.2 TScreenTipsWindow.Create Constructor

Creates and initializes an instance of THintWindow.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TScreenTipsWindow(TComponent * AOwner);
```

Description

Call Create to instantiate a hint window at runtime. Hint windows activated by the application in response to the ShowHint property of a control are created automatically.

See Also

ActivateHint

ShowHint

5.1.13.3 TScreenTipsWindow.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScreenTipsWindow();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a

descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

5.1.13.4 TScreenTipsWindow Methods

The methods of the TScreenTipsWindow class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 353)	This is CMMouseenter, a member of class TScreenTipsWindow.
	CMMouseLeave (see page 354)	This is CMMouseLeave, a member of class TScreenTipsWindow.
V	CreateParams (see page 354)	Initializes a window-creation parameter data structure.
V	CreateRoundedStyle (see page 354)	This is CreateRoundedStyle, a member of class TScreenTipsWindow.
V	CreateTipBorderStyle (see page 355)	This is CreateTipBorderStyle, a member of class TScreenTipsWindow.
V	CreateWnd (see page 355)	Creates the underlying window.
V	DrawBackground (see page 355)	This is DrawBackground, a member of class TScreenTipsWindow.
V	DrawBorder (see page 356)	This is DrawBorder, a member of class TScreenTipsWindow.
V	DrawFooter (see page 356)	This is DrawFooter, a member of class TScreenTipsWindow.
V	DrawHeader (see page 356)	This is DrawHeader, a member of class TScreenTipsWindow.
V	Paint (see page 356)	Renders the image of a custom control.
	WMNCHitTest (see page 357)	This is WMNCHitTest, a member of class TScreenTipsWindow.

Public Methods

	Name	Description
V	ActivateToolTip (see page 353)	This is ActivateToolTip, a member of class TScreenTipsWindow.
	HideHint (see page 356)	This is HideHint, a member of class TScreenTipsWindow.

5.1.13.4.1 TScreenTipsWindow.ActivateToolTip Method

Pascal

```
procedure ActivateToolTip(Rect: TRect; Item: TScreenTipItem); virtual;
```

C++

```
virtual __fastcall ActivateToolTip(TRect Rect, TScreenTipItem Item);
```

Description

This is ActivateToolTip, a member of class TScreenTipsWindow.

5.1.13.4.2 TScreenTipsWindow.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TScreenTipsWindow.

5.1.13.4.3 TScreenTipsWindow.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TScreenTipsWindow.

5.1.13.4.4 TScreenTipsWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

CreateWindowHandle

CreateWnd

AddBiDiModeExStyle

5.1.13.4.5 TScreenTipsWindow.CreateRoundedStyle Method

Pascal

```
procedure CreateRoundedStyle; virtual;
```

C++

```
virtual __fastcall CreateRoundedStyle();
```

Description

This is CreateRoundedStyle, a member of class TScreenTipsWindow.

5.1.13.4.6 TScreenTipsWindow.CreateTipBorderStyle Method

Pascal

```
procedure CreateTipBorderStyle; virtual;
```

C++

```
virtual __fastcall CreateTipBorderStyle();
```

Description

This is CreateTipBorderStyle, a member of class TScreenTipsWindow.

5.1.13.4.7 TScreenTipsWindow.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

DestroyWnd

5.1.13.4.8 TScreenTipsWindow.DrawBackground Method

Pascal

```
procedure DrawBackground(const aRect: TRect); virtual;
```

C++

```
virtual __fastcall DrawBackground(const TRect aRect);
```

Description

This is DrawBackground, a member of class TScreenTipsWindow.

5.1.13.4.9 TScreenTipsWindow.DrawBorder Method

Pascal

```
procedure DrawBorder(const aRect: TRect); virtual;
```

C++

```
virtual __fastcall DrawBorder(const TRect aRect);
```

Description

This is DrawBorder, a member of class TScreenTipsWindow.

5.1.13.4.10 TScreenTipsWindow.DrawFooter Method

Pascal

```
procedure DrawFooter; virtual;
```

C++

```
virtual __fastcall DrawFooter();
```

Description

This is DrawFooter, a member of class TScreenTipsWindow.

5.1.13.4.11 TScreenTipsWindow.DrawHeader Method

Pascal

```
function DrawHeader: Integer; virtual;
```

C++

```
virtual __fastcall int DrawHeader();
```

Description

This is DrawHeader, a member of class TScreenTipsWindow.

5.1.13.4.12 TScreenTipsWindow.HideHint Method

Pascal

```
procedure HideHint;
```

C++

```
__fastcall HideHint();
```

Description

This is HideHint, a member of class TScreenTipsWindow.

5.1.13.4.13 TScreenTipsWindow.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

5.1.13.4.14 TScreenTipsWindow.WMNCHitTest Method

Pascal

```
procedure WMNCHitTest(var Message: TWMNCHitTest); message WM_NCHITTEST;
```

C++

```
__fastcall WMNCHitTest(TWMNCHitTest Message);
```

Description

This is WMNCHitTest, a member of class TScreenTipsWindow.

5.1.13.5 TScreenTipsWindow Properties

The properties of the TScreenTipsWindow class are listed here.

Public Properties

	Name	Description
R	ActiveItem (see page 357)	This is ActiveItem, a member of class TScreenTipsWindow.
	Body (see page 358)	This is Body, a member of class TScreenTipsWindow.
	CornerSize (see page 358)	This is CornerSize, a member of class TScreenTipsWindow.
	Footer (see page 358)	This is Footer, a member of class TScreenTipsWindow.
	FooterImage (see page 358)	This is FooterImage, a member of class TScreenTipsWindow.
	GradientEndColor (see page 359)	This is GradientEndColor, a member of class TScreenTipsWindow.
	GradientStartColor (see page 359)	This is GradientStartColor, a member of class TScreenTipsWindow.
	HintControl (see page 359)	This is HintControl, a member of class TScreenTipsWindow.
	Image (see page 359)	This is Image, a member of class TScreenTipsWindow.
	TipBorderStyle (see page 359)	This is TipBorderStyle, a member of class TScreenTipsWindow.

5.1.13.5.1 TScreenTipsWindow.ActiveItem Property

Pascal

```
property ActiveItem: TScreenTipItem;
```

C++

```
__property TScreenTipItem ActiveItem;
```

Description

This is ActiveItem, a member of class TScreenTipsWindow.

5.1.13.5.2 TScreenTipsWindow.Body Property

Pascal

```
property Body: string;
```

C++

```
__property UnicodeString Body;
```

Description

This is Body, a member of class TScreenTipsWindow.

5.1.13.5.3 TScreenTipsWindow.CornerSize Property

Pascal

```
property CornerSize: Integer;
```

C++

```
__property int CornerSize;
```

Description

This is CornerSize, a member of class TScreenTipsWindow.

5.1.13.5.4 TScreenTipsWindow.Footer Property

Pascal

```
property Footer: string;
```

C++

```
__property UnicodeString Footer;
```

Description

This is Footer, a member of class TScreenTipsWindow.

5.1.13.5.5 TScreenTipsWindow.FooterImage Property

Pascal

```
property FooterImage: TBitmap;
```

C++

```
__property TBitmap FooterImage;
```

Description

This is FooterImage, a member of class TScreenTipsWindow.

5.1.13.5.6 TScreenTipsWindow.GradientEndColor Property

Pascal

```
property GradientEndColor: TColor;
```

C++

```
__property TColor GradientEndColor;
```

Description

This is GradientEndColor, a member of class TScreenTipsWindow.

5.1.13.5.7 TScreenTipsWindow.GradientStartColor Property

Pascal

```
property GradientStartColor: TColor;
```

C++

```
__property TColor GradientStartColor;
```

Description

This is GradientStartColor, a member of class TScreenTipsWindow.

5.1.13.5.8 TScreenTipsWindow.HintControl Property

Pascal

```
property HintControl: TControl;
```

C++

```
__property TControl * HintControl;
```

Description

This is HintControl, a member of class TScreenTipsWindow.

5.1.13.5.9 TScreenTipsWindow.Image Property

Pascal

```
property Image: TPicture;
```

C++

```
__property TPicture Image;
```

Description

This is Image, a member of class TScreenTipsWindow.

5.1.13.5.10 TScreenTipsWindow.TipBorderStyle Property

Pascal

```
property TipBorderStyle: TTipBorderStyle;
```

C++

```
__property TTipBorderStyle TipBorderStyle;
```

Description

This is TipBorderStyle, a member of class TScreenTipsWindow.

5.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IScreenTipItem (see page 361)	This is class ScreenTips.IScreenTipItem.

5.2.1 IScreenTipItem Interface

Class Hierarchy

ScreenTips.IScreenTipItem

Pascal

```
IScreenTipItem = interface;
```

C++

```
__interface IScreenTipItem;
```

File

ScreenTips

Description

This is class ScreenTips.IScreenTipItem.

5.2.1.1 IScreenTipItem Members

The following tables list the members exposed by IScreenTipItem.

Public Methods

	Name	Description
	GetScreenTipItem (see page 362)	This is GetScreenTipItem, a member of class IScreenTipItem.

5.2.1.2 IScreenTipItem Methods

The methods of the IScreenTipItem class are listed here.

Public Methods

	Name	Description
	GetScreenTipItem (see page 362)	This is GetScreenTipItem, a member of class IScreenTipItem.

5.2.1.2.1 IScreenTipItem.GetScreenTipItem Method

Pascal

```
function GetScreenTipItem: TScreenTipItem;
```

C++

```
__fastcall TScreenTipItem GetScreenTipItem();
```

Description

This is GetScreenTipItem, a member of class IScreenTipItem.

5.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDescriptionType (see page 363)	This is record ScreenTips.TDescriptionType.
	TImageAlign (see page 363)	This is record ScreenTips.TImageAlign.
	TItemImageAlign (see page 364)	This is record ScreenTips.TItemImageAlign.
	TScreenTipOption (see page 364)	This is record ScreenTips.TScreenTipOption.
	TScreenTipPopupType (see page 365)	This is record ScreenTips.TScreenTipPopupType.
	TTipBorderStyle (see page 365)	This is record ScreenTips.TTipBorderStyle.

5.3.1 ScreenTips.TDescriptionType Enumeration

Pascal

```
TDescriptionType = (
  dtManual,
  dtHelp,
  dtResource
);
```

C++

```
enum TDescriptionType {
  dtManual,
  dtHelp,
  dtResource
};
```

File

ScreenTips

Description

This is record ScreenTips.TDescriptionType.

5.3.2 ScreenTips.TImageAlign Enumeration

Pascal

```
TImageAlign = (
  iaLeft,
  iaRight
);
```

C++

```
enum TImageAlign {
  iaLeft,
  iaRight
```

```
};
```

File

ScreenTips

Description

This is record ScreenTips.TImageAlign.

5.3.3 ScreenTips.TItemImageAlign Enumeration

Pascal

```
TItemImageAlign = (
  iiaLeft,
  iiaCenter,
  iiaRight
);
```

C++

```
enum TItemImageAlign {
  iiaLeft,
  iiaCenter,
  iiaRight
};
```

File

ScreenTips

Description

This is record ScreenTips.TItemImageAlign.

5.3.4 ScreenTips.TScreenTipOption Enumeration

Pascal

```
TScreenTipOption = (
  soShowHeader,
  soShowShortCut
);
```

C++

```
enum TScreenTipOption {
  soShowHeader,
  soShowShortCut
};
```

File

ScreenTips

Description

This is record ScreenTips.TScreenTipOption.

5.3.5 ScreenTips.TScreenTipPopupType Enumeration

Pascal

```
TScreenTipPopupType = (
  ptCustom,
  ptHelp,
  ptInfo
);
```

C++

```
enum TScreenTipPopupType {
  ptCustom,
  ptHelp,
  ptInfo
};
```

File

ScreenTips

Description

This is record ScreenTips.TScreenTipPopupType.

5.3.6 ScreenTips.TTipBorderStyle Enumeration

Pascal

```
TTipBorderStyle = (
  hbsNormal,
  hbsRounded
);
```

C++

```
enum TTipBorderStyle {
  hbsNormal,
  hbsRounded
};
```

File

ScreenTips

Description

This is record ScreenTips.TTipBorderStyle.

5.4 Types

The following table lists types in this documentation.

Types

Name	Description
TCreateScreenTipEvent (see page 366)	This is type ScreenTips.TCreateScreenTipEvent.
TDuplicateCreateErrorEvent (see page 366)	This is type ScreenTips.TDuplicateCreateErrorEvent.
TScreenTipOptions (see page 367)	This is type ScreenTips.TScreenTipOptions.
TScreenTipsWindowClass (see page 367)	This is type ScreenTips.TScreenTipsWindowClass.
TScreenTipWinClass (see page 367)	This is type ScreenTips.TScreenTipWinClass.
TShowScreenTipEvent (see page 368)	This is type ScreenTips.TShowScreenTipEvent.

5.4.1 ScreenTips.TCreateScreenTipEvent Type

Pascal

```
TCreateScreenTipEvent = procedure (Manager: TObject; Item: TScreenTipItem) of object;
```

C++

```
(Manager: TObject; Item: TScreenTipItem) ( TCreateScreenTipEvent)();
```

File

ScreenTips

Description

This is type ScreenTips.TCreateScreenTipEvent.

5.4.2 ScreenTips.TDuplicateCreateErrorEvent Type

Pascal

```
TDuplicateCreateErrorEvent = procedure (Manager: TObject; Action: TBasicAction) of object;
```

C++

```
(Manager: TObject; Action: TBasicAction) ( TDuplicateCreateErrorEvent)();
```

File

ScreenTips

Description

This is type ScreenTips.TDuplicateCreateErrorEvent.

5.4.3 ScreenTips.TScreenTipOptions Type

Pascal

```
TScreenTipOptions = set of TScreenTipOption;
```

C++

```
TScreenTipOption TScreenTipOptions;
```

File

ScreenTips

Description

This is type ScreenTips.TScreenTipOptions.

5.4.4 ScreenTips.TScreenTipsWindowClass Type

Pascal

```
TScreenTipsWindowClass = class of TScreenTipsWindow;
```

C++

```
TScreenTipsWindow TScreenTipsWindowClass;
```

File

ScreenTips

Description

This is type ScreenTips.TScreenTipsWindowClass.

5.4.5 ScreenTips.TScreenTipWinClass Type

Pascal

```
TScreenTipWinClass = procedure (Manager: TObject; var ScreenTipWinClass:
TScreenTipsWindowClass) of object;
```

C++

```
(Manager: TObject; var ScreenTipWinClass: TScreenTipsWindowClass) ( TScreenTipWinClass)();
```

File

ScreenTips

Description

This is type ScreenTips.TScreenTipWinClass.

5.4.6 ScreenTips.TShowScreenTipEvent Type

Pascal

```
TShowScreenTipEvent = procedure (Manager: TObject; Action: TBasicAction; var ShowScreenTip:
Boolean) of object;
```

C++

```
(Manager: TObject; Action: TBasicAction; var ShowScreenTip: Boolean) ( TShowScreenTipEvent)();
```

File

ScreenTips

Description

This is type ScreenTips.TShowScreenTipEvent.

5.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cDefaultBorderColor (see page 369)	This is constant ScreenTips.cDefaultBorderColor.
cDefaultEndColor (see page 369)	This is constant ScreenTips.cDefaultEndColor.
cDefaultStartColor (see page 370)	This is constant ScreenTips.cDefaultStartColor.
cScreenTipHeaderSpacing (see page 370)	This is constant ScreenTips.cScreenTipHeaderSpacing.
cScreenTipMinimumHeight (see page 370)	This is constant ScreenTips.cScreenTipMinimumHeight.
cScreenTipTextAndImageWidth (see page 371)	This is constant ScreenTips.cScreenTipTextAndImageWidth.
cScreenTipTextOnlyWidth (see page 371)	This is constant ScreenTips.cScreenTipTextOnlyWidth.

5.5.1 ScreenTips.cDefaultBorderColor Constant

Pascal

```
cDefaultBorderColor = $00767676;
```

C++

```
cDefaultBorderColor = 0x00767676;
```

File

ScreenTips

Description

This is constant ScreenTips.cDefaultBorderColor.

5.5.2 ScreenTips.cDefaultEndColor Constant

Pascal

```
cDefaultEndColor = clBtnFace;
```

C++

```
cDefaultEndColor = clBtnFace;
```

File

ScreenTips

Description

This is constant ScreenTips.cDefaultEndColor.

5.5.3 ScreenTips.cDefaultStartColor Constant

Pascal

```
cDefaultStartColor = clWhite;
```

C++

```
cDefaultStartColor = clWhite;
```

File

ScreenTips

Description

This is constant ScreenTips.cDefaultStartColor.

5.5.4 ScreenTips.cScreenTipHeaderSpacing Constant

Pascal

```
cScreenTipHeaderSpacing = 14;
```

C++

```
cScreenTipHeaderSpacing = 14;
```

File

ScreenTips

Description

This is constant ScreenTips.cScreenTipHeaderSpacing.

5.5.5 ScreenTips.cScreenTipMinimumHeight Constant

Pascal

```
cScreenTipMinimumHeight = 50;
```

C++

```
cScreenTipMinimumHeight = 50;
```

File

ScreenTips

Description

This is constant ScreenTips.cScreenTipMinimumHeight.

5.5.6 ScreenTips.cScreenTipTextAndImageWidth Constant

Pascal

```
cScreenTipTextAndImageWidth = 318;
```

C++

```
cScreenTipTextAndImageWidth = 318;
```

File

ScreenTips

Description

This is constant ScreenTips.cScreenTipTextAndImageWidth.

5.5.7 ScreenTips.cScreenTipTextOnlyWidth Constant

Pascal

```
cScreenTipTextOnlyWidth = 210;
```

C++

```
cScreenTipTextOnlyWidth = 210;
```

File

ScreenTips

Description

This is constant ScreenTips.cScreenTipTextOnlyWidth.

6 SessColn Namespace

This is namespace SessColn.

Topics

Name	Description
Classes (see page 374)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 396)	The following table lists structs, records, enums in this documentation.
Types (see page 397)	The following table lists types in this documentation.
Variables (see page 398)	The following table lists variables in this documentation.

Classes

	Name	Description
	ESessionsException (see page 374)	ESessionsException is the exception that is raised when TSessionsService encounters a problem.
	TAbstractSessionIDGen (see page 374)	This is class SessColn.TAbstractSessionIDGen.
	TAbstractSessionStatusChange (see page 375)	This is class SessColn.TAbstractSessionStatusChange.
	TSessionIDGen (see page 377)	This is class SessColn.TSessionIDGen.
	TSessionItem (see page 378)	
	TSessions (see page 384)	

Structs, Records, Enums

	Name	Description
	TSessionStatusFlag (see page 396)	This is record SessColn.TSessionStatusFlag.

Types

Name	Description
TSessionStatusFlags (see page 397)	This is type SessColn.TSessionStatusFlags.

Variables

Name	Description
Sessions (see page 398)	This is variable SessColn.Sessions.

6.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESessionsException (see page 374)	ESessionsException is the exception that is raised when TSessionsService encounters a problem.
	TAbstractSessionIDGen (see page 374)	This is class SessColn.TAbstractSessionIDGen.
	TAbstractSessionStatusChange (see page 375)	This is class SessColn.TAbstractSessionStatusChange.
	TSessionIDGen (see page 377)	This is class SessColn.TSessionIDGen.
	TSessionItem (see page 378)	
	TSessions (see page 384)	

6.1.1 ESessionsException Class

ESessionsException is the exception that is raised when TSessionsService encounters a problem.

Class Hierarchy

Pascal

```
ESessionsException = class(EWebBrokerException);
```

C++

```
class ESessionsException : public EWebBrokerException;
```

File

SessColn

Description

ESessionsException represents exceptions that occur when managing the Web sessions in a WebSnap application. For example, this exception is raised when the application tries to create a new session and the sessions service is already storing the maximum allowed number of sessions.

See Also

TSessionsService (see page 6756)

6.1.2 TAbstractSessionIDGen Class

Class Hierarchy

Pascal

```
TAbstractSessionIDGen = class;
```

C++

```
class TAbstractSessionIDGen;
```

File

SessColn

Description

This is class SessColn.TAbstractSessionIDGen.

6.1.2.1 TAbstractSessionIDGen Members

The following tables list the members exposed by TAbstractSessionIDGen.

Public Methods

	Name	Description
	NextID (see page 375)	This is NextID, a member of class TAbstractSessionIDGen.

6.1.2.2 TAbstractSessionIDGen Methods

The methods of the TAbstractSessionIDGen class are listed here.

Public Methods

	Name	Description
	NextID (see page 375)	This is NextID, a member of class TAbstractSessionIDGen.

6.1.2.2.1 TAbstractSessionIDGen.NextID Method

Pascal

```
function NextID: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString NextID() = 0;
```

Description

This is NextID, a member of class TAbstractSessionIDGen.

6.1.3 TAbstractSessionStatusChange Class

Class Hierarchy

Pascal

```
TAbstractSessionStatusChange = class;
```

C++

```
class TAbstractSessionStatusChange;
```

File

SessColn

Description

This is class SessColn.TAbstractSessionStatusChange.

6.1.3.1 TAbstractSessionStatusChange Members

The following tables list the members exposed by TAbstractSessionStatusChange.

Protected Methods

	Name	Description
	SessionStarted (see page 376)	This is SessionStarted, a member of class TAbstractSessionStatusChange.
	SessionTerminated (see page 376)	This is SessionTerminated, a member of class TAbstractSessionStatusChange.
	SessionTimeout (see page 377)	This is SessionTimeout, a member of class TAbstractSessionStatusChange.

6.1.3.2 TAbstractSessionStatusChange Methods

The methods of the TAbstractSessionStatusChange class are listed here.

Protected Methods

	Name	Description
	SessionStarted (see page 376)	This is SessionStarted, a member of class TAbstractSessionStatusChange.
	SessionTerminated (see page 376)	This is SessionTerminated, a member of class TAbstractSessionStatusChange.
	SessionTimeout (see page 377)	This is SessionTimeout, a member of class TAbstractSessionStatusChange.

6.1.3.2.1 TAbstractSessionStatusChange.SessionStarted Method

Pascal

```
procedure SessionStarted(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionStarted(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionStarted, a member of class TAbstractSessionStatusChange.

6.1.3.2.2 TAbstractSessionStatusChange.SessionTerminated Method

Pascal

```
procedure SessionTerminated(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionTerminated(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionTerminated, a member of class TAbstractSessionStatusChange.

6.1.3.2.3 TAbstractSessionStatusChange.SessionTimeout Method

Pascal

```
procedure SessionTimeout(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionTimeout(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionTimeout, a member of class TAbstractSessionStatusChange.

6.1.4 TSessionIDGen Class

Class Hierarchy

Pascal

```
TSessionIDGen = class(TAbstractSessionIDGen);
```

C++

```
class TSessionIDGen : public TAbstractSessionIDGen;
```

File

SessColn

Description

This is class SessColn.TSessionIDGen.

6.1.4.1 TSessionIDGen Members

The following tables list the members exposed by TSessionIDGen.

Public Methods

	Name	Description
	Create (see page 377)	This is Create, a member of class TSessionIDGen.
V	NextID (see page 378)	This is NextID, a member of class TSessionIDGen.

6.1.4.2 TSessionIDGen.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TSessionIDGen();
```

Description

This is Create, a member of class TSessionIDGen.

6.1.4.3 TSessionIDGen Methods

The methods of the TSessionIDGen class are listed here.

Public Methods

	Name	Description
	NextID (see page 378)	This is NextID, a member of class TSessionIDGen.

6.1.4.3.1 TSessionIDGen.NextID Method

Pascal

```
function NextID: string; override;
```

C++

```
virtual __fastcall UnicodeString NextID();
```

Description

This is NextID, a member of class TSessionIDGen.

6.1.5 TSessionItem Class

Class Hierarchy

Pascal

```
TSessionItem = class(TCollectionItem);
```

C++

```
class TSessionItem : public TCollectionItem;
```

File

SessColn

See Also

TSessions (see page 384)

6.1.5.1 TSessionItem Members

The following tables list the members exposed by TSessionItem.

Public Methods

	Name	Description
	Assign (see page 380)	Copies the properties of one web session item to another web session item.
	Create (see page 379)	Creates and initializes a TCollectionItem instance.
	Destroy (see page 379)	Destroys the TCollectionItem instance and frees its memory.
	IsActive (see page 380)	Sets the state of the web session.

Public Properties

	Name	Description
	ExpirationTime (see page 381)	Indicates when the Web session is to be terminated.

Published Properties

	Name	Description
	Expired (see page 381)	Indicates whether the web session is expired.
	ID (see page 382)	
	Items (see page 382)	
	StartTime (see page 382)	Indicates when the Web session is to be started.
	StatusFlags (see page 382)	Gets or sets the status for the web session.
	Terminated (see page 383)	Sets the status of a web session to terminated.
	TimeoutMinutes (see page 383)	Sets the number of minutes before an idle web session is timed-out.
	TouchTime (see page 384)	

6.1.5.2 TSessionItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TSessionItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add

Collection

6.1.5.3 TSessionItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSessionItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear

Delete

System::TObject::Free (see page 3372)

6.1.5.4 TSessionItem Methods

The methods of the TSessionItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 380)	Copies the properties of one web session item to another web session item.
	IsActive (see page 380)	Sets the state of the web session.

6.1.5.4.1 TSessionItem.Assign Method

Copies the properties of one web session item to another web session item.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use the Assign method to assign the value of one web session item to another web session item. (more here)

See Also

Assign

6.1.5.4.2 TSessionItem.IsActive Method

Sets the state of the web session.

Pascal

```
function IsActive: Boolean;
```

C++

```
__fastcall Boolean IsActive();
```

Description

Use the IsActive method to set the web session state. Set IsActive to True true to continue a web session. Otherwise, set it to False false. (More here).

See Also

StatusFlags (see page 382)

Terminated (see page 383)

GetIsActive (see page 389)

6.1.5.5 TSessionItem Properties

The properties of the TSessionItem class are listed here.

Public Properties

	Name	Description
	ExpirationTime (see page 381)	Indicates when the Web session is to be terminated.

Published Properties

	Name	Description
	Expired (see page 381)	Indicates whether the web session is expired.
	ID (see page 382)	
	Items (see page 382)	
	StartTime (see page 382)	Indicates when the Web session is to be started.
	StatusFlags (see page 382)	Gets or sets the status for the web session.
	Terminated (see page 383)	Sets the status of a web session to terminated.
	TimeoutMinutes (see page 383)	Sets the number of minutes before an idle web session is timed-out.
	TouchTime (see page 384)	

6.1.5.5.1 TSessionItem.ExpirationTime Property

Indicates when the Web session is to be terminated.

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

Read (see page 3634) ExpirationTime to see when the web session is (was?) to be terminated. The expiration time is represented by a TDateTime (see page 3323) type.

See Also

Expired (see page 381)

StartTime (see page 382)

GetExpirationTime (see page 388)

6.1.5.5.2 TSessionItem.Expired Property

Indicates whether the web session is expired.

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

Set Expired to True true to end a web session. Otherwise, set it to False false (More here).

See Also

ExpirationTime (see page 381)

Terminated (see page 383)

GetExpired (see page 388)

6.1.5.5.3 TSessionItem.ID Property

Pascal

```
property ID: string;
```

C++

```
__property UnicodeString ID;
```

6.1.5.5.4 TSessionItem.Items Property

Pascal

```
property Items: TAbstractNamedVariants;
```

C++

```
__property TAbstractNamedVariants Items;
```

6.1.5.5.5 TSessionItem.StartTime Property

Indicates when the Web session is to be started.

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

Use StartTime to start a web session at a certain date and time. The start time is represented by a TDateTime (see page 3323) type.

See Also

ExpirationTime (see page 381)

TouchTime (see page 384)

GetStartTime (see page 390)

6.1.5.5.6 TSessionItem.StatusFlags Property

Gets or sets the status for the web session.

Pascal

```
property StatusFlags: TSessionStatusFlags;
```

C++

```
__property TSessionStatusFlags StatusFlags;
```

Description

Set StatusFlags to change the state of the web session. (more here)

The TSessionStatusFlags (see page 397) type defines the set of possible state flags for the StatusFlags property. The following table lists the possible values for the TSessionStatusFlags (see page 397) type and the meaning corresponding to each flag:

Flag	Web session state
ssStarted	The web session is started.
ssTerminated	The web session is terminated.
ssTimeout	The web session is timed-out.

See Also

StartTime (see page 382)

Terminated (see page 383)

TimeoutMinutes (see page 383)

CheckStatusChange (see page 386)

6.1.5.5.7 TSessionItem.Terminated Property

Sets the status of a web session to terminated.

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

Set Terminated to True true to end a web session. Otherwise, set it to False false. (More here).

See Also

StatusFlags (see page 382)

TimeoutMinutes (see page 383)

GetTerminated (see page 390)

6.1.5.5.8 TSessionItem.TimeoutMinutes Property

Sets the number of minutes before an idle web session is timed-out.

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

Set TimeoutMinutes to the number of minutes a web session that a web session can be idle before it is timed out by the server. (More here)

See Also

StatusFlags (see page 382)

Terminated (see page 383)

GetTimeoutMinutes (see page 390)

6.1.5.5.9 TSessionItem.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

See Also

GetTouchTime (see page 391)

6.1.6 TSessions Class

Class Hierarchy

Pascal

```
TSessions = class(TCollection);
```

C++

```
class TSessions : public TCollection;
```

File

SessColn

6.1.6.1 TSessions Members

The following tables list the members exposed by TSessions.

Public Methods

	Name	Description
	CheckStatusChange (see page 386)	CheckStatusChanges checks if the session status has changed.
	ConnectActiveSession (see page 387)	This is ConnectActiveSession, a member of class TSessions.
	ConnectSession (see page 387)	
	Create (see page 385)	Constructs an object and initializes its data before the object is first used.
V	CreateSessionIDGen (see page 387)	This is CreateSessionIDGen, a member of class TSessions.
V	Destroy (see page 385)	Destroys the collection and each item in it.
	DisconnectSession (see page 387)	Disconnects the specified session.
	GetExpirationTime (see page 388)	Gets the expiration time for the specified session.
	GetExpired (see page 388)	
	GetIDCount (see page 388)	This is GetIDCount, a member of class TSessions.
	GetIDs (see page 388)	This is GetIDs, a member of class TSessions.
	GetIsActive (see page 389)	
	GetItemCount (see page 389)	Gets the number of items in the specified session.
	GetItems (see page 389)	
	GetSession (see page 389)	
	GetSessionIDGen (see page 390)	This is GetSessionIDGen, a member of class TSessions.
	GetStartTime (see page 390)	Gets the start time for the specified session.
	GetTerminated (see page 390)	

	GetTimeoutMinutes (see page 390)	Gets the number of minutes before the session times out.
	GetTouchTime (see page 391)	
	ItemValue (see page 391)	
	LoadFromFile (see page 391)	Loads the session information from a file.
	LoadFromStream (see page 391)	Loads the session information from a stream.
	NotifyStatusChange (see page 392)	
	SaveToFile (see page 392)	Saves the session information to a file.
	SaveToStream (see page 392)	Saves the session output to a stream.
	SessionExists (see page 393)	Indicates whether the specified session exists.
	SetItemValue (see page 393)	
	SetTimeoutMinutes (see page 393)	Sets the timeout minutes for the specified session.
	StartSession (see page 393)	Starts a new session.
	TerminateSession (see page 394)	Terminates the specified session.
	TouchSession (see page 394)	

Public Properties

	Name	Description
R	ActiveCount (see page 394)	This is ActiveCount, a member of class TSessions.
	FileName (see page 395)	Gets or sets the file name for the session.
	MaxSessions (see page 395)	This is MaxSessions, a member of class TSessions.

6.1.6.2 TSessions.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TSessions();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

6.1.6.3 TSessions.Destroy Destructor

Destroys the collection and each item in it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSessions();
```

Description

Destroy calls the Clear method to free each item referenced in the Items array, then destroys the collection itself.

See Also

Clear

System::TObject::Free (see page 3372)

6.1.6.4 TSessions Methods

The methods of the TSessions class are listed here.

Public Methods

	Name	Description
	CheckStatusChange (see page 386)	CheckStatusChanges checks if the session status has changed.
	ConnectActiveSession (see page 387)	This is ConnectActiveSession, a member of class TSessions.
	ConnectSession (see page 387)	
V	CreateSessionIDGen (see page 387)	This is CreateSessionIDGen, a member of class TSessions.
	DisconnectSession (see page 387)	Disconnects the specified session.
	GetExpirationTime (see page 388)	Gets the expiration time for the specified session.
	GetExpired (see page 388)	
	GetIDCount (see page 388)	This is GetIDCount, a member of class TSessions.
	GetIDs (see page 388)	This is GetIDs, a member of class TSessions.
	GetIsActive (see page 389)	
	GetItemCount (see page 389)	Gets the number of items in the specified session.
	GetItems (see page 389)	
	GetSession (see page 389)	
	GetSessionIDGen (see page 390)	This is GetSessionIDGen, a member of class TSessions.
	GetStartTime (see page 390)	Gets the start time for the specified session.
	GetTerminated (see page 390)	
	GetTimeoutMinutes (see page 390)	Gets the number of minutes before the session times out.
	GetTouchTime (see page 391)	
	ItemValue (see page 391)	
	LoadFromFile (see page 391)	Loads the session information from a file.
	LoadFromStream (see page 391)	Loads the session information from a stream.
	NotifyStatusChange (see page 392)	
	SaveToFile (see page 392)	Saves the session information to a file.
	SaveToStream (see page 392)	Saves the session output to a stream.
	SessionExists (see page 393)	Indicates whether the specified session exists.
	SetItemValue (see page 393)	
	SetTimeoutMinutes (see page 393)	Sets the timeout minutes for the specified session.
	StartSession (see page 393)	Starts a new session.
	TerminateSession (see page 394)	Terminates the specified session.
	TouchSession (see page 394)	

6.1.6.4.1 TSessions.CheckStatusChange Method

CheckStatusChanges checks if the session status has changed.

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

Call CheckStatusChange to check if the session status has changed. Set CheckStatusChange to T true to monitor changes to the session's status. Otherwise, set it to F false. (more here)

See Also

StatusFlags (see page 382)

6.1.6.4.2 TSessions.ConnectActiveSession Method

Pascal

```
function ConnectActiveSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean ConnectActiveSession(TSessionID AID);
```

Description

This is ConnectActiveSession, a member of class TSessions.

6.1.6.4.3 TSessions.ConnectSession Method

Pascal

```
function ConnectSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean ConnectSession(TSessionID AID);
```

See Also

DisconnectSession (see page 387)

6.1.6.4.4 TSessions.CreateSessionIDGen Method

Pascal

```
function CreateSessionIDGen: TAbstractSessionIDGen; virtual;
```

C++

```
virtual __fastcall TAbstractSessionIDGen CreateSessionIDGen();
```

Description

This is CreateSessionIDGen, a member of class TSessions.

6.1.6.4.5 TSessions.DisconnectSession Method

Disconnects the specified session.

Pascal

```
procedure DisconnectSession(AID: TSessionID);
```

C++

```
__fastcall DisconnectSession(TSessionID AID);
```

Description

Call DisconnectSession to disconnect the session specified by the TSessionID (see page 1129).

See Also

ConnectSession (see page 387)

6.1.6.4.6 TSessions.GetExpirationTime Method

Gets the expiration time for the specified session.

Pascal

```
function GetExpirationTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime(TSessionID AID);
```

Description

Call GetExpirationTime to get the expiration time for the session specified by the TSessionID (see page 1129) in a TDateTime (see page 3323) format.

See Also

ExpirationTime (see page 381)

6.1.6.4.7 TSessions.GetExpired Method

Pascal

```
function GetExpired(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetExpired(TSessionID AID);
```

See Also

Expired (see page 381)

6.1.6.4.8 TSessions.GetIDCount Method

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

This is GetIDCount, a member of class TSessions.

6.1.6.4.9 TSessions.GetIDs Method

Pascal

```
procedure GetIDs(var AList: TList);
```

C++

```
__fastcall GetIDs(TList AList);
```

Description

This is GetIDs, a member of class TSessions.

6.1.6.4.10 TSessions.GetIsActive Method

Pascal

```
function GetIsActive(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetIsActive(TSessionID AID);
```

6.1.6.4.11 TSessions.GetItemCount Method

Gets the number of items in the specified session.

Pascal

```
function GetItemCount(AID: TSessionID): Integer;
```

C++

```
__fastcall int GetItemCount(TSessionID AID);
```

Description

Call GetItemCount to get the number of items (returned as an integer) in the session specified by TSessionID (see page 1129). more here

See Also

Items (see page 382)

Items

6.1.6.4.12 TSessions.GetItems Method

Pascal

```
procedure GetItems(AID: TSessionID; var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TSessionID AID, TAbstractNamedVariants AItems);
```

See Also

Items (see page 382)

GetItemCount (see page 389)

6.1.6.4.13 TSessions.GetSession Method

Pascal

```
function GetSession(AID: TSessionID; var AItem: TSessionItem): Boolean;
```

C++

```
__fastcall Boolean GetSession(TSessionID AID, TSessionItem AItem);
```

6.1.6.4.14 TSessions.GetSessionIDGen Method

Pascal

```
function GetSessionIDGen: TAbstractSessionIDGen;
```

C++

```
__fastcall TAbstractSessionIDGen GetSessionIDGen();
```

Description

This is GetSessionIDGen, a member of class TSessions.

6.1.6.4.15 TSessions.GetStartTime Method

Gets the start time for the specified session.

Pascal

```
function GetStartTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime(TSessionID AID);
```

Description

Call GetStartTime to get the start time for a session specified by TSessionID (see page 1129) in a TDateTime (see page 3323) format.

See Also

StartTime (see page 382)

6.1.6.4.16 TSessions.GetTerminated Method

Pascal

```
function GetTerminated(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetTerminated(TSessionID AID);
```

See Also

Terminated (see page 383)

6.1.6.4.17 TSessions.GetTimeoutMinutes Method

Gets the number of minutes before the session times out.

Pascal

```
function GetTimeoutMinutes(AID: TSessionID): Integer;
```

C++

```
__fastcall int GetTimeoutMinutes(TSessionID AID);
```

Description

Call GetTimeoutMinutes to get the number of minutes (represented as an Integer value) before the session specified by TSessionID (see page 1129) is timed out.

See Also

TimeoutMinutes (see page 383)

6.1.6.4.18 TSessions.GetTouchTime Method

Pascal

```
function GetTouchTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime(TSessionID AID);
```

See Also

TouchTime (see page 384)

6.1.6.4.19 TSessions.ItemValue Method

Pascal

```
function ItemValue(AID: TSessionID; const AName: string): Variant;
```

C++

```
__fastcall Variant ItemValue(TSessionID AID, const UnicodeString AName);
```

See Also

Items (see page 382)

6.1.6.4.20 TSessions.LoadFromFile Method

Loads the session information from a file.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const UnicodeString Filename);
```

Description

Call LoadFromFile to load the session information from the specified file.

See Also

LoadFromStream (see page 391)

SaveToFile (see page 392)

6.1.6.4.21 TSessions.LoadFromStream Method

Loads the session information from a stream.

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

Call LoadFromStream to load session information from the specified stream. (more here)

See Also

LoadFromFile (see page 391)

SaveToStream (see page 392)

6.1.6.4.22 TSessions.NotifyStatusChange Method

Pascal

```
procedure NotifyStatusChange(AStatusChange: TAbstractSessionStatusChange);
```

C++

```
__fastcall NotifyStatusChange(TAbstractSessionStatusChange AStatusChange);
```

See Also

StatusFlags (see page 382)

CheckStatusChange (see page 386)

6.1.6.4.23 TSessions.SaveToFile Method

Saves the session information to a file.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const UnicodeString Filename);
```

Description

Call SaveToFile to save the session information to the specified file. (more here)

See Also

LoadFromFile (see page 391)

SaveToStream (see page 392)

6.1.6.4.24 TSessions.SaveToStream Method

Saves the session output to a stream.

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

Call SaveToStream to save the session output to a stream. (more here)

See Also

LoadFromStream (see page 391)

SaveToFile (see page 392)

6.1.6.4.25 TSessions.SessionExists Method

Indicates whether the specified session exists.

Pascal

```
function SessionExists(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean SessionExists(TSessionID AID);
```

Description

Call SessionExists to indicate whether the specified session exists. Set SessionExists to true to indicate to the server that the session is still alive, or false to indicate that it is not.

6.1.6.4.26 TSessions.SetItemValue Method

Pascal

```
procedure SetItemValue(AID: TSessionID; const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetItemValue(TSessionID AID, const UnicodeString AName, const Variant AValue);
```

See Also

ItemValue (see page 391)

6.1.6.4.27 TSessions.SetTimeoutMinutes Method

Sets the timeout minutes for the specified session.

Pascal

```
procedure SetTimeoutMinutes(AID: TSessionID; AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(TSessionID AID, int AValue);
```

Description

Call SetTimeoutMinutes to set the number of minutes before a specified session is timed-out.

See Also

TimeoutMinutes (see page 383)

6.1.6.4.28 TSessions.StartSession Method

Starts a new session.

Pascal

```
function StartSession: TSessionID;
```

C++

```
__fastcall TSessionID StartSession();
```

Description

Call StartSession to start a new session and assign it a session ID. (more here).

See Also

TerminateSession (see page 394)

6.1.6.4.29 TSessions.TerminateSession Method

Terminates the specified session.

Pascal

```
function TerminateSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean TerminateSession(TSessionID AID);
```

Description

Call TerminateSession to terminated the session specified by the TSessionID (see page 1129). Set TerminateSession to T true to terminate the session, otherwise set it to F false.

See Also

StartSession (see page 393)

6.1.6.4.30 TSessions.TouchSession Method

Pascal

```
function TouchSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean TouchSession(TSessionID AID);
```

See Also

TouchTime (see page 384)

GetTouchTime (see page 391)

6.1.6.5 TSessions Properties

The properties of the TSessions class are listed here.

Public Properties

	Name	Description
	ActiveCount (see page 394)	This is ActiveCount, a member of class TSessions.
	FileName (see page 395)	Gets or sets the file name for the session.
	MaxSessions (see page 395)	This is MaxSessions, a member of class TSessions.

6.1.6.5.1 TSessions.ActiveCount Property

Pascal

```
property ActiveCount: Integer;
```

C++

```
__property int ActiveCount;
```

Description

This is ActiveCount, a member of class TSessions.

6.1.6.5.2 TSessions.FileName Property

Gets or sets the file name for the session.

Pascal

```
property FileName: string;
```

C++

```
__property UnicodeString FileName;
```

Description

Use FileName to get or set the file name for the session. (more here)

See Also

SaveToFile (see page 392)

6.1.6.5.3 TSessions.MaxSessions Property

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

This is MaxSessions, a member of class TSessions.

6.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSessionStatusFlag (see page 396)	This is record SessColn.TSessionStatusFlag.

6.2.1 SessColn.TSessionStatusFlag Enumeration

Pascal

```
TSessionStatusFlag = (
  ssStarted,
  ssTerminated,
  ssTimeOut
);
```

C++

```
enum TSessionStatusFlag {
  ssStarted,
  ssTerminated,
  ssTimeOut
};
```

File

SessColn

Description

This is record SessColn.TSessionStatusFlag.

6.3 Types

The following table lists types in this documentation.

Types

Name	Description
TSessionStatusFlags (see page 397)	This is type SessColn.TSessionStatusFlags.

6.3.1 SessColn.TSessionStatusFlags Type

Pascal

```
TSessionStatusFlags = set of TSessionStatusFlag;
```

C++

```
TSessionStatusFlag TSessionStatusFlags;
```

File

SessColn

Description

This is type SessColn.TSessionStatusFlags.

6.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Sessions (see page 398)	This is variable SessColn.Sessions.

6.4.1 SessColn.Sessions Variable

Pascal

```
Sessions: TSessions;
```

C++

```
TSessions Sessions;
```

File

SessColn

Description

This is variable SessColn.Sessions.

7 ShadowWnd Namespace

This is namespace ShadowWnd.

Topics

Name	Description
Classes (see page 400)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 406)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TShadowWindow (see page 400)	This is class ShadowWnd.TShadowWindow.

Structs, Records, Enums

	Name	Description
	TControlSide (see page 406)	This is record ShadowWnd.TControlSide.

7.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TShadowWindow (see page 400)	This is class ShadowWnd.TShadowWindow.

7.1.1 TShadowWindow Class

Class Hierarchy

Pascal

```
TShadowWindow = class(TCustomControl);
```

C++

```
class TShadowWindow : public TCustomControl;
```

File

ShadowWnd

Description

This is class ShadowWnd.TShadowWindow.

7.1.1.1 TShadowWindow Members

The following tables list the members exposed by TShadowWindow.

Protected Methods

	Name	Description
	CreateParams (see page 402)	Initializes a window-creation parameter data structure.
	Notification (see page 403)	Responds to notifications that components are being created or destroyed.
	Paint (see page 403)	Renders the image of a custom control.
	WMEraseBkgnd (see page 404)	This is WMEraseBkgnd, a member of class TShadowWindow.

Public Methods

	Name	Description
	Create (see page 401)	Creates an instance of TCustomControl.
	CreateShadow (see page 401)	This is CreateShadow, a member of class TShadowWindow.
	Destroy (see page 401)	Destroys an instance of TCustomControl.
	SetBounds (see page 404)	Sets the windowed control's boundary properties all at once.

Public Properties

	Name	Description
	Control (see page 405)	This is Control, a member of class TShadowWindow.

	Side (see page 405)	This is Side, a member of class TShadowWindow.

7.1.1.2 TShadowWindow.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShadowWindow(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

Canvas

Owner

7.1.1.3 TShadowWindow.CreateShadow Constructor

Pascal

```
constructor CreateShadow(AOwner: TComponent; ControlSide: TControlSide); virtual;
```

C++

```
virtual __fastcall TShadowWindow(TComponent * AOwner, TControlSide ControlSide);
```

Description

This is CreateShadow, a member of class TShadowWindow.

7.1.1.4 TShadowWindow.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShadowWindow();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

Create

7.1.1.5 TShadowWindow Methods

The methods of the TShadowWindow class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 402)	Initializes a window-creation parameter data structure.
	Notification (see page 403)	Responds to notifications that components are being created or destroyed.
	Paint (see page 403)	Renders the image of a custom control.
	WMEraseBkgnd (see page 404)	This is WMEraseBkgnd, a member of class TShadowWindow.

Public Methods

	Name	Description
	SetBounds (see page 404)	Sets the windowed control's boundary properties all at once.

7.1.1.5.1 TShadowWindow.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override

CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

CreateWindowHandle

CreateWnd

AddBiDiModeExStyle

7.1.1.5.2 TShadowWindow.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

7.1.1.5.3 TShadowWindow.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT

messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

Canvas

PaintWindow

GetDeviceContext

ClipRect

7.1.1.5.4 TShadowWindow.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Top

Width

7.1.1.5.5 TShadowWindow.WMEraseBkgnd Method

Pascal

```
procedure WMEraseBkgnd(var Message: TWMEraseBkgnd); message WM_ERASEBKGND;
```

C++

```
__fastcall WMEraseBkgnd(TWMEraseBkgnd Message);
```

Description

This is WMEraseBkgnd, a member of class TShadowWindow.

7.1.1.6 TShadowWindow Properties

The properties of the TShadowWindow class are listed here.

Public Properties

	Name	Description
	Control (see page 405)	This is Control, a member of class TShadowWindow.
	Side (see page 405)	This is Side, a member of class TShadowWindow.

7.1.1.6.1 TShadowWindow.Control Property

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

This is Control, a member of class TShadowWindow.

7.1.1.6.2 TShadowWindow.Side Property

Pascal

```
property Side: TControlSide;
```

C++

```
__property TControlSide Side;
```

Description

This is Side, a member of class TShadowWindow.

7.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TControlSide (see page 406)	This is record ShadowWnd.TControlSide.

7.2.1 ShadowWnd.TControlSide Enumeration

Pascal

```
TControlSide = (
  csRight,
  csBottom
);
```

C++

```
enum TControlSide {
  csRight,
  csBottom
};
```

File

ShadowWnd

Description

This is record ShadowWnd.TControlSide.

8 SHDocVw Namespace

This is namespace SHDocVw.

Topics

Name	Description
Classes (see page 413)	The following table lists classes in this documentation.
Interfaces (see page 616)	The following table lists interfaces in this documentation.
Types (see page 802)	The following table lists types in this documentation.
Constants (see page 838)	The following table lists constants in this documentation.

Classes

	Name	Description
	CoCScriptErrorList (see page 413)	This is class SHDocVw.CoCScriptErrorList.
	CoInternetExplorer (see page 414)	This is class SHDocVw.CoInternetExplorer.
	CoSearchAssistantOC (see page 415)	This is class SHDocVw.CoSearchAssistantOC.
	CoShellBrowserWindow (see page 417)	This is class SHDocVw.CoShellBrowserWindow.
	CoShellNameSpace (see page 418)	This is class SHDocVw.CoShellNameSpace.
	CoShellUIHelper (see page 419)	This is class SHDocVw.CoShellUIHelper.
	CoShellWindows (see page 420)	This is class SHDocVw.CoShellWindows.
	TInternetExplorer (see page 421)	This is class SHDocVw.TInternetExplorer.
	TShellNameSpace (see page 466)	This is class SHDocVw.TShellNameSpace.
	TShellUIHelper (see page 483)	This is class SHDocVw.TShellUIHelper.
	TShellWindows (see page 494)	This is class SHDocVw.TShellWindows.
	TWebBrowser (see page 504)	TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	TWebBrowser_V1 (see page 569)	This is class SHDocVw.TWebBrowser_V1.

Constants

Name	Description
CGID_IWebBrowser (see page 840)	This is constant SHDocVw.CGID_IWebBrowser.
CLASS_CScriptErrorList (see page 841)	This is constant SHDocVw.CLASS_CScriptErrorList.

	IShellFavoritesNameSpaceDisp (see page 695)	This is class SHDocVw.IShellFavoritesNameSpaceDisp.
	IShellNameSpace (see page 700)	This is class SHDocVw.IShellNameSpace.
	IShellNameSpaceDisp (see page 709)	This is class SHDocVw.IShellNameSpaceDisp.
	IShellUIHelper (see page 716)	This is class SHDocVw.IShellUIHelper.
	IShellUIHelperDisp (see page 721)	This is class SHDocVw.IShellUIHelperDisp.
	IShellWindows (see page 725)	This is class SHDocVw.IShellWindows.
	IShellWindowsDisp (see page 729)	This is class SHDocVw.IShellWindowsDisp.
	IWebBrowser (see page 733)	IWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	IWebBrowser2 (see page 749)	IWebBrowser2 provides access to the Web browser functionality of Microsoft Shell Doc Object and Control Library (SHDOCVW.DLL).
	IWebBrowser2Disp (see page 763)	This is class SHDocVw.IWebBrowser2Disp.
	IWebBrowserApp (see page 776)	This is class SHDocVw.IWebBrowserApp.
	IWebBrowserAppDisp (see page 785)	This is class SHDocVw.IWebBrowserAppDisp.
	IWebBrowserDisp (see page 795)	This is class SHDocVw.IWebBrowserDisp.

Types

Name	Description
BrowserNavConstants (see page 804)	This is type SHDocVw.BrowserNavConstants.

CommandStateChangeConstants (see page 804)	Represents an alias for TOleEnum.
CScriptErrorList (see page 804)	This is type SHDocVw.CScriptErrorList.
InternetExplorer (see page 805)	This is type SHDocVw.InternetExplorer.
OLECMDEXECOPT (see page 805)	OLECMDF (see page 806) influences the way in which an OLECMDID (see page 806) command is executed.
OLECMDF (see page 806)	OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.
OLECMDID (see page 806)	OLECMDID represents a command that can be executed by an Automation object.
POleVariant1 (see page 807)	POleVariant1 is a pointer to a System::OleVariant (see page 3274) variable.
RefreshConstants (see page 807)	This is type SHDocVw.RefreshConstants.
SearchAssistantOC (see page 808)	This is type SHDocVw.SearchAssistantOC.
SecureLockIconConstants (see page 808)	This is type SHDocVw.SecureLockIconConstants.
ShellBrowserWindow (see page 808)	This is type SHDocVw.ShellBrowserWindow.
ShellNameSpace (see page 809)	This is type SHDocVw.ShellNameSpace.
ShellUIHelper (see page 809)	This is type SHDocVw.ShellUIHelper.
ShellWindowFindWindowOptions (see page 809)	This is type SHDocVw.ShellWindowFindWindowOptions.
ShellWindows (see page 810)	This is type SHDocVw.ShellWindows.
ShellWindowTypeConstants (see page 810)	This is type SHDocVw.ShellWindowTypeConstants.
tagREADYSTATE (see page 810)	This is type SHDocVw.tagREADYSTATE.
TInternetExplorerBeforeNavigate2 (see page 811)	This is type SHDocVw.TInternetExplorerBeforeNavigate2.
TInternetExplorerClientToHostWindow (see page 811)	This is type SHDocVw.TInternetExplorerClientToHostWindow.
TInternetExplorerCommandStateChange (see page 811)	This is type SHDocVw.TInternetExplorerCommandStateChange.
TInternetExplorerDocumentComplete (see page 812)	This is type SHDocVw.TInternetExplorerDocumentComplete.
TInternetExplorerFileDownload (see page 812)	This is type SHDocVw.TInternetExplorerFileDownload.
TInternetExplorerNavigateComplete2 (see page 812)	This is type SHDocVw.TInternetExplorerNavigateComplete2.
TInternetExplorerNavigateError (see page 813)	This is type SHDocVw.TInternetExplorerNavigateError.
TInternetExplorerNewWindow2 (see page 813)	This is type SHDocVw.TInternetExplorerNewWindow2.
TInternetExplorerOnFullScreen (see page 813)	This is type SHDocVw.TInternetExplorerOnFullScreen.
TInternetExplorerOnMenuBar (see page 814)	This is type SHDocVw.TInternetExplorerOnMenuBar.
TInternetExplorerOnStatusBar (see page 814)	This is type SHDocVw.TInternetExplorerOnStatusBar.
TInternetExplorerOnTheaterMode (see page 814)	This is type SHDocVw.TInternetExplorerOnTheaterMode.
TInternetExplorerOnToolBar (see page 815)	This is type SHDocVw.TInternetExplorerOnToolBar.
TInternetExplorerOnVisible (see page 815)	This is type SHDocVw.TInternetExplorerOnVisible.
TInternetExplorerPrintTemplateInstantiation (see page 815)	This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.
TInternetExplorerPrintTemplateTeardown (see page 816)	This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.
TInternetExplorerPrivacyImpactedStateChange (see page 816)	This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.
TInternetExplorerProgressChange (see page 816)	This is type SHDocVw.TInternetExplorerProgressChange.
TInternetExplorerPropertyChange (see page 817)	This is type SHDocVw.TInternetExplorerPropertyChange.
TInternetExplorerSetSecureLockIcon (see page 817)	This is type SHDocVw.TInternetExplorerSetSecureLockIcon.
TInternetExplorerStatusTextChange (see page 817)	This is type SHDocVw.TInternetExplorerStatusTextChange.
TInternetExplorerTitleChange (see page 818)	This is type SHDocVw.TInternetExplorerTitleChange.
TInternetExplorerUpdatePageStatus (see page 818)	This is type SHDocVw.TInternetExplorerUpdatePageStatus.
TInternetExplorerWindowClosing (see page 818)	This is type SHDocVw.TInternetExplorerWindowClosing.
TInternetExplorerWindowSetHeight (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetHeight.
TInternetExplorerWindowSetLeft (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetLeft.
TInternetExplorerWindowSetResizable (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetResizable.
TInternetExplorerWindowSetTop (see page 820)	This is type SHDocVw.TInternetExplorerWindowSetTop.
TInternetExplorerWindowSetWidth (see page 820)	This is type SHDocVw.TInternetExplorerWindowSetWidth.
TShellNameSpaceFavoritesSelectionChange (see page 820)	This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.
TShellWindowsWindowRegistered (see page 821)	This is type SHDocVw.TShellWindowsWindowRegistered.
TShellWindowsWindowRevoked (see page 821)	This is type SHDocVw.TShellWindowsWindowRevoked.
TWebBrowser_V1BeforeNavigate (see page 821)	This is type SHDocVw.TWebBrowser_V1BeforeNavigate.
TWebBrowser_V1CommandStateChange (see page 822)	This is type SHDocVw.TWebBrowser_V1CommandStateChange.
TWebBrowser_V1FrameBeforeNavigate (see page 822)	This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.

TWebBrowser_V1FrameNavigateComplete (see page 823)	This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.
TWebBrowser_V1FrameNewWindow (see page 823)	This is type SHDocVw.TWebBrowser_V1FrameNewWindow.
TWebBrowser_V1NavigateComplete (see page 823)	This is type SHDocVw.TWebBrowser_V1NavigateComplete.
TWebBrowser_V1NewWindow (see page 824)	This is type SHDocVw.TWebBrowser_V1NewWindow.
TWebBrowser_V1ProgressChange (see page 824)	This is type SHDocVw.TWebBrowser_V1ProgressChange.
TWebBrowser_V1PropertyChange (see page 824)	This is type SHDocVw.TWebBrowser_V1PropertyChange.
TWebBrowser_V1Quit (see page 825)	This is type SHDocVw.TWebBrowser_V1Quit.
TWebBrowser_V1StatusTextChange (see page 825)	This is type SHDocVw.TWebBrowser_V1StatusTextChange.
TWebBrowser_V1TitleChange (see page 825)	This is type SHDocVw.TWebBrowser_V1TitleChange.
TWebBrowserBeforeNavigate2 (see page 826)	TWebBrowserBeforeNavigate2 is the type for the BeforeNavigate2 event handler on TWebBrowser (see page 504).
TWebBrowserClientToHostWindow (see page 826)	This is type SHDocVw.TWebBrowserClientToHostWindow.
TWebBrowserCommandStateChange (see page 827)	TWebBrowserCommandStateChange is the type for the OnCommandStateChange event handler on TWebBrowser (see page 504).
TWebBrowserDocumentComplete (see page 827)	TWebBrowserDocumentComplete is the type for event handlers that respond when the Service Control manager stops a service.
TWebBrowserFileDownload (see page 828)	This is type SHDocVw.TWebBrowserFileDownload.
TWebBrowserNavigateComplete2 (see page 828)	TWebBrowserNavigateComplete2 is the type for the OnNavigateComplete2 event handler on TWebBrowser (see page 504).
TWebBrowserNavigateError (see page 829)	This is type SHDocVw.TWebBrowserNavigateError.
TWebBrowserNewWindow2 (see page 829)	TWebBrowserNewWindow2 is the type for the OnNewWindow2 event handler on TWebBrowser (see page 504).
TWebBrowserOnFullScreen (see page 830)	This is type SHDocVw.TWebBrowserOnFullScreen.
TWebBrowserOnMenuBar (see page 830)	This is type SHDocVw.TWebBrowserOnMenuBar.
TWebBrowserOnStatusBar (see page 830)	This is type SHDocVw.TWebBrowserOnStatusBar.
TWebBrowserOnTheaterMode (see page 831)	This is type SHDocVw.TWebBrowserOnTheaterMode.
TWebBrowserOnToolBar (see page 831)	This is type SHDocVw.TWebBrowserOnToolBar.
TWebBrowserOnVisible (see page 831)	TWebBrowserOnVisible is the type for the OnVisible event handler on TWebBrowser (see page 504).
TWebBrowserPrintTemplateInstantiation (see page 832)	This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.
TWebBrowserPrintTemplateTeardown (see page 832)	This is type SHDocVw.TWebBrowserPrintTemplateTeardown.
TWebBrowserPrivacyImpactedStateChange (see page 832)	This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.
TWebBrowserProgressChange (see page 833)	TWebBrowserProgressChange is the type for the OnProgressChange event handler on TWebBrowser (see page 504).
TWebBrowserPropertyChange (see page 833)	This is type SHDocVw.TWebBrowserPropertyChange.
TWebBrowserSetSecureLockIcon (see page 834)	This is type SHDocVw.TWebBrowserSetSecureLockIcon.
TWebBrowserStatusTextChange (see page 834)	This is type SHDocVw.TWebBrowserStatusTextChange.
TWebBrowserTitleChange (see page 834)	TWebBrowserTitleChange is the type for the OnTitleChange event handler on TWebBrowser (see page 504).
TWebBrowserUpdatePageStatus (see page 835)	This is type SHDocVw.TWebBrowserUpdatePageStatus.
TWebBrowserWindowClosing (see page 835)	This is type SHDocVw.TWebBrowserWindowClosing.
TWebBrowserWindowSetHeight (see page 835)	This is type SHDocVw.TWebBrowserWindowSetHeight.
TWebBrowserWindowSetLeft (see page 836)	This is type SHDocVw.TWebBrowserWindowSetLeft.
TWebBrowserWindowSetResizable (see page 836)	This is type SHDocVw.TWebBrowserWindowSetResizable.
TWebBrowserWindowSetTop (see page 836)	This is type SHDocVw.TWebBrowserWindowSetTop.
TWebBrowserWindowSetWidth (see page 837)	This is type SHDocVw.TWebBrowserWindowSetWidth.
WebBrowser (see page 837)	This is type SHDocVw.WebBrowser.
WebBrowser_V1 (see page 837)	This is type SHDocVw.WebBrowser_V1.

8.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	CoCScriptErrorList (see page 413)	This is class SHDocVw.CoCScriptErrorList.
	CoInternetExplorer (see page 414)	This is class SHDocVw.CoInternetExplorer.
	CoSearchAssistantOC (see page 415)	This is class SHDocVw.CoSearchAssistantOC.
	CoShellBrowserWindow (see page 417)	This is class SHDocVw.CoShellBrowserWindow.
	CoShellNameSpace (see page 418)	This is class SHDocVw.CoShellNameSpace.
	CoShellUIHelper (see page 419)	This is class SHDocVw.CoShellUIHelper.
	CoShellWindows (see page 420)	This is class SHDocVw.CoShellWindows.
	TInternetExplorer (see page 421)	This is class SHDocVw.TInternetExplorer.
	TShellNameSpace (see page 466)	This is class SHDocVw.TShellNameSpace.
	TShellUIHelper (see page 483)	This is class SHDocVw.TShellUIHelper.
	TShellWindows (see page 494)	This is class SHDocVw.TShellWindows.
	TWebBrowser (see page 504)	TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	TWebBrowser_V1 (see page 569)	This is class SHDocVw.TWebBrowser_V1.

8.1.1 CoCScriptErrorList Class

Class Hierarchy

Pascal

```
CoCScriptErrorList = class;
```

C++

```
class CoCScriptErrorList;
```

File

SHDocVw

Description

This is class SHDocVw.CoCScriptErrorList.

8.1.1.1 CoCScriptErrorList Members

The following tables list the members exposed by CoCScriptErrorList.

Public Methods

	Name	Description
	Create (see page 414)	This is Create, a member of class CoCScriptErrorList.
	CreateRemote (see page 414)	This is CreateRemote, a member of class CoCScriptErrorList.

8.1.1.2 CoCScriptErrorList Methods

The methods of the CoCScriptErrorList class are listed here.

Public Methods

	Name	Description
	Create (see page 414)	This is Create, a member of class CoCScriptErrorList.
	CreateRemote (see page 414)	This is CreateRemote, a member of class CoCScriptErrorList.

8.1.1.2.1 CoCScriptErrorList.Create Method

Pascal

```
class function Create: IScriptErrorList;
```

C++

```
__fastcall IScriptErrorList Create();
```

Description

This is Create, a member of class CoCScriptErrorList.

8.1.1.2.2 CoCScriptErrorList.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IScriptErrorList;
```

C++

```
__fastcall IScriptErrorList CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoCScriptErrorList.

8.1.2 CoInternetExplorer Class

Class Hierarchy

SHDocVw.CoInternetExplorer

Pascal

```
CoInternetExplorer = class;
```

C++

```
class CoInternetExplorer;
```

File

SHDocVw

Description

This is class SHDocVw.CoInternetExplorer.

8.1.2.1 CoInternetExplorer Members

The following tables list the members exposed by CoInternetExplorer.

Public Methods

	Name	Description
	Create (see page 415)	This is Create, a member of class CoInternetExplorer.
	CreateRemote (see page 415)	This is CreateRemote, a member of class CoInternetExplorer.

8.1.2.2 CoInternetExplorer Methods

The methods of the CoInternetExplorer class are listed here.

Public Methods

	Name	Description
	Create (see page 415)	This is Create, a member of class CoInternetExplorer.
	CreateRemote (see page 415)	This is CreateRemote, a member of class CoInternetExplorer.

8.1.2.2.1 CoInternetExplorer.Create Method

Pascal

```
class function Create: IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 Create();
```

Description

This is Create, a member of class CoInternetExplorer.

8.1.2.2.2 CoInternetExplorer.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoInternetExplorer.

8.1.3 CoSearchAssistantOC Class

Class Hierarchy

SHDocVw.CoSearchAssistantOC

Pascal

```
CoSearchAssistantOC = class;
```

C++

```
class CoSearchAssistantOC;
```

File

SHDocVw

Description

This is class SHDocVw.CoSearchAssistantOC.

8.1.3.1 CoSearchAssistantOC Members

The following tables list the members exposed by CoSearchAssistantOC.

Public Methods

	Name	Description
	Create (see page 416)	This is Create, a member of class CoSearchAssistantOC.
	CreateRemote (see page 416)	This is CreateRemote, a member of class CoSearchAssistantOC.

8.1.3.2 CoSearchAssistantOC Methods

The methods of the CoSearchAssistantOC class are listed here.

Public Methods

	Name	Description
	Create (see page 416)	This is Create, a member of class CoSearchAssistantOC.
	CreateRemote (see page 416)	This is CreateRemote, a member of class CoSearchAssistantOC.

8.1.3.2.1 CoSearchAssistantOC.Create Method

Pascal

```
class function Create: ISearchAssistantOC3;
```

C++

```
__fastcall ISearchAssistantOC3 Create();
```

Description

This is Create, a member of class CoSearchAssistantOC.

8.1.3.2.2 CoSearchAssistantOC.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): ISearchAssistantOC3;
```

C++

```
__fastcall ISearchAssistantOC3 CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoSearchAssistantOC.

8.1.4 CoShellBrowserWindow Class

Class Hierarchy

Pascal

```
CoShellBrowserWindow = class;
```

C++

```
class CoShellBrowserWindow;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellBrowserWindow.

8.1.4.1 CoShellBrowserWindow Members

The following tables list the members exposed by CoShellBrowserWindow.

Public Methods

	Name	Description
	Create (see page 417)	This is Create, a member of class CoShellBrowserWindow.
	CreateRemote (see page 418)	This is CreateRemote, a member of class CoShellBrowserWindow.

8.1.4.2 CoShellBrowserWindow Methods

The methods of the CoShellBrowserWindow class are listed here.

Public Methods

	Name	Description
	Create (see page 417)	This is Create, a member of class CoShellBrowserWindow.
	CreateRemote (see page 418)	This is CreateRemote, a member of class CoShellBrowserWindow.

8.1.4.2.1 CoShellBrowserWindow.Create Method

Pascal

```
class function Create: IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 Create();
```

Description

This is Create, a member of class CoShellBrowserWindow.

8.1.4.2.2 CoShellBrowserWindow.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoShellBrowserWindow.

8.1.5 CoShellNameSpace Class

Class Hierarchy

Pascal

```
CoShellNameSpace = class;
```

C++

```
class CoShellNameSpace;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellNameSpace.

8.1.5.1 CoShellNameSpace Members

The following tables list the members exposed by CoShellNameSpace.

Public Methods

	Name	Description
	Create (see page 419)	This is Create, a member of class CoShellNameSpace.
	CreateRemote (see page 419)	This is CreateRemote, a member of class CoShellNameSpace.

8.1.5.2 CoShellNameSpace Methods

The methods of the CoShellNameSpace class are listed here.

Public Methods

	Name	Description
	Create (see page 419)	This is Create, a member of class CoShellNameSpace.
	CreateRemote (see page 419)	This is CreateRemote, a member of class CoShellNameSpace.

8.1.5.2.1 CoShellNameSpace.Create Method

Pascal

```
class function Create: IShellNameSpace;
```

C++

```
__fastcall IShellNameSpace Create();
```

Description

This is Create, a member of class CoShellNameSpace.

8.1.5.2.2 CoShellNameSpace.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellNameSpace;
```

C++

```
__fastcall IShellNameSpace CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoShellNameSpace.

8.1.6 CoShellUIHelper Class

Class Hierarchy

SHDocVw.CoShellUIHelper

Pascal

```
CoShellUIHelper = class;
```

C++

```
class CoShellUIHelper;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellUIHelper.

8.1.6.1 CoShellUIHelper Members

The following tables list the members exposed by CoShellUIHelper.

Public Methods

	Name	Description
	Create (see page 420)	This is Create, a member of class CoShellUIHelper.
	CreateRemote (see page 420)	This is CreateRemote, a member of class CoShellUIHelper.

8.1.6.2 CoShellUIHelper Methods

The methods of the CoShellUIHelper class are listed here.

Public Methods

	Name	Description
	Create (see page 420)	This is Create, a member of class CoShellUIHelper.
	CreateRemote (see page 420)	This is CreateRemote, a member of class CoShellUIHelper.

8.1.6.2.1 CoShellUIHelper.Create Method

Pascal

```
class function Create: IShellUIHelper;
```

C++

```
__fastcall IShellUIHelper Create();
```

Description

This is Create, a member of class CoShellUIHelper.

8.1.6.2.2 CoShellUIHelper.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellUIHelper;
```

C++

```
__fastcall IShellUIHelper CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoShellUIHelper.

8.1.7 CoShellWindows Class

Class Hierarchy

Pascal

```
CoShellWindows = class;
```

C++

```
class CoShellWindows;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellWindows.

8.1.7.1 CoShellWindows Members

The following tables list the members exposed by CoShellWindows.

Public Methods

	Name	Description
	Create (see page 421)	This is Create, a member of class CoShellWindows.
	CreateRemote (see page 421)	This is CreateRemote, a member of class CoShellWindows.

8.1.7.2 CoShellWindows Methods

The methods of the CoShellWindows class are listed here.

Public Methods

	Name	Description
	Create (see page 421)	This is Create, a member of class CoShellWindows.
	CreateRemote (see page 421)	This is CreateRemote, a member of class CoShellWindows.

8.1.7.2.1 CoShellWindows.Create Method

Pascal

```
class function Create: IShellWindows;
```

C++

```
__fastcall IShellWindows Create();
```

Description

This is Create, a member of class CoShellWindows.

8.1.7.2.2 CoShellWindows.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellWindows;
```

C++

```
__fastcall IShellWindows CreateRemote(const UnicodeString MachineName);
```

Description

This is CreateRemote, a member of class CoShellWindows.

8.1.8 TInternetExplorer Class

Class Hierarchy

Pascal

```
TInternetExplorer = class(TOleServer);
```

C++

```
class TInternetExplorer : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TInternetExplorer.

8.1.8.1 TInternetExplorer Members

The following tables list the members exposed by TInternetExplorer.

Protected Methods

	Name	Description
	Get_AddressBar (see page 430)	This is Get_AddressBar, a member of class TInternetExplorer.
	Get_Application (see page 430)	This is Get_Application, a member of class TInternetExplorer.
	Get_Busy (see page 430)	This is Get_Busy, a member of class TInternetExplorer.
	Get_Container (see page 431)	This is Get_Container, a member of class TInternetExplorer.
	Get_Document (see page 431)	This is Get_Document, a member of class TInternetExplorer.
	Get_FullName (see page 431)	This is Get_FullName, a member of class TInternetExplorer.
	Get_FullScreen (see page 431)	This is Get_FullScreen, a member of class TInternetExplorer.
	Get_Height (see page 431)	This is Get_Height, a member of class TInternetExplorer.
	Get_HWnd (see page 432)	This is Get_HWnd, a member of class TInternetExplorer.
	Get_Left (see page 432)	This is Get_Left, a member of class TInternetExplorer.
	Get_LocationName (see page 432)	This is Get_LocationName, a member of class TInternetExplorer.
	Get_LocationURL (see page 432)	This is Get_LocationURL, a member of class TInternetExplorer.
	Get_MenuBar (see page 433)	This is Get_MenuBar, a member of class TInternetExplorer.
	Get_Name (see page 433)	This is Get_Name, a member of class TInternetExplorer.
	Get_Offline (see page 433)	This is Get_Offline, a member of class TInternetExplorer.
	Get_Parent (see page 433)	This is Get_Parent, a member of class TInternetExplorer.
	Get_Path (see page 433)	This is Get_Path, a member of class TInternetExplorer.
	Get_ReadyState (see page 434)	This is Get_ReadyState, a member of class TInternetExplorer.
	Get_RegisterAsBrowser (see page 434)	This is Get_RegisterAsBrowser, a member of class TInternetExplorer.
	Get_RegisterAsDropTarget (see page 434)	This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.
	Get_Resizable (see page 434)	This is Get_Resizable, a member of class TInternetExplorer.
	Get_Silent (see page 435)	This is Get_Silent, a member of class TInternetExplorer.
	Get_StatusBar (see page 435)	This is Get_StatusBar, a member of class TInternetExplorer.
	Get_StatusText (see page 435)	This is Get_StatusText, a member of class TInternetExplorer.
	Get_TheaterMode (see page 435)	This is Get_TheaterMode, a member of class TInternetExplorer.
	Get_ToolBar (see page 435)	This is Get_ToolBar, a member of class TInternetExplorer.
	Get_Top (see page 436)	This is Get_Top, a member of class TInternetExplorer.
	Get_TopLevelContainer (see page 436)	This is Get_TopLevelContainer, a member of class TInternetExplorer.
	Get_type_ (see page 436)	This is Get_type_, a member of class TInternetExplorer.
	Get_Visible (see page 436)	This is Get_Visible, a member of class TInternetExplorer.
	Get_Width (see page 437)	This is Get_Width, a member of class TInternetExplorer.
	InitServerData (see page 438)	Initializes the ServerData property to reflect the type library information of the COM server.
	InvokeEvent (see page 438)	Dispatches an event from the COM server to the appropriate event handler.
	Set_AddressBar (see page 443)	This is Set_AddressBar, a member of class TInternetExplorer.
	Set_FullScreen (see page 444)	This is Set_FullScreen, a member of class TInternetExplorer.
	Set_Height (see page 444)	This is Set_Height, a member of class TInternetExplorer.
	Set_Left (see page 444)	This is Set_Left, a member of class TInternetExplorer.

	Set_MenuBar (see page 444)	This is Set_MenuBar, a member of class TInternetExplorer.
	Set_Offline (see page 444)	This is Set_Offline, a member of class TInternetExplorer.
	Set_RegisterAsBrowser (see page 445)	This is Set_RegisterAsBrowser, a member of class TInternetExplorer.
	Set_RegisterAsDropTarget (see page 445)	This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.
	Set_Resizable (see page 445)	This is Set_Resizable, a member of class TInternetExplorer.
	Set_Silent (see page 445)	This is Set_Silent, a member of class TInternetExplorer.
	Set_StatusBar (see page 446)	This is Set_StatusBar, a member of class TInternetExplorer.
	Set_StatusText (see page 446)	This is Set_StatusText, a member of class TInternetExplorer.
	Set_TheaterMode (see page 446)	This is Set_TheaterMode, a member of class TInternetExplorer.
	Set_ToolBar (see page 446)	This is Set_ToolBar, a member of class TInternetExplorer.
	Set_Top (see page 446)	This is Set_Top, a member of class TInternetExplorer.
	Set_Visible (see page 447)	This is Set_Visible, a member of class TInternetExplorer.
	Set_Width (see page 447)	This is Set_Width, a member of class TInternetExplorer.

Public Methods

	Name	Description
	ClientToWindow (see page 428)	This is ClientToWindow, a member of class TInternetExplorer.
V	Connect (see page 428)	Establishes a connection to the COM server.
	ConnectTo (see page 428)	This is ConnectTo, a member of class TInternetExplorer.
V	Create (see page 425)	Allocates memory and constructs a safely initialized instance of a component.
V	Destroy (see page 425)	Disposes of the component and its owned components.
V	Disconnect (see page 429)	Terminates the connection to the COM server.
	ExecWB (see page 429)	This is the overview for the ExecWB method overload.
	GetProperty (see page 437)	This is GetProperty, a member of class TInternetExplorer.
	GoBack (see page 437)	This is GoBack, a member of class TInternetExplorer.
	GoForward (see page 437)	This is GoForward, a member of class TInternetExplorer.
	GoHome (see page 437)	This is GoHome, a member of class TInternetExplorer.
	GoSearch (see page 438)	This is GoSearch, a member of class TInternetExplorer.
	Navigate (see page 439)	This is the overview for the Navigate method overload.
	Navigate2 (see page 440)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 442)	This is PutProperty, a member of class TInternetExplorer.
	QueryStatusWB (see page 442)	This is QueryStatusWB, a member of class TInternetExplorer.
	Quit (see page 442)	This is Quit, a member of class TInternetExplorer.
	Refresh (see page 442)	This is Refresh, a member of class TInternetExplorer.
	Refresh2 (see page 443)	This is the overview for the Refresh2 method overload.
	ShowBrowserBar (see page 447)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 448)	This is Stop, a member of class TInternetExplorer.

Public Properties

	Name	Description
	AddressBar (see page 449)	This is AddressBar, a member of class TInternetExplorer.
R	Application (see page 449)	This is Application, a member of class TInternetExplorer.
R	Busy (see page 449)	This is Busy, a member of class TInternetExplorer.
R	Container (see page 450)	This is Container, a member of class TInternetExplorer.
R	DefaultInterface (see page 450)	This is DefaultInterface, a member of class TInternetExplorer.
R	Document (see page 450)	This is Document, a member of class TInternetExplorer.
R	FullName (see page 450)	This is FullName, a member of class TInternetExplorer.
	FullScreen (see page 450)	This is FullScreen, a member of class TInternetExplorer.
	Height (see page 451)	This is Height, a member of class TInternetExplorer.
R	HWnd (see page 451)	This is HWnd, a member of class TInternetExplorer.
	Left (see page 451)	This is Left, a member of class TInternetExplorer.
R	LocationName (see page 451)	This is LocationName, a member of class TInternetExplorer.
R	LocationURL (see page 452)	This is LocationURL, a member of class TInternetExplorer.
	MenuBar (see page 452)	This is MenuBar, a member of class TInternetExplorer.
R	Name (see page 452)	Specifies the name of the component as referenced in code.

	Offline (see page 454)	This is Offline, a member of class TInternetExplorer.
R	Parent (see page 454)	This is Parent, a member of class TInternetExplorer.
R	Path (see page 455)	This is Path, a member of class TInternetExplorer.
R	ReadyState (see page 455)	This is ReadyState, a member of class TInternetExplorer.
	RegisterAsBrowser (see page 455)	This is RegisterAsBrowser, a member of class TInternetExplorer.
	RegisterAsDropTarget (see page 455)	This is RegisterAsDropTarget, a member of class TInternetExplorer.
	Resizable (see page 455)	This is Resizable, a member of class TInternetExplorer.
	Silent (see page 456)	This is Silent, a member of class TInternetExplorer.
	StatusBar (see page 456)	This is StatusBar, a member of class TInternetExplorer.
	StatusText (see page 456)	This is StatusText, a member of class TInternetExplorer.
	TheaterMode (see page 456)	This is TheaterMode, a member of class TInternetExplorer.
	ToolBar (see page 457)	This is ToolBar, a member of class TInternetExplorer.
	Top (see page 457)	This is Top, a member of class TInternetExplorer.
R	TopLevelContainer (see page 457)	This is TopLevelContainer, a member of class TInternetExplorer.
R	type_ (see page 457)	This is type_, a member of class TInternetExplorer.
	Visible (see page 457)	This is Visible, a member of class TInternetExplorer.
	Width (see page 458)	This is Width, a member of class TInternetExplorer.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 459)	This is OnBeforeNavigate2, a member of class TInternetExplorer.
	OnClientToHostWindow (see page 459)	This is OnClientToHostWindow, a member of class TInternetExplorer.
	OnCommandStateChange (see page 459)	This is OnCommandStateChange, a member of class TInternetExplorer.
	OnDocumentComplete (see page 459)	This is OnDocumentComplete, a member of class TInternetExplorer.
	OnDownloadBegin (see page 459)	This is OnDownloadBegin, a member of class TInternetExplorer.
	OnDownloadComplete (see page 460)	This is OnDownloadComplete, a member of class TInternetExplorer.
	OnFileDownload (see page 460)	This is OnFileDownload, a member of class TInternetExplorer.
	OnFullScreen (see page 460)	This is OnFullScreen, a member of class TInternetExplorer.
	OnMenuBar (see page 460)	This is OnMenuBar, a member of class TInternetExplorer.
	OnNavigateComplete2 (see page 461)	This is OnNavigateComplete2, a member of class TInternetExplorer.
	OnNavigateError (see page 461)	This is OnNavigateError, a member of class TInternetExplorer.
	OnNewWindow2 (see page 461)	This is OnNewWindow2, a member of class TInternetExplorer.
	OnPrintTemplateInstantiation (see page 461)	This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.
	OnPrintTemplateTeardown (see page 461)	This is OnPrintTemplateTeardown, a member of class TInternetExplorer.
	OnPrivacyImpactedStateChange (see page 462)	This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.
	OnProgressChange (see page 462)	This is OnProgressChange, a member of class TInternetExplorer.
	OnPropertyChange (see page 462)	This is OnPropertyChange, a member of class TInternetExplorer.
	OnQuit (see page 462)	This is OnQuit, a member of class TInternetExplorer.
	OnSetSecureLockIcon (see page 463)	This is OnSetSecureLockIcon, a member of class TInternetExplorer.
	OnStatusBar (see page 463)	This is OnStatusBar, a member of class TInternetExplorer.
	OnStatusTextChange (see page 463)	This is OnStatusTextChange, a member of class TInternetExplorer.
	OnTheaterMode (see page 463)	This is OnTheaterMode, a member of class TInternetExplorer.
	OnTitleChange (see page 463)	This is OnTitleChange, a member of class TInternetExplorer.
	OnToolBar (see page 464)	This is OnToolBar, a member of class TInternetExplorer.
	OnUpdatePageStatus (see page 464)	This is OnUpdatePageStatus, a member of class TInternetExplorer.
	OnVisible (see page 464)	This is OnVisible, a member of class TInternetExplorer.
	OnWindowClosing (see page 464)	This is OnWindowClosing, a member of class TInternetExplorer.
	OnWindowSetHeight (see page 465)	This is OnWindowSetHeight, a member of class TInternetExplorer.
	OnWindowSetLeft (see page 465)	This is OnWindowSetLeft, a member of class TInternetExplorer.
	OnWindowSetResizable (see page 465)	This is OnWindowSetResizable, a member of class TInternetExplorer.
	OnWindowSetTop (see page 465)	This is OnWindowSetTop, a member of class TInternetExplorer.
	OnWindowSetWidth (see page 465)	This is OnWindowSetWidth, a member of class TInternetExplorer.

8.1.8.2 TInternetExplorer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInternetExplorer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Destroy

System::TObject::Free (see page 3372)

Owner

8.1.8.3 TInternetExplorer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TInternetExplorer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

8.1.8.4 TInternetExplorer Methods

The methods of the TInternetExplorer class are listed here.

Protected Methods

	Name	Description
	Get_AddressBar (see page 430)	This is Get_AddressBar, a member of class TInternetExplorer.
	Get_Application (see page 430)	This is Get_Application, a member of class TInternetExplorer.
	Get_Busy (see page 430)	This is Get_Busy, a member of class TInternetExplorer.
	Get_Container (see page 431)	This is Get_Container, a member of class TInternetExplorer.
	Get_Document (see page 431)	This is Get_Document, a member of class TInternetExplorer.
	Get_FullName (see page 431)	This is Get_FullName, a member of class TInternetExplorer.
	Get_FullScreen (see page 431)	This is Get_FullScreen, a member of class TInternetExplorer.
	Get_Height (see page 431)	This is Get_Height, a member of class TInternetExplorer.
	Get_HWnd (see page 432)	This is Get_HWnd, a member of class TInternetExplorer.
	Get_Left (see page 432)	This is Get_Left, a member of class TInternetExplorer.
	Get_LocationName (see page 432)	This is Get_LocationName, a member of class TInternetExplorer.
	Get_LocationURL (see page 432)	This is Get_LocationURL, a member of class TInternetExplorer.
	Get_MenuBar (see page 433)	This is Get_MenuBar, a member of class TInternetExplorer.
	Get_Name (see page 433)	This is Get_Name, a member of class TInternetExplorer.
	Get_Offline (see page 433)	This is Get_Offline, a member of class TInternetExplorer.
	Get_Parent (see page 433)	This is Get_Parent, a member of class TInternetExplorer.
	Get_Path (see page 433)	This is Get_Path, a member of class TInternetExplorer.
	Get_ReadyState (see page 434)	This is Get_ReadyState, a member of class TInternetExplorer.

	Get_RegisterAsBrowser (see page 434)	This is Get_RegisterAsBrowser, a member of class TInternetExplorer.
	Get_RegisterAsDropTarget (see page 434)	This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.
	Get_Resizable (see page 434)	This is Get_Resizable, a member of class TInternetExplorer.
	Get_Silent (see page 435)	This is Get_Silent, a member of class TInternetExplorer.
	Get_StatusBar (see page 435)	This is Get_StatusBar, a member of class TInternetExplorer.
	Get_StatusText (see page 435)	This is Get_StatusText, a member of class TInternetExplorer.
	Get_TheaterMode (see page 435)	This is Get_TheaterMode, a member of class TInternetExplorer.
	Get_ToolBar (see page 435)	This is Get_ToolBar, a member of class TInternetExplorer.
	Get_Top (see page 436)	This is Get_Top, a member of class TInternetExplorer.
	Get_TopLevelContainer (see page 436)	This is Get_TopLevelContainer, a member of class TInternetExplorer.
	Get_type_ (see page 436)	This is Get_type_, a member of class TInternetExplorer.
	Get_Visible (see page 436)	This is Get_Visible, a member of class TInternetExplorer.
	Get_Width (see page 437)	This is Get_Width, a member of class TInternetExplorer.
	InitServerData (see page 438)	Initializes the ServerData property to reflect the type library information of the COM server.
	InvokeEvent (see page 438)	Dispatches an event from the COM server to the appropriate event handler.
	Set_AddressBar (see page 443)	This is Set_AddressBar, a member of class TInternetExplorer.
	Set_FullScreen (see page 444)	This is Set_FullScreen, a member of class TInternetExplorer.
	Set_Height (see page 444)	This is Set_Height, a member of class TInternetExplorer.
	Set_Left (see page 444)	This is Set_Left, a member of class TInternetExplorer.
	Set_MenuBar (see page 444)	This is Set_MenuBar, a member of class TInternetExplorer.
	Set_Offline (see page 444)	This is Set_Offline, a member of class TInternetExplorer.
	Set_RegisterAsBrowser (see page 445)	This is Set_RegisterAsBrowser, a member of class TInternetExplorer.
	Set_RegisterAsDropTarget (see page 445)	This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.
	Set_Resizable (see page 445)	This is Set_Resizable, a member of class TInternetExplorer.
	Set_Silent (see page 445)	This is Set_Silent, a member of class TInternetExplorer.
	Set_StatusBar (see page 446)	This is Set_StatusBar, a member of class TInternetExplorer.
	Set_StatusText (see page 446)	This is Set_StatusText, a member of class TInternetExplorer.
	Set_TheaterMode (see page 446)	This is Set_TheaterMode, a member of class TInternetExplorer.
	Set_ToolBar (see page 446)	This is Set_ToolBar, a member of class TInternetExplorer.
	Set_Top (see page 446)	This is Set_Top, a member of class TInternetExplorer.
	Set_Visible (see page 447)	This is Set_Visible, a member of class TInternetExplorer.
	Set_Width (see page 447)	This is Set_Width, a member of class TInternetExplorer.

Public Methods

	Name	Description
	ClientToWindow (see page 428)	This is ClientToWindow, a member of class TInternetExplorer.
	Connect (see page 428)	Establishes a connection to the COM server.
	ConnectTo (see page 428)	This is ConnectTo, a member of class TInternetExplorer.
	Disconnect (see page 429)	Terminates the connection to the COM server.
	ExecWB (see page 429)	This is the overview for the ExecWB method overload.
	GetProperty (see page 437)	This is GetProperty, a member of class TInternetExplorer.
	GoBack (see page 437)	This is GoBack, a member of class TInternetExplorer.
	GoForward (see page 437)	This is GoForward, a member of class TInternetExplorer.
	GoHome (see page 437)	This is GoHome, a member of class TInternetExplorer.
	GoSearch (see page 438)	This is GoSearch, a member of class TInternetExplorer.
	Navigate (see page 439)	This is the overview for the Navigate method overload.
	Navigate2 (see page 440)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 442)	This is PutProperty, a member of class TInternetExplorer.
	QueryStatusWB (see page 442)	This is QueryStatusWB, a member of class TInternetExplorer.
	Quit (see page 442)	This is Quit, a member of class TInternetExplorer.
	Refresh (see page 442)	This is Refresh, a member of class TInternetExplorer.
	Refresh2 (see page 443)	This is the overview for the Refresh2 method overload.
	ShowBrowserBar (see page 447)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 448)	This is Stop, a member of class TInternetExplorer.

8.1.8.4.1 TInternetExplorer.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class TInternetExplorer.

8.1.8.4.2 TInternetExplorer.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

Using Component Wrappers

8.1.8.4.3 TInternetExplorer.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IWebBrowser2);
```

C++

```
__fastcall ConnectTo(IWebBrowser2 svrIntf);
```

Description

This is ConnectTo, a member of class TInternetExplorer.

8.1.8.4.4 TInternetExplorer.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

Connect

Using Component Wrappers

8.1.8.4.5 ExecWB Method

This is the overview for the ExecWB method overload.

Overload List

	Name	Description
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT) (see page 429)	This is ExecWB, a member of class TInternetExplorer.
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant) (see page 429)	This is ExecWB, a member of class TInternetExplorer.
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant) (see page 430)	This is ExecWB, a member of class TInternetExplorer.

8.1.8.4.5.1 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt);
```

Description

This is ExecWB, a member of class TInternetExplorer.

8.1.8.4.5.2 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT, OleVariant)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn);
```

Description

This is ExecWB, a member of class TInternetExplorer.

8.1.8.4.5.3 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

This is ExecWB, a member of class TInternetExplorer.

8.1.8.4.6 TInternetExplorer.Get_AddressBar Method

Pascal

```
function Get_AddressBar: WordBool;
```

C++

```
__fastcall WordBool Get_AddressBar();
```

Description

This is Get_AddressBar, a member of class TInternetExplorer.

8.1.8.4.7 TInternetExplorer.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TInternetExplorer.

8.1.8.4.8 TInternetExplorer.Get_Busy Method

Pascal

```
function Get_Busy: WordBool;
```

C++

```
__fastcall WordBool Get_Busy();
```

Description

This is Get_Busy, a member of class TInternetExplorer.

8.1.8.4.9 TInternetExplorer.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TInternetExplorer.

8.1.8.4.10 TInternetExplorer.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TInternetExplorer.

8.1.8.4.11 TInternetExplorer.Get_FullName Method

Pascal

```
function Get_FullName: WideString;
```

C++

```
__fastcall BSTR Get_FullName();
```

Description

This is Get_FullName, a member of class TInternetExplorer.

8.1.8.4.12 TInternetExplorer.Get_FullScreen Method

Pascal

```
function Get_FullScreen: WordBool;
```

C++

```
__fastcall WordBool Get_FullScreen();
```

Description

This is Get_FullScreen, a member of class TInternetExplorer.

8.1.8.4.13 TInternetExplorer.Get_Height Method

Pascal

```
function Get_Height: Integer;
```

C++

```
__fastcall int Get_Height();
```

Description

This is Get_Height, a member of class TInternetExplorer.

8.1.8.4.14 TInternetExplorer.Get_HWnd Method

Pascal

```
function Get_HWnd: Integer;
```

C++

```
__fastcall int Get_HWnd();
```

Description

This is Get_HWnd, a member of class TInternetExplorer.

8.1.8.4.15 TInternetExplorer.Get_Left Method

Pascal

```
function Get_Left: Integer;
```

C++

```
__fastcall int Get_Left();
```

Description

This is Get_Left, a member of class TInternetExplorer.

8.1.8.4.16 TInternetExplorer.Get_LocationName Method

Pascal

```
function Get_LocationName: WideString;
```

C++

```
__fastcall BSTR Get_LocationName();
```

Description

This is Get_LocationName, a member of class TInternetExplorer.

8.1.8.4.17 TInternetExplorer.Get_LocationURL Method

Pascal

```
function Get_LocationURL: WideString;
```

C++

```
__fastcall BSTR Get_LocationURL();
```

Description

This is Get_LocationURL, a member of class TInternetExplorer.

8.1.8.4.18 TInternetExplorer.Get_MenuBar Method

Pascal

```
function Get_MenuBar: WordBool;
```

C++

```
__fastcall WordBool Get_MenuBar();
```

Description

This is Get_MenuBar, a member of class TInternetExplorer.

8.1.8.4.19 TInternetExplorer.Get_Name Method

Pascal

```
function Get_Name: WideString;
```

C++

```
__fastcall BSTR Get_Name();
```

Description

This is Get_Name, a member of class TInternetExplorer.

8.1.8.4.20 TInternetExplorer.Get_Offline Method

Pascal

```
function Get_Offline: WordBool;
```

C++

```
__fastcall WordBool Get_Offline();
```

Description

This is Get_Offline, a member of class TInternetExplorer.

8.1.8.4.21 TInternetExplorer.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TInternetExplorer.

8.1.8.4.22 TInternetExplorer.Get_Path Method

Pascal

```
function Get_Path: WideString;
```

C++

```
__fastcall BSTR Get_Path();
```

Description

This is Get_Path, a member of class TInternetExplorer.

8.1.8.4.23 TInternetExplorer.Get_ReadyState Method

Pascal

```
function Get_ReadyState: tagREADYSTATE;
```

C++

```
__fastcall tagREADYSTATE Get_ReadyState();
```

Description

This is Get_ReadyState, a member of class TInternetExplorer.

8.1.8.4.24 TInternetExplorer.Get_RegisterAsBrowser Method

Pascal

```
function Get_RegisterAsBrowser: WordBool;
```

C++

```
__fastcall WordBool Get_RegisterAsBrowser();
```

Description

This is Get_RegisterAsBrowser, a member of class TInternetExplorer.

8.1.8.4.25 TInternetExplorer.Get_RegisterAsDropTarget Method

Pascal

```
function Get_RegisterAsDropTarget: WordBool;
```

C++

```
__fastcall WordBool Get_RegisterAsDropTarget();
```

Description

This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.

8.1.8.4.26 TInternetExplorer.Get_Resizable Method

Pascal

```
function Get_Resizable: WordBool;
```

C++

```
__fastcall WordBool Get_Resizable();
```

Description

This is Get_Resizable, a member of class TInternetExplorer.

8.1.8.4.27 TInternetExplorer.Get_Silent Method

Pascal

```
function Get_Silent: WordBool;
```

C++

```
__fastcall WordBool Get_Silent();
```

Description

This is Get_Silent, a member of class TInternetExplorer.

8.1.8.4.28 TInternetExplorer.Get_StatusBar Method

Pascal

```
function Get_StatusBar: WordBool;
```

C++

```
__fastcall WordBool Get_StatusBar();
```

Description

This is Get_StatusBar, a member of class TInternetExplorer.

8.1.8.4.29 TInternetExplorer.Get_StatusText Method

Pascal

```
function Get_StatusText: WideString;
```

C++

```
__fastcall BSTR Get_StatusText();
```

Description

This is Get_StatusText, a member of class TInternetExplorer.

8.1.8.4.30 TInternetExplorer.Get_TheaterMode Method

Pascal

```
function Get_TheaterMode: WordBool;
```

C++

```
__fastcall WordBool Get_TheaterMode();
```

Description

This is Get_TheaterMode, a member of class TInternetExplorer.

8.1.8.4.31 TInternetExplorer.Get_ToolBar Method

Pascal

```
function Get_ToolBar: SYSINT;
```

C++

```
__fastcall SYSINT Get_ToolBar();
```

Description

This is Get_ToolBar, a member of class TInternetExplorer.

8.1.8.4.32 TInternetExplorer.Get_Top Method

Pascal

```
function Get_Top: Integer;
```

C++

```
__fastcall int Get_Top();
```

Description

This is Get_Top, a member of class TInternetExplorer.

8.1.8.4.33 TInternetExplorer.Get_TopLevelContainer Method

Pascal

```
function Get_TopLevelContainer: WordBool;
```

C++

```
__fastcall WordBool Get_TopLevelContainer();
```

Description

This is Get_TopLevelContainer, a member of class TInternetExplorer.

8.1.8.4.34 TInternetExplorer.Get_type_ Method

Pascal

```
function Get_type_: WideString;
```

C++

```
__fastcall BSTR Get_type_();
```

Description

This is Get_type_, a member of class TInternetExplorer.

8.1.8.4.35 TInternetExplorer.Get_Visible Method

Pascal

```
function Get_Visible: WordBool;
```

C++

```
__fastcall WordBool Get_Visible();
```

Description

This is Get_Visible, a member of class TInternetExplorer.

8.1.8.4.36 TInternetExplorer.Get_Width Method

Pascal

```
function Get_Width: Integer;
```

C++

```
__fastcall int Get_Width();
```

Description

This is Get_Width, a member of class TInternetExplorer.

8.1.8.4.37 TInternetExplorer.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class TInternetExplorer.

8.1.8.4.38 TInternetExplorer.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class TInternetExplorer.

8.1.8.4.39 TInternetExplorer.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class TInternetExplorer.

8.1.8.4.40 TInternetExplorer.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class TInternetExplorer.

8.1.8.4.41 TInternetExplorer.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class TInternetExplorer.

8.1.8.4.42 TInternetExplorer.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

See Also

ServerData

Create

8.1.8.4.43 TInternetExplorer.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the

appropriate event handlers.

EventDispatch

8.1.8.4.44 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TInternetExplorer.Navigate (WideString) (see page 439)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant) (see page 439)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant) (see page 439)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 440)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 440)	This is Navigate, a member of class TInternetExplorer.

8.1.8.4.44.1 TInternetExplorer.Navigate Method (WideString)

Pascal

```
procedure Navigate(const URL: WideString); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
```

Description

This is Navigate, a member of class TInternetExplorer.

8.1.8.4.44.2 TInternetExplorer.Navigate Method (WideString, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
```

Description

This is Navigate, a member of class TInternetExplorer.

8.1.8.4.44.3 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
```

Description

This is Navigate, a member of class TInternetExplorer.

8.1.8.4.44.4 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
```

Description

This is Navigate, a member of class TInternetExplorer.

8.1.8.4.44.5 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class TInternetExplorer.

8.1.8.4.45 Navigate2 Method

This is the overview for the Navigate2 method overload.

Overload List

	Name	Description
	TInternetExplorer.Navigate2 (OleVariant) (see page 441)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant) (see page 441)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant) (see page 441)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant) (see page 441)	This is Navigate2, a member of class TInternetExplorer.

	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant) (see page 442)	This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.45.1 TInternetExplorer.Navigate2 Method (OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL);
```

Description

This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.45.2 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags);
```

Description

This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.45.3 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName);
```

Description

This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.45.4 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData);
```

Description

This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.45.5 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant; var Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData, OleVariant Headers);
```

Description

This is Navigate2, a member of class TInternetExplorer.

8.1.8.4.46 TInternetExplorer.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class TInternetExplorer.

8.1.8.4.47 TInternetExplorer.QueryStatusWB Method

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

This is QueryStatusWB, a member of class TInternetExplorer.

8.1.8.4.48 TInternetExplorer.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class TInternetExplorer.

8.1.8.4.49 TInternetExplorer.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class TInternetExplorer.

8.1.8.4.50 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TInternetExplorer.Refresh2 () (see page 443)	This is Refresh2, a member of class TInternetExplorer.
	TInternetExplorer.Refresh2 (OleVariant) (see page 443)	This is Refresh2, a member of class TInternetExplorer.

8.1.8.4.50.1 TInternetExplorer.Refresh2 Method ()

Pascal

```
procedure Refresh2; overload;
```

C++

```
__fastcall Refresh2();
```

Description

This is Refresh2, a member of class TInternetExplorer.

8.1.8.4.50.2 TInternetExplorer.Refresh2 Method (OleVariant)

Pascal

```
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class TInternetExplorer.

8.1.8.4.51 TInternetExplorer.Set_AddressBar Method

Pascal

```
procedure Set_AddressBar(Value: WordBool);
```

C++

```
__fastcall Set_AddressBar(WordBool Value);
```

Description

This is Set_AddressBar, a member of class TInternetExplorer.

8.1.8.4.52 TInternetExplorer.Set_FullScreen Method

Pascal

```
procedure Set_FullScreen(pbFullScreen: WordBool);
```

C++

```
__fastcall Set_FullScreen(WordBool pbFullScreen);
```

Description

This is Set_FullScreen, a member of class TInternetExplorer.

8.1.8.4.53 TInternetExplorer.Set_Height Method

Pascal

```
procedure Set_Height(pl: Integer);
```

C++

```
__fastcall Set_Height(int pl);
```

Description

This is Set_Height, a member of class TInternetExplorer.

8.1.8.4.54 TInternetExplorer.Set_Left Method

Pascal

```
procedure Set_Left(pl: Integer);
```

C++

```
__fastcall Set_Left(int pl);
```

Description

This is Set_Left, a member of class TInternetExplorer.

8.1.8.4.55 TInternetExplorer.Set_MenuBar Method

Pascal

```
procedure Set_MenuBar(Value: WordBool);
```

C++

```
__fastcall Set_MenuBar(WordBool Value);
```

Description

This is Set_MenuBar, a member of class TInternetExplorer.

8.1.8.4.56 TInternetExplorer.Set_Offline Method

Pascal

```
procedure Set_Offline(pbOffline: WordBool);
```

C++

```
__fastcall Set_Offline(WordBool pbOffline);
```

Description

This is Set_Offline, a member of class TInternetExplorer.

8.1.8.4.57 TInternetExplorer.Set_RegisterAsBrowser Method

Pascal

```
procedure Set_RegisterAsBrowser(pbRegister: WordBool);
```

C++

```
__fastcall Set_RegisterAsBrowser(WordBool pbRegister);
```

Description

This is Set_RegisterAsBrowser, a member of class TInternetExplorer.

8.1.8.4.58 TInternetExplorer.Set_RegisterAsDropTarget Method

Pascal

```
procedure Set_RegisterAsDropTarget(pbRegister: WordBool);
```

C++

```
__fastcall Set_RegisterAsDropTarget(WordBool pbRegister);
```

Description

This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.

8.1.8.4.59 TInternetExplorer.Set_Resizable Method

Pascal

```
procedure Set_Resizable(Value: WordBool);
```

C++

```
__fastcall Set_Resizable(WordBool Value);
```

Description

This is Set_Resizable, a member of class TInternetExplorer.

8.1.8.4.60 TInternetExplorer.Set_Silent Method

Pascal

```
procedure Set_Silent(pbSilent: WordBool);
```

C++

```
__fastcall Set_Silent(WordBool pbSilent);
```

Description

This is Set_Silent, a member of class TInternetExplorer.

8.1.8.4.61 TInternetExplorer.Set_StatusBar Method

Pascal

```
procedure Set_StatusBar(pBool: WordBool);
```

C++

```
__fastcall Set_StatusBar(WordBool pBool);
```

Description

This is Set_StatusBar, a member of class TInternetExplorer.

8.1.8.4.62 TInternetExplorer.Set_StatusText Method

Pascal

```
procedure Set_StatusText(const StatusText: WideString);
```

C++

```
__fastcall Set_StatusText(const BSTR StatusText);
```

Description

This is Set_StatusText, a member of class TInternetExplorer.

8.1.8.4.63 TInternetExplorer.Set_TheaterMode Method

Pascal

```
procedure Set_TheaterMode(pbRegister: WordBool);
```

C++

```
__fastcall Set_TheaterMode(WordBool pbRegister);
```

Description

This is Set_TheaterMode, a member of class TInternetExplorer.

8.1.8.4.64 TInternetExplorer.Set_ToolBar Method

Pascal

```
procedure Set_ToolBar(Value: SYSINT);
```

C++

```
__fastcall Set_ToolBar(SYSINT Value);
```

Description

This is Set_ToolBar, a member of class TInternetExplorer.

8.1.8.4.65 TInternetExplorer.Set_Top Method

Pascal

```
procedure Set_Top(pl: Integer);
```

C++

```
__fastcall Set_Top(int pl);
```

Description

This is Set_Top, a member of class TInternetExplorer.

8.1.8.4.66 TInternetExplorer.Set_Visible Method

Pascal

```
procedure Set_Visible(pBool: WordBool);
```

C++

```
__fastcall Set_Visible(WordBool pBool);
```

Description

This is Set_Visible, a member of class TInternetExplorer.

8.1.8.4.67 TInternetExplorer.Set_Width Method

Pascal

```
procedure Set_Width(pl: Integer);
```

C++

```
__fastcall Set_Width(int pl);
```

Description

This is Set_Width, a member of class TInternetExplorer.

8.1.8.4.68 ShowBrowserBar Method

This is the overview for the ShowBrowserBar method overload.

Overload List

	Name	Description
	TInternetExplorer.ShowBrowserBar (OleVariant) (see page 447)	This is ShowBrowserBar, a member of class TInternetExplorer.
	TInternetExplorer.ShowBrowserBar (OleVariant, OleVariant) (see page 448)	This is ShowBrowserBar, a member of class TInternetExplorer.
	TInternetExplorer.ShowBrowserBar (OleVariant, OleVariant, OleVariant) (see page 448)	This is ShowBrowserBar, a member of class TInternetExplorer.

8.1.8.4.68.1 TInternetExplorer.ShowBrowserBar Method (OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

8.1.8.4.68.2 TInternetExplorer.ShowBrowserBar Method (OleVariant, OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

8.1.8.4.68.3 TInternetExplorer.ShowBrowserBar Method (OleVariant, OleVariant, OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

8.1.8.4.69 TInternetExplorer.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class TInternetExplorer.

8.1.8.5 TInternetExplorer Properties

The properties of the TInternetExplorer class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 449)	This is AddressBar, a member of class TInternetExplorer.
R	Application (see page 449)	This is Application, a member of class TInternetExplorer.
R	Busy (see page 449)	This is Busy, a member of class TInternetExplorer.
R	Container (see page 450)	This is Container, a member of class TInternetExplorer.
R	DefaultInterface (see page 450)	This is DefaultInterface, a member of class TInternetExplorer.
R	Document (see page 450)	This is Document, a member of class TInternetExplorer.
R	FullName (see page 450)	This is FullName, a member of class TInternetExplorer.
	FullScreen (see page 450)	This is FullScreen, a member of class TInternetExplorer.
	Height (see page 451)	This is Height, a member of class TInternetExplorer.
R	HWnd (see page 451)	This is HWnd, a member of class TInternetExplorer.
	Left (see page 451)	This is Left, a member of class TInternetExplorer.
R	LocationName (see page 451)	This is LocationName, a member of class TInternetExplorer.

R	LocationURL (see page 452)	This is LocationURL, a member of class TInternetExplorer.
	MenuBar (see page 452)	This is MenuBar, a member of class TInternetExplorer.
R	Name (see page 452)	Specifies the name of the component as referenced in code.
	Offline (see page 454)	This is Offline, a member of class TInternetExplorer.
R	Parent (see page 454)	This is Parent, a member of class TInternetExplorer.
R	Path (see page 455)	This is Path, a member of class TInternetExplorer.
R	ReadyState (see page 455)	This is ReadyState, a member of class TInternetExplorer.
	RegisterAsBrowser (see page 455)	This is RegisterAsBrowser, a member of class TInternetExplorer.
	RegisterAsDropTarget (see page 455)	This is RegisterAsDropTarget, a member of class TInternetExplorer.
	Resizable (see page 455)	This is Resizable, a member of class TInternetExplorer.
	Silent (see page 456)	This is Silent, a member of class TInternetExplorer.
	StatusBar (see page 456)	This is StatusBar, a member of class TInternetExplorer.
	StatusText (see page 456)	This is StatusText, a member of class TInternetExplorer.
	TheaterMode (see page 456)	This is TheaterMode, a member of class TInternetExplorer.
	ToolBar (see page 457)	This is ToolBar, a member of class TInternetExplorer.
	Top (see page 457)	This is Top, a member of class TInternetExplorer.
R	TopLevelContainer (see page 457)	This is TopLevelContainer, a member of class TInternetExplorer.
R	type_ (see page 457)	This is type_, a member of class TInternetExplorer.
	Visible (see page 457)	This is Visible, a member of class TInternetExplorer.
	Width (see page 458)	This is Width, a member of class TInternetExplorer.

8.1.8.5.1 TInternetExplorer.AddressBar Property

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

This is AddressBar, a member of class TInternetExplorer.

8.1.8.5.2 TInternetExplorer.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class TInternetExplorer.

8.1.8.5.3 TInternetExplorer.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class TInternetExplorer.

8.1.8.5.4 TInternetExplorer.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class TInternetExplorer.

8.1.8.5.5 TInternetExplorer.DefaultInterface Property

Pascal

```
property DefaultInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 DefaultInterface;
```

Description

This is DefaultInterface, a member of class TInternetExplorer.

8.1.8.5.6 TInternetExplorer.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class TInternetExplorer.

8.1.8.5.7 TInternetExplorer.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class TInternetExplorer.

8.1.8.5.8 TInternetExplorer.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class TInternetExplorer.

8.1.8.5.9 TInternetExplorer.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class TInternetExplorer.

8.1.8.5.10 TInternetExplorer.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class TInternetExplorer.

8.1.8.5.11 TInternetExplorer.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class TInternetExplorer.

8.1.8.5.12 TInternetExplorer.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class TInternetExplorer.

8.1.8.5.13 TInternetExplorer.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class TInternetExplorer.

8.1.8.5.14 TInternetExplorer.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class TInternetExplorer.

8.1.8.5.15 TInternetExplorer.Name Property

Specifies the name of the component as referenced in code.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Use Name to change the name of a component to reflect its purpose in the current application. By default, the IDE assigns sequential names based on the type of the component, such as 'Button1', 'Button2', and so on.

Use Name to refer to the component in code.

Warning: Changing Name at runtime causes any references to the old name to become undefined. Any subsequent code that uses the old name will cause an exception.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
```

```
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
                                  Components[i]->Name,
                                  dynamic_cast<TObject *>(Components[i]));
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  if (Button == mbRight)
  {
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = dynamic_cast<TControl *>(ListBox1->Items->Objects[Index]);
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
        break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
```

```
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
  APoint.X := X;
  APoint.Y := Y;
  Index := ListBox1.ItemAtPos(APoint, True);
  if (ListBox1.Items.Objects[Index] is TControl) then
  begin
    TheObject :=
      (ListBox1.Items.Objects[Index] as TControl);
    StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                             IntToStr(TheObject.Left) + ', ' +
                             IntToStr(TheObject.Top) + ') ';
  end
  else
    Beep;
  end;
end;

8.1.8.5.16 TInternetExplorer.Offline Property

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

This is Offline, a member of class TInternetExplorer.

8.1.8.5.17 TInternetExplorer.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class TInternetExplorer.

8.1.8.5.18 TInternetExplorer.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class TInternetExplorer.

8.1.8.5.19 TInternetExplorer.ReadyState Property

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

This is ReadyState, a member of class TInternetExplorer.

8.1.8.5.20 TInternetExplorer.RegisterAsBrowser Property

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

This is RegisterAsBrowser, a member of class TInternetExplorer.

8.1.8.5.21 TInternetExplorer.RegisterAsDropTarget Property

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

This is RegisterAsDropTarget, a member of class TInternetExplorer.

8.1.8.5.22 TInternetExplorer.Resizable Property

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

This is Resizable, a member of class TInternetExplorer.

8.1.8.5.23 TInternetExplorer.Silent Property

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

This is Silent, a member of class TInternetExplorer.

8.1.8.5.24 TInternetExplorer.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class TInternetExplorer.

8.1.8.5.25 TInternetExplorer.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class TInternetExplorer.

8.1.8.5.26 TInternetExplorer.TheaterMode Property

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

This is TheaterMode, a member of class TInternetExplorer.

8.1.8.5.27 TInternetExplorer.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class TInternetExplorer.

8.1.8.5.28 TInternetExplorer.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class TInternetExplorer.

8.1.8.5.29 TInternetExplorer.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class TInternetExplorer.

8.1.8.5.30 TInternetExplorer.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class TInternetExplorer.

8.1.8.5.31 TInternetExplorer.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class TInternetExplorer.

8.1.8.5.32 TInternetExplorer.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class TInternetExplorer.

8.1.8.6 TInternetExplorer Events

The events of the TInternetExplorer class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 459)	This is OnBeforeNavigate2, a member of class TInternetExplorer.
	OnClientToHostWindow (see page 459)	This is OnClientToHostWindow, a member of class TInternetExplorer.
	OnCommandStateChange (see page 459)	This is OnCommandStateChange, a member of class TInternetExplorer.
	OnDocumentComplete (see page 459)	This is OnDocumentComplete, a member of class TInternetExplorer.
	OnDownloadBegin (see page 459)	This is OnDownloadBegin, a member of class TInternetExplorer.
	OnDownloadComplete (see page 460)	This is OnDownloadComplete, a member of class TInternetExplorer.
	OnFileDownload (see page 460)	This is OnFileDownload, a member of class TInternetExplorer.
	OnFullScreen (see page 460)	This is OnFullScreen, a member of class TInternetExplorer.
	OnMenuBar (see page 460)	This is OnMenuBar, a member of class TInternetExplorer.
	OnNavigateComplete2 (see page 461)	This is OnNavigateComplete2, a member of class TInternetExplorer.
	OnNavigateError (see page 461)	This is OnNavigateError, a member of class TInternetExplorer.

	OnPrintTemplateInstantiation (see page 461)	This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.
	OnPrintTemplateTeardown (see page 461)	This is OnPrintTemplateTeardown, a member of class TInternetExplorer.
	OnPrivacyImpactedStateChange (see page 462)	This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.
	OnProgressChange (see page 462)	This is OnProgressChange, a member of class TInternetExplorer.
	OnPropertyChange (see page 462)	This is OnPropertyChange, a member of class TInternetExplorer.
	OnQuit (see page 462)	This is OnQuit, a member of class TInternetExplorer.
	OnSetSecureLockIcon (see page 463)	This is OnSetSecureLockIcon, a member of class TInternetExplorer.
	OnStatusBar (see page 463)	This is OnStatusBar, a member of class TInternetExplorer.
	OnStatusTextChange (see page 463)	This is OnStatusTextChange, a member of class TInternetExplorer.
	OnTheaterMode (see page 463)	This is OnTheaterMode, a member of class TInternetExplorer.
	OnTitleChange (see page 463)	This is OnTitleChange, a member of class TInternetExplorer.
	OnToolBar (see page 464)	This is OnToolBar, a member of class TInternetExplorer.
	OnUpdatePageStatus (see page 464)	This is OnUpdatePageStatus, a member of class TInternetExplorer.
	OnVisible (see page 464)	This is OnVisible, a member of class TInternetExplorer.
	OnWindowClosing (see page 464)	This is OnWindowClosing, a member of class TInternetExplorer.
	OnWindowSetHeight (see page 465)	This is OnWindowSetHeight, a member of class TInternetExplorer.
	OnWindowSetLeft (see page 465)	This is OnWindowSetLeft, a member of class TInternetExplorer.
	OnWindowSetResizable (see page 465)	This is OnWindowSetResizable, a member of class TInternetExplorer.
	OnWindowSetTop (see page 465)	This is OnWindowSetTop, a member of class TInternetExplorer.
	OnWindowSetWidth (see page 465)	This is OnWindowSetWidth, a member of class TInternetExplorer.

8.1.8.6.1 TInternetExplorer.OnBeforeNavigate2 Event

Pascal

```
property OnBeforeNavigate2: TInternetExplorerBeforeNavigate2;
```

C++

```
__property TInternetExplorerBeforeNavigate2 OnBeforeNavigate2;
```

Description

This is OnBeforeNavigate2, a member of class TInternetExplorer.

8.1.8.6.2 TInternetExplorer.OnClientToHostWindow Event

Pascal

```
property OnClientToHostWindow: TInternetExplorerClientToHostWindow;
```

C++

```
__property TInternetExplorerClientToHostWindow OnClientToHostWindow;
```

Description

This is OnClientToHostWindow, a member of class TInternetExplorer.

8.1.8.6.3 TInternetExplorer.OnCommandStateChange Event

Pascal

```
property OnCommandStateChange: TInternetExplorerCommandStateChange;
```

C++

```
__property TInternetExplorerCommandStateChange OnCommandStateChange;
```

Description

This is OnCommandStateChange, a member of class TInternetExplorer.

8.1.8.6.4 TInternetExplorer.OnDocumentComplete Event

Pascal

```
property OnDocumentComplete: TInternetExplorerDocumentComplete;
```

C++

```
__property TInternetExplorerDocumentComplete OnDocumentComplete;
```

Description

This is OnDocumentComplete, a member of class TInternetExplorer.

8.1.8.6.5 TInternetExplorer.OnDownloadBegin Event

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

This is OnDownloadBegin, a member of class TInternetExplorer.

8.1.8.6.6 TInternetExplorer.OnDownloadComplete Event

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

This is OnDownloadComplete, a member of class TInternetExplorer.

8.1.8.6.7 TInternetExplorer.OnFileDownload Event

Pascal

```
property OnFileDownload: TInternetExplorerFileDownload;
```

C++

```
__property TInternetExplorerFileDownload OnFileDownload;
```

Description

This is OnFileDownload, a member of class TInternetExplorer.

8.1.8.6.8 TInternetExplorer.OnFullScreen Event

Pascal

```
property OnFullScreen: TInternetExplorerOnFullScreen;
```

C++

```
__property TInternetExplorerOnFullScreen OnFullScreen;
```

Description

This is OnFullScreen, a member of class TInternetExplorer.

8.1.8.6.9 TInternetExplorer.OnMenuBar Event

Pascal

```
property OnMenuBar: TInternetExplorerOnMenuBar;
```

C++

```
__property TInternetExplorerOnMenuBar OnMenuBar;
```

Description

This is OnMenuBar, a member of class TInternetExplorer.

8.1.8.6.10 TInternetExplorer.OnNavigateComplete2 Event

Pascal

```
property OnNavigateComplete2: TInternetExplorerNavigateComplete2;
```

C++

```
__property TInternetExplorerNavigateComplete2 OnNavigateComplete2;
```

Description

This is OnNavigateComplete2, a member of class TInternetExplorer.

8.1.8.6.11 TInternetExplorer.OnNavigateError Event

Pascal

```
property OnNavigateError: TInternetExplorerNavigateError;
```

C++

```
__property TInternetExplorerNavigateError OnNavigateError;
```

Description

This is OnNavigateError, a member of class TInternetExplorer.

8.1.8.6.12 TInternetExplorer.OnNewWindow2 Event

Pascal

```
property OnNewWindow2: TInternetExplorerNewWindow2;
```

C++

```
__property TInternetExplorerNewWindow2 OnNewWindow2;
```

Description

This is OnNewWindow2, a member of class TInternetExplorer.

8.1.8.6.13 TInternetExplorer.OnPrintTemplateInstantiation Event

Pascal

```
property OnPrintTemplateInstantiation: TInternetExplorerPrintTemplateInstantiation;
```

C++

```
__property TInternetExplorerPrintTemplateInstantiation OnPrintTemplateInstantiation;
```

Description

This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.

8.1.8.6.14 TInternetExplorer.OnPrintTemplateTeardown Event

Pascal

```
property OnPrintTemplateTeardown: TInternetExplorerPrintTemplateTeardown;
```

C++

```
__property TInternetExplorerPrintTemplateTeardown OnPrintTemplateTeardown;
```

Description

This is OnPrintTemplateTeardown, a member of class TInternetExplorer.

8.1.8.6.15 TInternetExplorer.OnPrivacyImpactedStateChange Event

Pascal

```
property OnPrivacyImpactedStateChange: TInternetExplorerPrivacyImpactedStateChange;
```

C++

```
__property TInternetExplorerPrivacyImpactedStateChange OnPrivacyImpactedStateChange;
```

Description

This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.

8.1.8.6.16 TInternetExplorer.OnProgressChange Event

Pascal

```
property OnProgressChange: TInternetExplorerProgressChange;
```

C++

```
__property TInternetExplorerProgressChange OnProgressChange;
```

Description

This is OnProgressChange, a member of class TInternetExplorer.

8.1.8.6.17 TInternetExplorer.OnPropertyChange Event

Pascal

```
property OnPropertyChange: TInternetExplorerPropertyChange;
```

C++

```
__property TInternetExplorerPropertyChange OnPropertyChange;
```

Description

This is OnPropertyChange, a member of class TInternetExplorer.

8.1.8.6.18 TInternetExplorer.OnQuit Event

Pascal

```
property OnQuit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnQuit;
```

Description

This is OnQuit, a member of class TInternetExplorer.

8.1.8.6.19 TInternetExplorer.OnSetSecureLockIcon Event

Pascal

```
property OnSetSecureLockIcon: TInternetExplorerSetSecureLockIcon;
```

C++

```
__property TInternetExplorerSetSecureLockIcon OnSetSecureLockIcon;
```

Description

This is OnSetSecureLockIcon, a member of class TInternetExplorer.

8.1.8.6.20 TInternetExplorer.OnStatusBar Event

Pascal

```
property OnStatusBar: TInternetExplorerOnStatusBar;
```

C++

```
__property TInternetExplorerOnStatusBar OnStatusBar;
```

Description

This is OnStatusBar, a member of class TInternetExplorer.

8.1.8.6.21 TInternetExplorer.OnStatusTextChange Event

Pascal

```
property OnStatusTextChange: TInternetExplorerStatusTextChange;
```

C++

```
__property TInternetExplorerStatusTextChange OnStatusTextChange;
```

Description

This is OnStatusTextChange, a member of class TInternetExplorer.

8.1.8.6.22 TInternetExplorer.OnTheaterMode Event

Pascal

```
property OnTheaterMode: TInternetExplorerOnTheaterMode;
```

C++

```
__property TInternetExplorerOnTheaterMode OnTheaterMode;
```

Description

This is OnTheaterMode, a member of class TInternetExplorer.

8.1.8.6.23 TInternetExplorer.OnTitleChange Event

Pascal

```
property OnTitleChange: TInternetExplorerTitleChange;
```

C++

```
__property TInternetExplorerTitleChange OnTitleChange;
```

Description

This is OnTitleChange, a member of class TInternetExplorer.

8.1.8.6.24 TInternetExplorer.OnToolBar Event

Pascal

```
property OnToolBar: TInternetExplorerOnToolBar;
```

C++

```
__property TInternetExplorerOnToolBar OnToolBar;
```

Description

This is OnToolBar, a member of class TInternetExplorer.

8.1.8.6.25 TInternetExplorer.OnUpdatePageStatus Event

Pascal

```
property OnUpdatePageStatus: TInternetExplorerUpdatePageStatus;
```

C++

```
__property TInternetExplorerUpdatePageStatus OnUpdatePageStatus;
```

Description

This is OnUpdatePageStatus, a member of class TInternetExplorer.

8.1.8.6.26 TInternetExplorer.OnVisible Event

Pascal

```
property OnVisible: TInternetExplorerOnVisible;
```

C++

```
__property TInternetExplorerOnVisible OnVisible;
```

Description

This is OnVisible, a member of class TInternetExplorer.

8.1.8.6.27 TInternetExplorer.OnWindowClosing Event

Pascal

```
property OnWindowClosing: TInternetExplorerWindowClosing;
```

C++

```
__property TInternetExplorerWindowClosing OnWindowClosing;
```

Description

This is OnWindowClosing, a member of class TInternetExplorer.

8.1.8.6.28 TInternetExplorer.OnWindowSetHeight Event

Pascal

```
property OnWindowSetHeight: TInternetExplorerWindowSetHeight;
```

C++

```
__property TInternetExplorerWindowSetHeight OnWindowSetHeight;
```

Description

This is OnWindowSetHeight, a member of class TInternetExplorer.

8.1.8.6.29 TInternetExplorer.OnWindowSetLeft Event

Pascal

```
property OnWindowSetLeft: TInternetExplorerWindowSetLeft;
```

C++

```
__property TInternetExplorerWindowSetLeft OnWindowSetLeft;
```

Description

This is OnWindowSetLeft, a member of class TInternetExplorer.

8.1.8.6.30 TInternetExplorer.OnWindowSetResizable Event

Pascal

```
property OnWindowSetResizable: TInternetExplorerWindowSetResizable;
```

C++

```
__property TInternetExplorerWindowSetResizable OnWindowSetResizable;
```

Description

This is OnWindowSetResizable, a member of class TInternetExplorer.

8.1.8.6.31 TInternetExplorer.OnWindowSetTop Event

Pascal

```
property OnWindowSetTop: TInternetExplorerWindowSetTop;
```

C++

```
__property TInternetExplorerWindowSetTop OnWindowSetTop;
```

Description

This is OnWindowSetTop, a member of class TInternetExplorer.

8.1.8.6.32 TInternetExplorer.OnWindowSetWidth Event

Pascal

```
property OnWindowSetWidth: TInternetExplorerWindowSetWidth;
```

C++

```
__property TInternetExplorerWindowSetWidth OnWindowSetWidth;
```

Description

This is OnWindowSetWidth, a member of class TInternetExplorer.

8.1.9 TShellNameSpace Class

Class Hierarchy

Pascal

```
TShellNameSpace = class(TOleServer);
```

C++

```
class TShellNameSpace : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TShellNameSpace.

8.1.9.1 TShellNameSpace Members

The following tables list the members exposed by TShellNameSpace.

Protected Methods

	Name	Description
	Get_Columns (see page 472)	This is Get_Columns, a member of class TShellNameSpace.
	Get_CountViewTypes (see page 472)	This is Get_CountViewTypes, a member of class TShellNameSpace.
	Get_Depth (see page 472)	This is Get_Depth, a member of class TShellNameSpace.
	Get_EnumOptions (see page 473)	This is Get_EnumOptions, a member of class TShellNameSpace.
	Get_Flags (see page 473)	This is Get_Flags, a member of class TShellNameSpace.
	Get_Mode (see page 473)	This is Get_Mode, a member of class TShellNameSpace.
	Get_Root (see page 473)	This is Get_Root, a member of class TShellNameSpace.
	Get_SelectedItem (see page 474)	This is Get_SelectedItem, a member of class TShellNameSpace.
	Get_SubscriptionsEnabled (see page 474)	This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.
	Get_TVFlags (see page 474)	This is Get_TVFlags, a member of class TShellNameSpace.
	InitServerData (see page 474)	Initializes the ServerData property to reflect the type library information of the COM server.
	InvokeEvent (see page 475)	Dispatches an event from the COM server to the appropriate event handler.
	Set_Columns (see page 477)	This is Set_Columns, a member of class TShellNameSpace.
	Set_Depth (see page 477)	This is Set_Depth, a member of class TShellNameSpace.
	Set_EnumOptions (see page 477)	This is Set_EnumOptions, a member of class TShellNameSpace.
	Set_Flags (see page 477)	This is Set_Flags, a member of class TShellNameSpace.
	Set_Mode (see page 478)	This is Set_Mode, a member of class TShellNameSpace.
	Set_Root (see page 478)	This is Set_Root, a member of class TShellNameSpace.
	Set_SelectedItem (see page 478)	This is Set_SelectedItem, a member of class TShellNameSpace.
	Set_TVFlags (see page 478)	This is Set_TVFlags, a member of class TShellNameSpace.

Public Methods

	Name	Description
V	Connect (see page 470)	Establishes a connection to the COM server.
	ConnectTo (see page 470)	This is ConnectTo, a member of class TShellNameSpace.
V	Create (see page 467)	Allocates memory and constructs a safely initialized instance of a component.
	CreateSubscriptionForSelection (see page 471)	This is CreateSubscriptionForSelection, a member of class TShellNameSpace.
	DeleteSubscriptionForSelection (see page 471)	This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.
V	Destroy (see page 468)	Disposes of the component and its owned components.
V	Disconnect (see page 471)	Terminates the connection to the COM server.
	Expand (see page 472)	This is Expand, a member of class TShellNameSpace.
	Export (see page 472)	This is Export, a member of class TShellNameSpace.
	Import (see page 474)	This is Import, a member of class TShellNameSpace.
	InvokeContextMenuCommand (see page 475)	This is InvokeContextMenuCommand, a member of class TShellNameSpace.
	MoveSelectionDown (see page 475)	This is MoveSelectionDown, a member of class TShellNameSpace.
	MoveSelectionTo (see page 476)	This is MoveSelectionTo, a member of class TShellNameSpace.
	MoveSelectionUp (see page 476)	This is MoveSelectionUp, a member of class TShellNameSpace.
	NewFolder (see page 476)	This is NewFolder, a member of class TShellNameSpace.
	ResetSort (see page 476)	This is ResetSort, a member of class TShellNameSpace.
	SelectedItems (see page 477)	This is SelectedItems, a member of class TShellNameSpace.
	SetRoot (see page 479)	This is SetRoot, a member of class TShellNameSpace.
	SetViewType (see page 479)	This is SetViewType, a member of class TShellNameSpace.
	Synchronize (see page 479)	This is Synchronize, a member of class TShellNameSpace.
	UnselectAll (see page 479)	This is UnselectAll, a member of class TShellNameSpace.

Public Properties

	Name	Description
	Columns (see page 480)	This is Columns, a member of class TShellNameSpace.
R	CountViewTypes (see page 480)	This is CountViewTypes, a member of class TShellNameSpace.
R	DefaultInterface (see page 480)	This is DefaultInterface, a member of class TShellNameSpace.
	Depth (see page 480)	This is Depth, a member of class TShellNameSpace.
	EnumOptions (see page 481)	This is EnumOptions, a member of class TShellNameSpace.
	Flags (see page 481)	This is Flags, a member of class TShellNameSpace.
	Mode (see page 481)	This is Mode, a member of class TShellNameSpace.
	Root (see page 481)	This is Root, a member of class TShellNameSpace.
	SelectedItem (see page 482)	This is SelectedItem, a member of class TShellNameSpace.
R	SubscriptionsEnabled (see page 482)	This is SubscriptionsEnabled, a member of class TShellNameSpace.
	TVFlags (see page 482)	This is TVFlags, a member of class TShellNameSpace.

Published Events

	Name	Description
	OnDoubleClick (see page 482)	This is OnDoubleClick, a member of class TShellNameSpace.
	OnFavoritesSelectionChange (see page 483)	This is OnFavoritesSelectionChange, a member of class TShellNameSpace.
	OnInitialized (see page 483)	This is OnInitialized, a member of class TShellNameSpace.
	OnSelectionChange (see page 483)	This is OnSelectionChange, a member of class TShellNameSpace.

8.1.9.2 TShellNameSpace.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellNameSpace(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Destroy

System::TObject::Free (see page 3372)

Owner

8.1.9.3 TShellNameSpace.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellNameSpace();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

8.1.9.4 TShellNameSpace Methods

The methods of the TShellNameSpace class are listed here.

Protected Methods

	Name	Description
	Get_Columns (see page 472)	This is Get_Columns, a member of class TShellNameSpace.
	Get_CountViewTypes (see page 472)	This is Get_CountViewTypes, a member of class TShellNameSpace.
	Get_Depth (see page 472)	This is Get_Depth, a member of class TShellNameSpace.
	Get_EnumOptions (see page 473)	This is Get_EnumOptions, a member of class TShellNameSpace.
	Get_Flags (see page 473)	This is Get_Flags, a member of class TShellNameSpace.
	Get_Mode (see page 473)	This is Get_Mode, a member of class TShellNameSpace.
	Get_Root (see page 473)	This is Get_Root, a member of class TShellNameSpace.
	Get_SelectedItem (see page 474)	This is Get_SelectedItem, a member of class TShellNameSpace.
	Get_SubscriptionsEnabled (see page 474)	This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.
	Get_TVFlags (see page 474)	This is Get_TVFlags, a member of class TShellNameSpace.
	InitServerData (see page 474)	Initializes the ServerData property to reflect the type library information of the COM server.
	InvokeEvent (see page 475)	Dispatches an event from the COM server to the appropriate event handler.
	Set_Columns (see page 477)	This is Set_Columns, a member of class TShellNameSpace.
	Set_Depth (see page 477)	This is Set_Depth, a member of class TShellNameSpace.
	Set_EnumOptions (see page 477)	This is Set_EnumOptions, a member of class TShellNameSpace.
	Set_Flags (see page 477)	This is Set_Flags, a member of class TShellNameSpace.
	Set_Mode (see page 478)	This is Set_Mode, a member of class TShellNameSpace.
	Set_Root (see page 478)	This is Set_Root, a member of class TShellNameSpace.
	Set_SelectedItem (see page 478)	This is Set_SelectedItem, a member of class TShellNameSpace.
	Set_TVFlags (see page 478)	This is Set_TVFlags, a member of class TShellNameSpace.

Public Methods

	Name	Description
	Connect (see page 470)	Establishes a connection to the COM server.
	ConnectTo (see page 470)	This is ConnectTo, a member of class TShellNameSpace.
	CreateSubscriptionForSelection (see page 471)	This is CreateSubscriptionForSelection, a member of class TShellNameSpace.

	DeleteSubscriptionForSelection (see page 471)	This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.
	Disconnect (see page 471)	Terminates the connection to the COM server.
	Expand (see page 472)	This is Expand, a member of class TShellNameSpace.
	Export (see page 472)	This is Export, a member of class TShellNameSpace.
	Import (see page 474)	This is Import, a member of class TShellNameSpace.
	InvokeContextMenuCommand (see page 475)	This is InvokeContextMenuCommand, a member of class TShellNameSpace.
	MoveSelectionDown (see page 475)	This is MoveSelectionDown, a member of class TShellNameSpace.
	MoveSelectionTo (see page 476)	This is MoveSelectionTo, a member of class TShellNameSpace.
	MoveSelectionUp (see page 476)	This is MoveSelectionUp, a member of class TShellNameSpace.
	NewFolder (see page 476)	This is NewFolder, a member of class TShellNameSpace.
	ResetSort (see page 476)	This is ResetSort, a member of class TShellNameSpace.
	SelectedItems (see page 477)	This is SelectedItems, a member of class TShellNameSpace.
	SetRoot (see page 479)	This is SetRoot, a member of class TShellNameSpace.
	SetViewType (see page 479)	This is SetViewType, a member of class TShellNameSpace.
	Synchronize (see page 479)	This is Synchronize, a member of class TShellNameSpace.
	UnselectAll (see page 479)	This is UnselectAll, a member of class TShellNameSpace.

8.1.9.4.1 TShellNameSpace.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

AutoConnect

ConnectKind

RemoteMachineName

Disconnect

Using Component Wrappers

8.1.9.4.2 TShellNameSpace.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellNameSpace);
```

C++

```
__fastcall ConnectTo(IShellNameSpace svrIntf);
```

Description

This is ConnectTo, a member of class TShellNameSpace.

8.1.9.4.3 TShellNameSpace.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class TShellNameSpace.

8.1.9.4.4 TShellNameSpace.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.

8.1.9.4.5 TShellNameSpace.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect

Using Component Wrappers

8.1.9.4.6 TShellNameSpace.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT);
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class TShellNameSpace.

8.1.9.4.7 TShellNameSpace.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class TShellNameSpace.

8.1.9.4.8 TShellNameSpace.Get_Columns Method

Pascal

```
function Get_Columns: WideString;
```

C++

```
__fastcall BSTR Get_Columns();
```

Description

This is Get_Columns, a member of class TShellNameSpace.

8.1.9.4.9 TShellNameSpace.Get_CountViewTypes Method

Pascal

```
function Get_CountViewTypes: SYSINT;
```

C++

```
__fastcall SYSINT Get_CountViewTypes();
```

Description

This is Get_CountViewTypes, a member of class TShellNameSpace.

8.1.9.4.10 TShellNameSpace.Get_Depth Method

Pascal

```
function Get_Depth: SYSINT;
```

C++

```
__fastcall SYSINT Get_Depth();
```

Description

This is Get_Depth, a member of class TShellNameSpace.

8.1.9.4.11 TShellNameSpace.Get_EnumOptions Method

Pascal

```
function Get_EnumOptions: Integer;
```

C++

```
__fastcall int Get_EnumOptions();
```

Description

This is Get_EnumOptions, a member of class TShellNameSpace.

8.1.9.4.12 TShellNameSpace.Get_Flags Method

Pascal

```
function Get_Flags: LongWord;
```

C++

```
__fastcall LongWord Get_Flags();
```

Description

This is Get_Flags, a member of class TShellNameSpace.

8.1.9.4.13 TShellNameSpace.Get_Mode Method

Pascal

```
function Get_Mode: SYSUINT;
```

C++

```
__fastcall SYSUINT Get_Mode();
```

Description

This is Get_Mode, a member of class TShellNameSpace.

8.1.9.4.14 TShellNameSpace.Get_Root Method

Pascal

```
function Get_Root: OleVariant;
```

C++

```
__fastcall OleVariant Get_Root();
```

Description

This is Get_Root, a member of class TShellNameSpace.

8.1.9.4.15 TShellNameSpace.Get_SelectedItem Method

Pascal

```
function Get_SelectedItem: IDispatch;
```

C++

```
__fastcall IDispatch Get_SelectedItem();
```

Description

This is Get_SelectedItem, a member of class TShellNameSpace.

8.1.9.4.16 TShellNameSpace.Get_SubscriptionsEnabled Method

Pascal

```
function Get_SubscriptionsEnabled: WordBool;
```

C++

```
__fastcall WordBool Get_SubscriptionsEnabled();
```

Description

This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.

8.1.9.4.17 TShellNameSpace.Get_TVFlags Method

Pascal

```
function Get_TVFlags: LongWord;
```

C++

```
__fastcall LongWord Get_TVFlags();
```

Description

This is Get_TVFlags, a member of class TShellNameSpace.

8.1.9.4.18 TShellNameSpace.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class TShellNameSpace.

8.1.9.4.19 TShellNameSpace.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

ServerData

Create

8.1.9.4.20 TShellNameSpace.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class TShellNameSpace.

8.1.9.4.21 TShellNameSpace.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the appropriate event handlers.

See Also

EventDispatch

8.1.9.4.22 TShellNameSpace.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class TShellNameSpace.

8.1.9.4.23 TShellNameSpace.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class TShellNameSpace.

8.1.9.4.24 TShellNameSpace.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class TShellNameSpace.

8.1.9.4.25 TShellNameSpace.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class TShellNameSpace.

8.1.9.4.26 TShellNameSpace.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class TShellNameSpace.

8.1.9.4.27 TShellNameSpace.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class TShellNameSpace.

8.1.9.4.28 TShellNameSpace.Set_Columns Method

Pascal

```
procedure Set_Columns(const bstrColumns: WideString);
```

C++

```
__fastcall Set_Columns(const BSTR bstrColumns);
```

Description

This is Set_Columns, a member of class TShellNameSpace.

8.1.9.4.29 TShellNameSpace.Set_Depth Method

Pascal

```
procedure Set_Depth(piDepth: SYSINT);
```

C++

```
__fastcall Set_Depth(SYSINT piDepth);
```

Description

This is Set_Depth, a member of class TShellNameSpace.

8.1.9.4.30 TShellNameSpace.Set_EnumOptions Method

Pascal

```
procedure Set_EnumOptions(pgrfEnumFlags: Integer);
```

C++

```
__fastcall Set_EnumOptions(int pgrfEnumFlags);
```

Description

This is Set_EnumOptions, a member of class TShellNameSpace.

8.1.9.4.31 TShellNameSpace.Set_Flags Method

Pascal

```
procedure Set_Flags(pdwFlags: LongWord);
```

C++

```
__fastcall Set_Flags(LongWord pdwFlags);
```

Description

This is Set_Flags, a member of class TShellNameSpace.

8.1.9.4.32 TShellNameSpace.Set_Mode Method

Pascal

```
procedure Set_Mode(puMode: SYSUINT);
```

C++

```
__fastcall Set_Mode(SYSUINT puMode);
```

Description

This is Set_Mode, a member of class TShellNameSpace.

8.1.9.4.33 TShellNameSpace.Set_Root Method

Pascal

```
procedure Set_Root(pvar: OleVariant);
```

C++

```
__fastcall Set_Root(OleVariant pvar);
```

Description

This is Set_Root, a member of class TShellNameSpace.

8.1.9.4.34 TShellNameSpace.Set_SelectedItem Method

Pascal

```
procedure Set_SelectedItem(const pItem: IDispatch);
```

C++

```
__fastcall Set_SelectedItem(const IDispatch pItem);
```

Description

This is Set_SelectedItem, a member of class TShellNameSpace.

8.1.9.4.35 TShellNameSpace.Set_TVFlags Method

Pascal

```
procedure Set_TVFlags(dwFlags: LongWord);
```

C++

```
__fastcall Set_TVFlags(LongWord dwFlags);
```

Description

This is Set_TVFlags, a member of class TShellNameSpace.

8.1.9.4.36 TShellNameSpace.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class TShellNameSpace.

8.1.9.4.37 TShellNameSpace.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT);
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class TShellNameSpace.

8.1.9.4.38 TShellNameSpace.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class TShellNameSpace.

8.1.9.4.39 TShellNameSpace.UnselectAll Method

Pascal

```
procedure UnselectAll;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class TShellNameSpace.

8.1.9.5 TShellNameSpace Properties

The properties of the TShellNameSpace class are listed here.

Public Properties

	Name	Description
	Columns (see page 480)	This is Columns, a member of class TShellNameSpace.
R	CountViewTypes (see page 480)	This is CountViewTypes, a member of class TShellNameSpace.
R	DefaultInterface (see page 480)	This is DefaultInterface, a member of class TShellNameSpace.
	Depth (see page 480)	This is Depth, a member of class TShellNameSpace.
	EnumOptions (see page 481)	This is EnumOptions, a member of class TShellNameSpace.
	Flags (see page 481)	This is Flags, a member of class TShellNameSpace.
	Mode (see page 481)	This is Mode, a member of class TShellNameSpace.
	Root (see page 481)	This is Root, a member of class TShellNameSpace.
	SelectedItem (see page 482)	This is SelectedItem, a member of class TShellNameSpace.
R	SubscriptionsEnabled (see page 482)	This is SubscriptionsEnabled, a member of class TShellNameSpace.
	TVFlags (see page 482)	This is TVFlags, a member of class TShellNameSpace.

8.1.9.5.1 TShellNameSpace.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class TShellNameSpace.

8.1.9.5.2 TShellNameSpace.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class TShellNameSpace.

8.1.9.5.3 TShellNameSpace.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellNameSpace;
```

C++

```
__property IShellNameSpace DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellNameSpace.

8.1.9.5.4 TShellNameSpace.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class TShellNameSpace.

8.1.9.5.5 TShellNameSpace.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class TShellNameSpace.

8.1.9.5.6 TShellNameSpace.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class TShellNameSpace.

8.1.9.5.7 TShellNameSpace.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class TShellNameSpace.

8.1.9.5.8 TShellNameSpace.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class TShellNameSpace.

8.1.9.5.9 TShellNameSpace.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class TShellNameSpace.

8.1.9.5.10 TShellNameSpace.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class TShellNameSpace.

8.1.9.5.11 TShellNameSpace.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class TShellNameSpace.

8.1.9.6 TShellNameSpace Events

The events of the TShellNameSpace class are listed here.

Published Events

	Name	Description
	OnDoubleClick (see page 482)	This is OnDoubleClick, a member of class TShellNameSpace.
	OnFavoritesSelectionChange (see page 483)	This is OnFavoritesSelectionChange, a member of class TShellNameSpace.
	OnInitialized (see page 483)	This is OnInitialized, a member of class TShellNameSpace.
	OnSelectionChange (see page 483)	This is OnSelectionChange, a member of class TShellNameSpace.

8.1.9.6.1 TShellNameSpace.OnDoubleClick Event

Pascal

```
property OnDoubleClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDoubleClick;
```

Description

This is OnDoubleClick, a member of class TShellNameSpace.

8.1.9.6.2 TShellNameSpace.OnFavoritesSelectionChange Event

Pascal

```
property OnFavoritesSelectionChange: TShellNameSpaceFavoritesSelectionChange;
```

C++

```
__property TShellNameSpaceFavoritesSelectionChange OnFavoritesSelectionChange;
```

Description

This is OnFavoritesSelectionChange, a member of class TShellNameSpace.

8.1.9.6.3 TShellNameSpace.OnInitialized Event

Pascal

```
property OnInitialized: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnInitialized;
```

Description

This is OnInitialized, a member of class TShellNameSpace.

8.1.9.6.4 TShellNameSpace.OnSelectionChange Event

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

This is OnSelectionChange, a member of class TShellNameSpace.

8.1.10 TShellUIHelper Class

Class Hierarchy

Pascal

```
TShellUIHelper = class(TOleServer);
```

C++

```
class TShellUIHelper : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TShellUIHelper.

8.1.10.1 TShellUIHelper Members

The following tables list the members exposed by TShellUIHelper.

Protected Methods

	Name	Description
	InitServerData (see page 492)	Initializes the ServerData property to reflect the type library information of the COM server.

Public Methods

	Name	Description
	AddChannel (see page 486)	This is AddChannel, a member of class TShellUIHelper.
	AddDesktopComponent (see page 487)	This is the overview for the AddDesktopComponent method overload.
	AddFavorite (see page 488)	This is the overview for the AddFavorite method overload.
	AutoCompleteAttach (see page 489)	This is the overview for the AutoCompleteAttach method overload.
	AutoCompleteSaveForm (see page 490)	This is the overview for the AutoCompleteSaveForm method overload.
	AutoScan (see page 490)	This is the overview for the AutoScan method overload.
	Connect (see page 491)	Establishes a connection to the COM server.
	ConnectTo (see page 491)	This is ConnectTo, a member of class TShellUIHelper.
	Create (see page 484)	Allocates memory and constructs a safely initialized instance of a component.
	Destroy (see page 485)	Disposes of the component and its owned components.
	Disconnect (see page 492)	Terminates the connection to the COM server.
	ImportExportFavorites (see page 492)	This is ImportExportFavorites, a member of class TShellUIHelper.
	IsSubscribed (see page 493)	This is IsSubscribed, a member of class TShellUIHelper.
	NavigateAndFind (see page 493)	This is NavigateAndFind, a member of class TShellUIHelper.
	RefreshOfflineDesktop (see page 493)	This is RefreshOfflineDesktop, a member of class TShellUIHelper.
	ResetFirstBootMode (see page 493)	This is ResetFirstBootMode, a member of class TShellUIHelper.
	ResetSafeMode (see page 494)	This is ResetSafeMode, a member of class TShellUIHelper.
	ShowBrowserUI (see page 494)	This is ShowBrowserUI, a member of class TShellUIHelper.

Public Properties

	Name	Description
	DefaultInterface (see page 494)	This is DefaultInterface, a member of class TShellUIHelper.

8.1.10.2 TShellUIHelper.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellUIHelper(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Destroy

System::TObject::Free (see page 3372)

Owner

8.1.10.3 TShellUIHelper.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellUIHelper();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

8.1.10.4 TShellUIHelper Methods

The methods of the TShellUIHelper class are listed here.

Protected Methods

	Name	Description
	InitServerData (see page 492)	Initializes the ServerData property to reflect the type library information of the COM server.

Public Methods

	Name	Description
	AddChannel (see page 486)	This is AddChannel, a member of class TShellUIHelper.
	AddDesktopComponent (see page 487)	This is the overview for the AddDesktopComponent method overload.
	AddFavorite (see page 488)	This is the overview for the AddFavorite method overload.
	AutoCompleteAttach (see page 489)	This is the overview for the AutoCompleteAttach method overload.
	AutoCompleteSaveForm (see page 490)	This is the overview for the AutoCompleteSaveForm method overload.
	AutoScan (see page 490)	This is the overview for the AutoScan method overload.
	Connect (see page 491)	Establishes a connection to the COM server.
	ConnectTo (see page 491)	This is ConnectTo, a member of class TShellUIHelper.
	Disconnect (see page 492)	Terminates the connection to the COM server.
	ImportExportFavorites (see page 492)	This is ImportExportFavorites, a member of class TShellUIHelper.
	IsSubscribed (see page 493)	This is IsSubscribed, a member of class TShellUIHelper.
	NavigateAndFind (see page 493)	This is NavigateAndFind, a member of class TShellUIHelper.
	RefreshOfflineDesktop (see page 493)	This is RefreshOfflineDesktop, a member of class TShellUIHelper.
	ResetFirstBootMode (see page 493)	This is ResetFirstBootMode, a member of class TShellUIHelper.
	ResetSafeMode (see page 494)	This is ResetSafeMode, a member of class TShellUIHelper.
	ShowBrowserUI (see page 494)	This is ShowBrowserUI, a member of class TShellUIHelper.

8.1.10.4.1 TShellUIHelper.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString);
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class TShellUIHelper.

8.1.10.4.2 AddDesktopComponent Method

This is the overview for the AddDesktopComponent method overload.

Overload List

	Name	Description
	TShellUIHelper.AddDesktopComponent (WideString, WideString) (see page 487)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant) (see page 487)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant) (see page 487)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant, OleVariant) (see page 488)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 488)	This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.2.1 TShellUIHelper.AddDesktopComponent Method (WideString, WideString)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.2.2 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.2.3 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.2.4 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.2.5 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

8.1.10.4.3 AddFavorite Method

This is the overview for the AddFavorite method overload.

Overload List

	Name	Description
	TShellUIHelper.AddFavorite (WideString) (see page 488)	This is AddFavorite, a member of class TShellUIHelper.
	TShellUIHelper.AddFavorite (WideString, OleVariant) (see page 489)	This is AddFavorite, a member of class TShellUIHelper.

8.1.10.4.3.1 TShellUIHelper.AddFavorite Method (WideString)

Pascal

```
procedure AddFavorite(const URL: WideString); overload;
```

C++

```
__fastcall AddFavorite(const BSTR URL);
```

Description

This is AddFavorite, a member of class TShellUIHelper.

8.1.10.4.3.2 TShellUIHelper.AddFavorite Method (WideString, OleVariant)

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant); overload;
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class TShellUIHelper.

8.1.10.4.4 AutoCompleteAttach Method

This is the overview for the AutoCompleteAttach method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoCompleteAttach () (see page 489)	This is AutoCompleteAttach, a member of class TShellUIHelper.
	TShellUIHelper.AutoCompleteAttach (OleVariant) (see page 489)	This is AutoCompleteAttach, a member of class TShellUIHelper.

8.1.10.4.4.1 TShellUIHelper.AutoCompleteAttach Method ()

Pascal

```
procedure AutoCompleteAttach; overload;
```

C++

```
__fastcall AutoCompleteAttach();
```

Description

This is AutoCompleteAttach, a member of class TShellUIHelper.

8.1.10.4.4.2 TShellUIHelper.AutoCompleteAttach Method (OleVariant)

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant); overload;
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class TShellUIHelper.

8.1.10.4.5 AutoCompleteSaveForm Method

This is the overview for the AutoCompleteSaveForm method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoCompleteSaveForm () (see page 490)	This is AutoCompleteSaveForm, a member of class TShellUIHelper.
	TShellUIHelper.AutoCompleteSaveForm (OleVariant) (see page 490)	This is AutoCompleteSaveForm, a member of class TShellUIHelper.

8.1.10.4.5.1 TShellUIHelper.AutoCompleteSaveForm Method ()

Pascal

```
procedure AutoCompleteSaveForm; overload;
```

C++

```
__fastcall AutoCompleteSaveForm();
```

Description

This is AutoCompleteSaveForm, a member of class TShellUIHelper.

8.1.10.4.5.2 TShellUIHelper.AutoCompleteSaveForm Method (OleVariant)

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant); overload;
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class TShellUIHelper.

8.1.10.4.6 AutoScan Method

This is the overview for the AutoScan method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoScan (WideString, WideString) (see page 490)	This is AutoScan, a member of class TShellUIHelper.
	TShellUIHelper.AutoScan (WideString, WideString, OleVariant) (see page 491)	This is AutoScan, a member of class TShellUIHelper.

8.1.10.4.6.1 TShellUIHelper.AutoScan Method (WideString, WideString)

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString); overload;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl);
```

Description

This is AutoScan, a member of class TShellUIHelper.

8.1.10.4.6.2 TShellUIHelper.AutoScan Method (WideString, WideString, OleVariant)

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant); overload;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class TShellUIHelper.

8.1.10.4.7 TShellUIHelper.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

AutoConnect

ConnectKind

RemoteMachineName

Disconnect

Using Component Wrappers

8.1.10.4.8 TShellUIHelper.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellUIHelper);
```

C++

```
__fastcall ConnectTo(IShellUIHelper svrIntf);
```

Description

This is ConnectTo, a member of class TShellUIHelper.

8.1.10.4.9 TShellUIHelper.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect

Using Component Wrappers

8.1.10.4.10 TShellUIHelper.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString);
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class TShellUIHelper.

8.1.10.4.11 TShellUIHelper.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

Create

8.1.10.4.12 TShellUIHelper.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class TShellUIHelper.

8.1.10.4.13 TShellUIHelper.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant);
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class TShellUIHelper.

8.1.10.4.14 TShellUIHelper.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class TShellUIHelper.

8.1.10.4.15 TShellUIHelper.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class TShellUIHelper.

8.1.10.4.16 TShellUIHelper.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class TShellUIHelper.

8.1.10.4.17 TShellUIHelper.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class TShellUIHelper.

8.1.10.5 TShellUIHelper Properties

The properties of the TShellUIHelper class are listed here.

Public Properties

	Name	Description
	DefaultInterface (see page 494)	This is DefaultInterface, a member of class TShellUIHelper.

8.1.10.5.1 TShellUIHelper.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellUIHelper;
```

C++

```
__property IShellUIHelper DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellUIHelper.

8.1.11 TShellWindows Class

SHDocVw

Description

This is class SHDocVw.TShellWindows.

8.1.11.1 TShellWindows Members

The following tables list the members exposed by TShellWindows.

Protected Methods

	Name	Description
	Get_Count (see page 499)	This is Get_Count, a member of class TShellWindows.
V	InitServerData (see page 499)	Initializes the ServerData property to reflect the type library information of the COM server.
V	InvokeEvent (see page 500)	Dispatches an event from the COM server to the appropriate event handler.

Public Methods

	Name	Description
	_NewEnum (see page 498)	This is _NewEnum, a member of class TShellWindows.
V	Connect (see page 498)	Establishes a connection to the COM server.
	ConnectTo (see page 498)	This is ConnectTo, a member of class TShellWindows.
V	Create (see page 495)	Allocates memory and constructs a safely initialized instance of a component.
V	Destroy (see page 496)	Disposes of the component and its owned components.
V	Disconnect (see page 499)	Terminates the connection to the COM server.
	FindWindowSW (see page 499)	This is FindWindowSW, a member of class TShellWindows.
	Item (see page 500)	This is the overview for the Item method overload.
	OnActivated (see page 501)	This is OnActivated, a member of class TShellWindows.
	OnCreated (see page 501)	This is OnCreated, a member of class TShellWindows.
	OnNavigate (see page 501)	This is OnNavigate, a member of class TShellWindows.
	ProcessAttachDetach (see page 502)	This is ProcessAttachDetach, a member of class TShellWindows.
	Register (see page 502)	This is Register, a member of class TShellWindows.
	RegisterPending (see page 502)	This is RegisterPending, a member of class TShellWindows.
	Revoke (see page 502)	This is Revoke, a member of class TShellWindows.

Public Properties

	Name	Description
R	Count (see page 503)	This is Count, a member of class TShellWindows.
R	DefaultInterface (see page 503)	This is DefaultInterface, a member of class TShellWindows.

Published Events

	Name	Description
	OnWindowRegistered (see page 503)	This is OnWindowRegistered, a member of class TShellWindows.
	OnWindowRevoked (see page 504)	This is OnWindowRevoked, a member of class TShellWindows.

8.1.11.2 TShellWindows.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellWindows(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

8.1.11.3 TShellWindows.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellWindows();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

8.1.11.4 TShellWindows Methods

The methods of the TShellWindows class are listed here.

Protected Methods

	Name	Description
	Get_Count (see page 499)	This is Get_Count, a member of class TShellWindows.
	InitServerData (see page 499)	Initializes the ServerData property to reflect the type library information of the COM server.
	InvokeEvent (see page 500)	Dispatches an event from the COM server to the appropriate event handler.

Public Methods

	Name	Description
	_NewEnum (see page 498)	This is _NewEnum, a member of class TShellWindows.
	Connect (see page 498)	Establishes a connection to the COM server.
	ConnectTo (see page 498)	This is ConnectTo, a member of class TShellWindows.
	Disconnect (see page 499)	Terminates the connection to the COM server.
	FindWindowSW (see page 499)	This is FindWindowSW, a member of class TShellWindows.
	Item (see page 500)	This is the overview for the Item method overload.
	OnActivated (see page 501)	This is OnActivated, a member of class TShellWindows.
	OnCreated (see page 501)	This is OnCreated, a member of class TShellWindows.
	OnNavigate (see page 501)	This is OnNavigate, a member of class TShellWindows.
	ProcessAttachDetach (see page 502)	This is ProcessAttachDetach, a member of class TShellWindows.
	Register (see page 502)	This is Register, a member of class TShellWindows.
	RegisterPending (see page 502)	This is RegisterPending, a member of class TShellWindows.
	Revoke (see page 502)	This is Revoke, a member of class TShellWindows.

8.1.11.4.1 TShellWindows._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class TShellWindows.

8.1.11.4.2 TShellWindows.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

8.1.11.4.3 TShellWindows.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellWindows);
```

C++

```
__fastcall ConnectTo(IShellWindows svrIntf);
```

Description

This is ConnectTo, a member of class TShellWindows.

8.1.11.4.4 TShellWindows.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

Using Component Wrappers

8.1.11.4.5 TShellWindows.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class TShellWindows.

8.1.11.4.6 TShellWindows.Get_Count Method

Pascal

```
function Get_Count: Integer;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class TShellWindows.

8.1.11.4.7 TShellWindows.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

ServerData

Create

8.1.11.4.8 TShellWindows.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the appropriate event handlers.

EventDispatch

8.1.11.4.9 Item Method

This is the overview for the Item method overload.

Overload List

	Name	Description
	TShellWindows.Item () (see page 500)	This is Item, a member of class TShellWindows.
	TShellWindows.Item (OleVariant) (see page 501)	This is Item, a member of class TShellWindows.

8.1.11.4.9.1 TShellWindows.Item Method ()

Pascal

```
function Item: IDispatch; overload;
```

C++

```
__fastcall IDispatch Item();
```

Description

This is Item, a member of class TShellWindows.

8.1.11.4.9.2 TShellWindows.Item Method (OleVariant)

Pascal

```
function Item(index: OleVariant): IDispatch; overload;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class TShellWindows.

8.1.11.4.10 TShellWindows.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool);
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class TShellWindows.

8.1.11.4.11 TShellWindows.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown);
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class TShellWindows.

8.1.11.4.12 TShellWindows.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant);
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class TShellWindows.

8.1.11.4.13 TShellWindows.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool);
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class TShellWindows.

8.1.11.4.14 TShellWindows.Register Method

Pascal

```
procedure Register(const pid: IDispatch; HWND: Integer; swClass: SYSINT; out plCookie:
Integer);
```

C++

```
__fastcall Register(const IDispatch pid, int HWND, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class TShellWindows.

8.1.11.4.15 TShellWindows.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer);
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class TShellWindows.

8.1.11.4.16 TShellWindows.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer);
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class TShellWindows.

8.1.11.5 TShellWindows Properties

The properties of the TShellWindows class are listed here.

Public Properties

	Name	Description
	Count (see page 503)	This is Count, a member of class TShellWindows.
	DefaultInterface (see page 503)	This is DefaultInterface, a member of class TShellWindows.

8.1.11.5.1 TShellWindows.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TShellWindows.

8.1.11.5.2 TShellWindows.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellWindows;
```

C++

```
__property IShellWindows DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellWindows.

8.1.11.6 TShellWindows Events

The events of the TShellWindows class are listed here.

Published Events

	Name	Description
	OnWindowRegistered (see page 503)	This is OnWindowRegistered, a member of class TShellWindows.
	OnWindowRevoked (see page 504)	This is OnWindowRevoked, a member of class TShellWindows.

8.1.11.6.1 TShellWindows.OnWindowRegistered Event

Pascal

```
property OnWindowRegistered: TShellWindowsWindowRegistered;
```

C++

```
__property TShellWindowsWindowRegistered OnWindowRegistered;
```

Description

This is OnWindowRegistered, a member of class TShellWindows.

8.1.11.6.2 TShellWindows.OnWindowRevoked Event

Pascal

```
property OnWindowRevoked: TShellWindowsWindowRevoked;
```

C++

```
__property TShellWindowsWindowRevoked OnWindowRevoked;
```

Description

This is OnWindowRevoked, a member of class TShellWindows.

8.1.12 TWebBrowser Class

TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).

Class Hierarchy

Pascal

```
TWebBrowser = class(TOleControl);
```

C++

```
class TWebBrowser : public TOleControl;
```

File

SHDocVw

Description

TWebBrowser wraps the IWebBrowser2 (see page 749) interface from Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL) to allow you to create a customized Web browsing application or to add Internet, file and network browsing, document viewing, and data downloading capabilities to your applications.

Note: Because TWebBrowser wraps the SHDOCVW.DLL, you must have SHDOCVW.DLL installed to use this component. This DLL ships with Internet Explorer 4 and later.

8.1.12.1 TWebBrowser Members

The following tables list the members exposed by TWebBrowser.

Protected Methods

	Name	Description
	CreateControl (see page 508)	This is CreateControl, a member of class TWebBrowser.
	Get_Application (see page 509)	This is Get_Application, a member of class TWebBrowser.
	Get_Container (see page 509)	This is Get_Container, a member of class TWebBrowser.
	Get_Document (see page 509)	This is Get_Document, a member of class TWebBrowser.
	Get_Parent (see page 509)	This is Get_Parent, a member of class TWebBrowser.
	InitControlData (see page 512)	This is InitControlData, a member of class TWebBrowser.

Public Methods

	Name	Description
	ClientToWindow (see page 507)	Not used in TWebBrowser (see page 504).
	ExecWB (see page 508)	This is the overview for the ExecWB method overload.
	GetProperty (see page 510)	Not used in TWebBrowser (see page 504).
	GoBack (see page 510)	Navigates to the previous item in the history list.
	GoForward (see page 510)	Navigates to the next item in the history list.
	GoHome (see page 511)	Navigates to the current start page.
	GoSearch (see page 511)	Navigates to the current search page.
	Navigate (see page 512)	This is the overview for the Navigate method overload.
	Navigate2 (see page 514)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 515)	Not used in TWebBrowser (see page 504).
	QueryStatusWB (see page 516)	Returns information about what commands the Web browser supports.
	Quit (see page 516)	Not used in TWebBrowser (see page 504).
	Refresh (see page 516)	Reloads the current document.
	Refresh2 (see page 517)	This is the overview for the Refresh2 method overload.
	ShowBrowserBar (see page 518)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 518)	Stops the current operation.

Public Properties

	Name	Description
R	Application (see page 524)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, the interface for the WebBrowser (see page 837) control.
R	Busy (see page 524)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
R	Container (see page 525)	Provides access to the automation interface of the Web browser's container.
R	ControlInterface (see page 525)	Provides access to the interface for this Web browser component.
R	DefaultInterface (see page 526)	Provides access to the default interface for the component.
R	Document (see page 526)	Provides access to the Automation interface of the active document.
R	FullName (see page 528)	Indicates the fully qualified path name for the executable that hosts the Web Browser component.
R	HWnd (see page 529)	Provides access to the Window handle for the Web browser.
R	LocationName (see page 529)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 530)	Identifies the URL or path of the document or folder currently displayed.
R	Name (see page 531)	Indicates the name for the executable that hosts the Web Browser component.
R	Parent (see page 531)	Provides access to the Automation interface of the Web browser's container.
R	Path (see page 532)	Indicates the name for the executable that hosts the Web Browser component.
R	ReadyState (see page 538)	Indicates the state of the Web browser component.
R	TopLevelContainer (see page 543)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 544)	Indicates the type name of the contained document object.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 545)	Occurs immediately before the Web browser navigates to a new resource.
	OnClientToHostWindow (see page 546)	This is OnClientToHostWindow, a member of class TWebBrowser.
	OnCommandStateChange (see page 546)	Occurs when the ability to execute certain TWebBrowser (see page 504) methods changes.
	OnDocumentComplete (see page 546)	Occurs when the document being navigated to reaches ReadyState_Complete.
	OnDownloadBegin (see page 547)	Occurs when the Web browser starts downloading a document.
	OnDownloadComplete (see page 547)	Occurs when a navigation operation finishes, is halted, or fails.
	OnDragDrop (see page 548)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 551)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 554)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 555)	Occurs when a control receives the input focus.

	OnExit (see page 558)	Occurs when the input focus shifts away from one control to another.
	OnFileDownload (see page 562)	This is OnFileDownload, a member of class TWebBrowser.
	OnFullScreen (see page 562)	Not used in TWebBrowser (see page 504).
	OnMenuBar (see page 562)	Not used in TWebBrowser (see page 504).
	OnNavigateComplete2 (see page 562)	Occurs immediately after the Web browser successfully navigates to a new location.
	OnNavigateError (see page 563)	This is OnNavigateError, a member of class TWebBrowser.
	OnNewWindow2 (see page 563)	Occurs when a new, hidden, non-navigated Web browser window is needed.
	OnPrintTemplateInstantiation (see page 563)	This is OnPrintTemplateInstantiation, a member of class TWebBrowser.
	OnPrintTemplateTeardown (see page 564)	This is OnPrintTemplateTeardown, a member of class TWebBrowser.
	OnPrivacyImpactedStateChange (see page 564)	This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.
	OnProgressChange (see page 564)	Occurs when the progress of a download operation is updated.
	OnPropertyChange (see page 565)	Not used in TWebBrowser (see page 504).
	OnQuit (see page 565)	Not used in TWebBrowser (see page 504).
	OnSetSecureLockIcon (see page 565)	This is OnSetSecureLockIcon, a member of class TWebBrowser.
	OnStartDrag (see page 565)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusBar (see page 566)	Not used in TWebBrowser (see page 504).
	OnStatusTextChange (see page 566)	Not used in TWebBrowser (see page 504).
	OnTheaterMode (see page 567)	Not used in TWebBrowser (see page 504).
	OnTitleChange (see page 567)	Occurs when the title of a document in the WebBrowser (see page 837) control becomes available or changes.
	OnToolBar (see page 567)	Not used in TWebBrowser (see page 504).
	OnUpdatePageStatus (see page 567)	This is OnUpdatePageStatus, a member of class TWebBrowser.
	OnVisible (see page 568)	Occurs when the Web browser window is about to be shown or hidden.
	OnWindowClosing (see page 568)	This is OnWindowClosing, a member of class TWebBrowser.
	OnWindowSetHeight (see page 568)	This is OnWindowSetHeight, a member of class TWebBrowser.
	OnWindowSetLeft (see page 568)	This is OnWindowSetLeft, a member of class TWebBrowser.
	OnWindowSetResizable (see page 569)	This is OnWindowSetResizable, a member of class TWebBrowser.
	OnWindowSetTop (see page 569)	This is OnWindowSetTop, a member of class TWebBrowser.
	OnWindowSetWidth (see page 569)	This is OnWindowSetWidth, a member of class TWebBrowser.

Published Properties

	Name	Description
	AddressBar (see page 520)	Not used in TWebBrowser (see page 504).
	Align (see page 520)	Determines how the control aligns within its container (parent control).
	Anchors (see page 523)	Specifies how the control is anchored to its parent.
	DragCursor (see page 526)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 527)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FullScreen (see page 529)	Not used in TWebBrowser (see page 504).
	MenuBar (see page 530)	Not used in TWebBrowser (see page 504).
	Offline (see page 531)	Indicates whether the Web browser gets its document from the local cache.
	ParentShowHint (see page 532)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 533)	Identifies the pop-up menu associated with the control.
	RegisterAsBrowser (see page 538)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 539)	Specifies whether users can load a document using drag-and-drop.
	Resizable (see page 539)	Not used in TWebBrowser (see page 504).
	ShowHint (see page 539)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Silent (see page 541)	Specifies whether the Web browser can display dialog boxes.
	StatusBar (see page 541)	Not used in TWebBrowser (see page 504).
	StatusText (see page 541)	Not used in TWebBrowser (see page 504).
	TabOrder (see page 542)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 542)	Determines if the user can tab to a control.
	TheaterMode (see page 543)	Not used in TWebBrowser (see page 504).

	ToolBar (see page 543)	Not used in TWebBrowser (see page 504).
	Visible (see page 544)	Specifies whether the Web browser component appears onscreen.

8.1.12.2 TWebBrowser Methods

The methods of the TWebBrowser class are listed here.

Protected Methods

	Name	Description
	CreateControl (see page 508)	This is CreateControl, a member of class TWebBrowser.
	Get_Application (see page 509)	This is Get_Application, a member of class TWebBrowser.
	Get_Container (see page 509)	This is Get_Container, a member of class TWebBrowser.
	Get_Document (see page 509)	This is Get_Document, a member of class TWebBrowser.
	Get_Parent (see page 509)	This is Get_Parent, a member of class TWebBrowser.
	InitControlData (see page 512)	This is InitControlData, a member of class TWebBrowser.

Public Methods

	Name	Description
	ClientToWindow (see page 507)	Not used in TWebBrowser (see page 504).
	ExecWB (see page 508)	This is the overview for the ExecWB method overload.
	GetProperty (see page 510)	Not used in TWebBrowser (see page 504).
	GoBack (see page 510)	Navigates to the previous item in the history list.
	GoForward (see page 510)	Navigates to the next item in the history list.
	GoHome (see page 511)	Navigates to the current start page.
	GoSearch (see page 511)	Navigates to the current search page.
	Navigate (see page 512)	This is the overview for the Navigate method overload.
	Navigate2 (see page 514)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 515)	Not used in TWebBrowser (see page 504).
	QueryStatusWB (see page 516)	Returns information about what commands the Web browser supports.
	Quit (see page 516)	Not used in TWebBrowser (see page 504).
	Refresh (see page 516)	Reloads the current document.
	Refresh2 (see page 517)	This is the overview for the Refresh2 method overload.
	ShowBrowserBar (see page 518)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 518)	Stops the current operation.

8.1.12.2.1 TWebBrowser.ClientToWindow Method

Not used in TWebBrowser (see page 504).

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Internet Explorer uses ClientToWindow to convert between client coordinates and window coordinates.

8.1.12.2.2 TWebBrowser.CreateControl Method

Pascal

```
procedure CreateControl;
```

C++

```
__fastcall CreateControl();
```

Description

This is CreateControl, a member of class TWebBrowser.

8.1.12.2.3 ExecWB Method

This is the overview for the ExecWB method overload.

Overload List

	Name	Description
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT) (see page 508)	Executes a command.
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant) (see page 508)	Executes a command.
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant) (see page 508)	Executes a command.

8.1.12.2.3.1 TWebBrowser.ExecWB Method (OLECMDID, OLECMDEXECOPT)

Executes a command.

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT); overload;
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant); overload;
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt);
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn);
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

ExecWB lets you use the IOleCommandTarget interface to pass a command to the Web browser control. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command to execute. The Web Browser does not support all of the commands for which Microsoft providesconstants. Use the QueryStatusWB (see page 516) method to determine what commands can be used.

cmdexecopt modifies how the command is executed.

pvaIn specifies a Variant (see page 3421) array that contains any input arguments. This value can be omitted if there are not input arguments.

pvaOutspecifies a Variant (see page 3421) that receives the results of the command, if any. This value can be omitted if there are no results.

See Also

QueryStatusWB (see page 516)

DoObjectVerb

GetObjectVerbs

8.1.12.2.4 TWebBrowser.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TWebBrowser.

8.1.12.2.5 TWebBrowser.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TWebBrowser.

8.1.12.2.6 TWebBrowser.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TWebBrowser.

8.1.12.2.7 TWebBrowser.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TWebBrowser.

8.1.12.2.8 TWebBrowser.GetProperty Method

Not used in TWebBrowser (see page 504).

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Internet Explorer uses GetProperty to return a property value.

8.1.12.2.9 TWebBrowser.GoBack Method

Navigates to the previous item in the history list.

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

Call GoBack to return to the last document in the history list. GoBack has no effect unless the history list contains additional documents.

Note: The Navigate (see page 512) or Navigate2 (see page 514) command can change the history list, depending on the specified flags.

See Also

OnCommandStateChange (see page 546)

GoForward (see page 510)

GoHome (see page 511)

GoSearch (see page 511)

Navigate (see page 512)

Navigate2 (see page 514)

8.1.12.2.10 TWebBrowser.GoForward Method

Navigates to the next item in the history list.

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

Call GoForward to return to the next document in the history list. GoForward reverses the effect of the last GoBack (see page

510) command.

See Also

OnCommandStateChange (see page 546)

GoBack (see page 510)

GoHome (see page 511)

GoSearch (see page 511)

8.1.12.2.11 TWebBrowser.GoHome Method

Navigates to the current start page.

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

Call GoHome to navigate to the registered home or start page. The URL for this page is specified in the Registry at

`HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main`

under the name Startpage. You can change this value using the TRegistry or TRegistryIniFile object, or using Navigation tab of the Internet Explorer's Options dialog.

GoForward (see page 510)

GoSearch (see page 511)

TRegistry

TRegistryIniFile

8.1.12.2.12 TWebBrowser.GoSearch Method

Navigates to the current search page.

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

Call GoSearch to navigate to the registered search page. The URL for this page is specified in the Registry at

`HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main`

under the name SearchPage. You can change this value using the TRegistry or TRegistryIniFile object, or using Navigation tab of the Internet Explorer's Options dialog.

8.1.12.2.13 TWebBrowser.InitControlData Method

Pascal

```
procedure InitControlData; override;
```

C++

```
virtual __fastcall InitControlData();
```

Description

This is InitControlData, a member of class TWebBrowser.

8.1.12.2.14 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TWebBrowser.Navigate (WideString) (see page 512)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant) (see page 512)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant, OleVariant) (see page 512)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 512)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 512)	Navigates to a resource identified by a path name or URL.

8.1.12.2.14.1 TWebBrowser.Navigate Method (WideString)

Navigates to a resource identified by a path name or URL.

Pascal

```
procedure Navigate(const URL: WideString); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

Use Navigate to locate and download a specific resource. Navigate can send an HTTP message to a specified URL and display the results or simply display the results of a specified file.

URL specifies the UNC path name of a file or the Uniform Resource Locator of an Internet resource that the Web browser should display.

Flags is a set of values that specify whether to add the resource to the history list, whether to read from or write to the cache, and whether to display the resource in a new window. It can be a sum of zero or more of the following:

Constant	Value	Meaning
navOpenInNewWindow (see page 854)	1	Open the resource or file in a new window.
navNoHistory (see page 853)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 854)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 854)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 853)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate to generate an HTTP POST message. If PostData is NULL, Navigate generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify such things as the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

Note: To navigate to a location that can't be expressed as an URL (for example, to an item identifier list), use the Navigate2 (see page 514) method instead.

8.1.12.2.15 Navigate2 Method

This is the overview for the Navigate2 method overload.

Overload List

	Name	Description
	TWebBrowser.Navigate2 (OleVariant) (see page 514)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant) (see page 514)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant) (see page 514)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant) (see page 514)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant) (see page 514)	Navigates to a specified resource.

8.1.12.2.15.1 TWebBrowser.Navigate2 Method (OleVariant)

Navigates to a specified resource.

Pascal

```
procedure Navigate2(var URL: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant; var Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL);
__fastcall Navigate2(OleVariant URL, OleVariant Flags);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData, OleVariant Headers);
```

Description

Use Navigate2 to locate and download a specific resource. Navigate (see page 512) can send an HTTP message to a specified URL and display the results, display the results of a specified file, or navigate to a resource that can't be expressed as an URL such as an item identifier list.

URL specifies the UNC path name of a file, the Uniform Resource Locator of an Internet resource, or a pointer to an item identifier list (PIDL).

Flags is a set of values that specify whether to add the resource to the history list, whether to read from or write to the cache, and whether to display the resource in a new window. It can be a sum of zero or more of the following:

Constant	Value	Meaning
navOpenInNewWindow (see page 854)	1	Open the resource or file in a new window.
navNoHistory (see page 853)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 854)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 854)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 853)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate (see page 512) to generate an HTTP POST message. If PostData is NULL, Navigate (see page 512) generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify such things as the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

TWebRequest

8.1.12.2.16 TWebBrowser.PutProperty Method

Not used in TWebBrowser (see page 504).

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Internet Explorer uses PutProperty to set a property value.

8.1.12.2.17 TWebBrowser.QueryStatusWB Method

Returns information about what commands the Web browser supports.

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

Use QueryStatusWB to determine what commands can be executed using the ExecWB (see page 508) method. QueryStatusWB uses the QueryStatus method of the IOleCommandTarget interface to obtain information about the status of commands. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command about which you want information.

QueryStatusWB returns a value made by adding together flags that indicate the status of the command.

See Also

ExecWB (see page 508)

8.1.12.2.18 TWebBrowser.Quit Method

Not used in TWebBrowser (see page 504).

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

Do not use this method. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Internet Explorer responds to Quit by shutting down.

8.1.12.2.19 TWebBrowser.Refresh Method

Reloads the current document.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh to reload the current document. This is useful when the Web browser is displaying the resource at an URL that may have changed.

Refresh always sends a pragma:nocache header, telling the server not to return a cached copy. This can cause problems with some servers. To prevent the pragma:nocache header, or to refresh only expired pages, use the Refresh2 (see page 517) method instead.

See Also

Refresh2 (see page 517)

Document (see page 526)

8.1.12.2.20 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TWebBrowser.Refresh2 () (see page 517)	Reloads the current document if necessary.
	TWebBrowser.Refresh2 (OleVariant) (see page 517)	Reloads the current document if necessary.

8.1.12.2.20.1 TWebBrowser.Refresh2 Method ()

Reloads the current document if necessary.

Pascal

```
procedure Refresh2; overload;
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2();
__fastcall Refresh2(OleVariant Level);
```

Description

Call Refresh2 to reload the current document. Unlike the Refresh (see page 516) method, Refresh2 lets you specify what level of refresh to perform.

Level indicates what type of information is refreshed. The following table lists the possible values:

Constant	Value	Meaning
REFRESH_NORMAL (see page 878)	0	Perform a lightweight refresh that does not include the pragma:nocache header. The pragma:nocache header tells the server not to return a cached copy. This can cause problems with some servers.
REFRESH_IFEXPIRED (see page 878)	1	Only refresh if the page has expired. Do not include the pragma:nocache header.
REFRESH_CONTINUE (see page 877)	2	For internal use only.
REFRESH_COMPLETELY (see page 877)	3	Perform a full refresh, including the pragma:nocache header. Using this option is the same as calling the Refresh (see page 516) method.

When Level is omitted, a value of REFRESH_COMPLETELY (see page 877) is assumed.

See Also

Refresh (see page 516)

8.1.12.2.21 ShowBrowserBar Method

This is the overview for the ShowBrowserBar method overload.

Overload List

	Name	Description
	TWebBrowser.ShowBrowserBar (OleVariant) (see page 518)	Not used in TWebBrowser (see page 504)
	TWebBrowser.ShowBrowserBar (OleVariant, OleVariant) (see page 518)	Not used in TWebBrowser (see page 504)
	TWebBrowser.ShowBrowserBar (OleVariant, OleVariant, OleVariant) (see page 518)	Not used in TWebBrowser (see page 504)

8.1.12.2.21.1 TWebBrowser.ShowBrowserBar Method (OleVariant)

Not used in TWebBrowser (see page 504)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant); overload;
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant); overload;
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid);
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow);
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Internet Explorer uses ShowBrowserBar to show or hide a specified browser bar.

8.1.12.2.22 TWebBrowser.Stop Method

Stops the current operation.

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

Stop cancels any pending navigation or download operation and terminates any dynamic page elements, such as background sounds and animations.

8.1.12.3 TWebBrowser Properties

The properties of the TWebBrowser class are listed here.

Public Properties

	Name	Description
	Application (see page 524)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, the interface for the WebBrowser (see page 837) control.
	Busy (see page 524)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
	Container (see page 525)	Provides access to the automation interface of the Web browser's container.
	ControlInterface (see page 525)	Provides access to the interface for this Web browser component.
	DefaultInterface (see page 526)	Provides access to the default interface for the component.
	Document (see page 526)	Provides access to the Automation interface of the active document.
	FullName (see page 528)	Indicates the fully qualified path name for the executable that hosts the Web Browser component.
	HWnd (see page 529)	Provides access to the Window handle for the Web browser.
	LocationName (see page 529)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
	LocationURL (see page 530)	Identifies the URL or path of the document or folder currently displayed.
	Name (see page 531)	Indicates the name for the executable that hosts the Web Browser component.
	Parent (see page 531)	Provides access to the Automation interface of the Web browser's container.
	Path (see page 532)	Indicates the name for the executable that hosts the Web Browser component.
	ReadyState (see page 538)	Indicates the state of the Web browser component.
	TopLevelContainer (see page 543)	Indicates whether the Web browser is a top-level Automation object.
	type_ (see page 544)	Indicates the type name of the contained document object.

Published Properties

	Name	Description
	AddressBar (see page 520)	Not used in TWebBrowser (see page 504).
	Align (see page 520)	Determines how the control aligns within its container (parent control).
	Anchors (see page 523)	Specifies how the control is anchored to its parent.
	DragCursor (see page 526)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 527)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FullScreen (see page 529)	Not used in TWebBrowser (see page 504).
	MenuBar (see page 530)	Not used in TWebBrowser (see page 504).
	Offline (see page 531)	Indicates whether the Web browser gets its document from the local cache.
	ParentShowHint (see page 532)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 533)	Identifies the pop-up menu associated with the control.
	RegisterAsBrowser (see page 538)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 539)	Specifies whether users can load a document using drag-and-drop.
	Resizable (see page 539)	Not used in TWebBrowser (see page 504).
	ShowHint (see page 539)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Silent (see page 541)	Specifies whether the Web browser can display dialog boxes.
	StatusBar (see page 541)	Not used in TWebBrowser (see page 504).
	StatusText (see page 541)	Not used in TWebBrowser (see page 504).
	TabOrder (see page 542)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 542)	Determines if the user can tab to a control.

	TheaterMode (see page 543)	Not used in TWebBrowser (see page 504).
	ToolBar (see page 543)	Not used in TWebBrowser (see page 504).
	Visible (see page 544)	Specifies whether the Web browser component appears onscreen.

8.1.12.3.1 TWebBrowser.AddressBar Property

Not used in TWebBrowser (see page 504).

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

Do not use AddressBar. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. AddressBar shows or hides the URL address bar on Internet Explorer. TWebBrowser (see page 504) does not have an address bar.

8.1.12.3.2 TWebBrowser.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
```

```
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

Parent

Anchors

8.1.12.3.3 TWebBrowser.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

8.1.12.3.4 TWebBrowser.Application Property

Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, the interface for the WebBrowser (see page 837) control.

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

Use Application to access the interface for the application containing the WebBrowser (see page 837) control. If the application does not have an Automation interface, or if the interface is not accessible, Application provides access to the Automation interface of the Web browser control.

See Also

Container (see page 525)

Parent (see page 531)

ControlInterface (see page 525)

8.1.12.3.5 TWebBrowser.Busy Property

Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

Read (see page 3634) Busy to determine whether the Web browser component is currently navigating to a new URL or

downloading a document. If Busy is true, you can interrupt the current operation using the Stop (see page 518) method before starting a new operation.

Note: The Web browser receives events at the beginning and end of each operation, as well as at discrete points during a download operation.

8.1.12.3.6 TWebBrowser.Container Property

Provides access to the automation interface of the Web browser's container.

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

Use Container to access the interface for the Web browser's parent or container. If the Web browser does not have a container with an Automation interface, Container is nil.

See Also

Application (see page 524)

Parent (see page 531)

ControlInterface (see page 525)

TopLevelContainer (see page 543)

8.1.12.3.7 TWebBrowser.ControlInterface Property

Provides access to the interface for this Web browser component.

Pascal

```
property ControlInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 ControlInterface;
```

Description

Use ControlInterface to access the interface for the WebBrowser (see page 837) component. This interface lets an Automation

controller access the properties, methods, and events of the Web browser.

See Also

Application (see page 524)

Document (see page 526)

Parent (see page 531)

DefaultInterface (see page 526)

8.1.12.3.8 TWebBrowser.DefaultInterface Property

Provides access to the default interface for the component.

Pascal

```
property DefaultInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 DefaultInterface;
```

Description

Use DefaultInterface to access the default interface for the component. As implemented in TWebBrowser (see page 504), this is the same as the ControlInterface (see page 525) property.

See Also

ControlInterface (see page 525)

8.1.12.3.9 TWebBrowser.Document Property

Provides access to the Automation interface of the active document.

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

Use Document to access an IDispatch (see page 3494) interface for manipulating the contents of the HTML document through the COM object model. If there is no active document, Document is nil. That is, you must first load a document using the Navigate (see page 512) or Navigate2 (see page 514) method before you can manipulate it using the Document interface.

For more information about this interface, see the document object section of Microsoft's Dynamic HTML reference.

See Also

ControlInterface (see page 525)

Navigate (see page 512)

Navigate2 (see page 514)

8.1.12.3.10 TWebBrowser.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

8.1.12.3.11 TWebBrowser.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}
```

```
void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;

Arranging the Order of Persistent Columns

8.1.12.3.12 TWebBrowser.FullName Property

Indicates the fully qualified path name for the executable that hosts the Web Browser component.

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

Read (see page 3634) FullName to obtain the name of the executable as a WideString (see page 3467). Unlike the Name (see page 531) property, FullName specifies a fully qualified path name.

See Also

Application (see page 524)

ExeName

Name (see page 531)

Path (see page 532)

8.1.12.3.13 TWebBrowser.FullScreen Property

Not used in TWebBrowser (see page 504).

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

Do not use FullScreen. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. FullScreen determines whether Internet Explorer is maximized.

8.1.12.3.14 TWebBrowser.HWnd Property

Provides access to the Window handle for the Web browser.

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

Use HWnd for Windows API calls that require a window handle. Use HWnd instead of the Handle property when working with TWebBrowser (see page 504) controls.

See Also

Handle

8.1.12.3.15 TWebBrowser.LocationName Property

Identifies the short (UI-friendly) name of the URL or file currently displayed.

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

Read (see page 3634) LocationName to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName is the title of that page. If the resource is a folder or file on the local network or on a disk, LocationName is the full UNC name of the folder or file.

See Also

LocationURL (see page 530)

OnTitleChange (see page 567)

8.1.12.3.16 TWebBrowser.LocationURL Property

Identifies the URL or path of the document or folder currently displayed.

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

Read (see page 3634) LocationURL to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName (see page 529) is its URL. If the resource is a folder or file on the local network or on a disk, LocationName (see page 529) is the full UNC name of the folder or file.

Note: LocationURL is a read-only property. To direct the Web browser to display the resource at a specific URL, folder, or file, use the Navigate (see page 512) or Navigate2 (see page 514) method.

See Also

LocationName (see page 529)

Navigate (see page 512)

Navigate2 (see page 514)

8.1.12.3.17 TWebBrowser.MenuBar Property

Not used in TWebBrowser (see page 504).

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

Do not use MenuBar. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. MenuBar shows or hides the menu bar in Internet Explorer. TWebBrowser (see page 504) does not have a menu bar.

8.1.12.3.18 TWebBrowser.Name Property

Indicates the name for the executable that hosts the Web Browser component.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Read (see page 3634) Name to obtain the name of the executable that hosts the Web browser. Unlike the FullName (see page 528) property, Name does not include the path.

See Also

Application (see page 524)

FullName (see page 528)

Path (see page 532)

8.1.12.3.19 TWebBrowser.Offline Property

Indicates whether the Web browser gets its document from the local cache.

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

Set Offline to true to work offline with the Web browser. When the Web browser is offline, it can't read HTML pages using an Internet connection. Instead, you must specify a source document as a UNC filename.

Note: You can use Internet Explorer to save HTML pages to a local cache so that they are available for offline work.

See Also

Navigate (see page 512)

Navigate2 (see page 514)

8.1.12.3.20 TWebBrowser.Parent Property

Provides access to the Automation interface of the Web browser's container.

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

Use Parent to access the interface for the Web browser's parent or container. If the Web browser does not have a container with an Automation interface, the value of Parent is the same as ControlInterface (see page 525).

Use the TopLevelContainer (see page 543) property to determine which interface is the value of Parent.

See Also

Container (see page 525)

ControlInterface (see page 525)

Application (see page 524)

TopLevelContainer (see page 543)

8.1.12.3.21 TWebBrowser.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

8.1.12.3.22 TWebBrowser.Path Property

Indicates the name for the executable that hosts the Web Browser component.

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

Read (see page 3634) Path to obtain the path of the executable that hosts the Web browser.

See Also

FullName (see page 528)

Name (see page 531)

8.1.12.3.23 TWebBrowser.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      // The owner (PopupMenu1) will cleanup this menu item.
      TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
      int index = PopupMenu1->Items->Count;
      PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
      NewItem->Caption = "Menu Item " + IntToStr(index);
      NewItem->Tag = index;
      NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
      TNotifyEvent();
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
              }
              case 1:
              {
                  ShowMessage("second item clicked");
                  break;
              }
              case 2:
              {
                  ShowMessage("third item clicked");
```

```
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
```

```
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{

8.1.12.3.24 TWebBrowser.ReadyState Property

Indicates the state of the Web browser component.

Pascal

```
property ReadyState: TOleEnum;
```

C++

```
__property TOleEnum ReadyState;
```

Description

Read (see page 3634) ReadyState to obtain state information specific to the Web browser control. Use this information to avoid attempting to use the Web browser control when it is not ready to perform an action.

The following table lists the possible values:

Constant	Value	Meaning
READYSTATE_UNINITIALIZED (see page 877)	0	Default initialization state. The Control has not begun loading any properties.
READYSTATE_LOADING (see page 876)	1	The control is loading its properties.
READYSTATE_LOADED (see page 876)	2	The control has initialized its properties but is not yet interactive.
READYSTATE_INTERACTIVE (see page 876)	3	The control is interactive, but not all of its data is available. (It is downloading a document or frame).
READYSTATE_COMPLETE (see page 875)	4	The control is interactive and all of its data is available. (The current document is fully downloaded).

ComponentState

ControlState

Busy (see page 524)

8.1.12.3.25 TWebBrowser.RegisterAsBrowser Property

Registers the control as a top-level browser for target name resolution.

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

Set RegisterAsBrowser to true when using the Web browser control to implement a top-level browser.

8.1.12.3.26 TWebBrowser.RegisterAsDropTarget Property

Specifies whether users can load a document using drag-and-drop.

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

Set RegisterAsDropTarget to true to allow users to drop HTML documents onto the Web browser. When RegisterAsDropTarget is true, users can load a document by dragging it onto the Web browser. When RegisterAsDropTarget is false, dragging a document onto the Web browser has no effect.

See Also

Navigate (see page 512)

Navigate2 (see page 514)

8.1.12.3.27 TWebBrowser.Resizable Property

Not used in TWebBrowser (see page 504).

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

Do not use Resizable. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. Resizable determines whether the Internet Explorer window can be resized.

8.1.12.3.28 TWebBrowser.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

8.1.12.3.29 TWebBrowser.Silent Property

Specifies whether the Web browser can display dialog boxes.

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

Set Silent to true to prevent the Web browser control from displaying dialog boxes.

8.1.12.3.30 TWebBrowser.StatusBar Property

Not used in TWebBrowser (see page 504).

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

Do not use StatusBar. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. StatusBar shows or hides the status bar in Internet Explorer. TWebBrowser (see page 504) does not have a status bar.

8.1.12.3.31 TWebBrowser.StatusText Property

Not used in TWebBrowser (see page 504).

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

Do not use StatusText. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. StatusText specifies the text that appears on the status bar in Internet Explorer. TWebBrowser (see page 504) does not have a status bar.

8.1.12.3.32 TWebBrowser.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

8.1.12.3.33 TWebBrowser.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder

8.1.12.3.34 TWebBrowser.TheaterMode Property

Not used in TWebBrowser (see page 504).

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

Do not use TheaterMode. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. TheaterMode changes the display of Internet Explorer to use theater or normal mode.

8.1.12.3.35 TWebBrowser.ToolBar Property

Not used in TWebBrowser (see page 504).

Pascal

```
property ToolBar: Integer;
```

C++

```
__property int ToolBar;
```

Description

Do not use ToolBar. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. ToolBar determines which toolbar is displayed in Internet Explorer. TWebBrowser (see page 504) does not have any tool bars.

8.1.12.3.36 TWebBrowser.TopLevelContainer Property

Indicates whether the Web browser is a top-level Automation object.

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

Read (see page 3634) TopLevelContainer to determine whether the Web browser has a parent with an Automation interface. When TopLevelContainer is false, the Container (see page 525) and Parent (see page 531) properties provide access to the parent's interface. When TopLevelContainer is true, the value of Container (see page 525) is nil and the value of Parent (see page 531) is the Web browser's own interface.

See Also

Container (see page 525)

Parent (see page 531)

8.1.12.3.37 TWebBrowser.type_ Property

Indicates the type name of the contained document object.

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

Read (see page 3634) type_ to determine the type of the Automation object whose interface is represented by the Document (see page 526) property.

See Also

Container (see page 525)

Parent (see page 531)

Document (see page 526)

8.1.12.3.38 TWebBrowser.Visible Property

Specifies whether the Web browser component appears onscreen.

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

Use Visible to show or hide the Web browser control.

8.1.12.4 TWebBrowser Events

The events of the TWebBrowser class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 545)	Occurs immediately before the Web browser navigates to a new resource.
	OnClientToHostWindow (see page 546)	This is OnClientToHostWindow, a member of class TWebBrowser.
	OnCommandStateChange (see page 546)	Occurs when the ability to execute certain TWebBrowser (see page 504) methods changes.
	OnDocumentComplete (see page 546)	Occurs when the document being navigated to reaches ReadyState_Complete.
	OnDownloadBegin (see page 547)	Occurs when the Web browser starts downloading a document.
	OnDownloadComplete (see page 547)	Occurs when a navigation operation finishes, is halted, or fails.
	OnDragDrop (see page 548)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 551)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 554)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnEnter (see page 555)	Occurs when a control receives the input focus.
	OnExit (see page 558)	Occurs when the input focus shifts away from one control to another.
	OnFileDownload (see page 562)	This is OnFileDownload, a member of class TWebBrowser.
	OnFullScreen (see page 562)	Not used in TWebBrowser (see page 504).
	OnMenuBar (see page 562)	Not used in TWebBrowser (see page 504).
	OnNavigateComplete2 (see page 562)	Occurs immediately after the Web browser successfully navigates to a new location.
	OnNavigateError (see page 563)	This is OnNavigateError, a member of class TWebBrowser.
	OnNewWindow2 (see page 563)	Occurs when a new, hidden, non-navigated Web browser window is needed.
	OnPrintTemplateInstantiation (see page 563)	This is OnPrintTemplateInstantiation, a member of class TWebBrowser.
	OnPrintTemplateTeardown (see page 564)	This is OnPrintTemplateTeardown, a member of class TWebBrowser.
	OnPrivacyImpactedStateChange (see page 564)	This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.
	OnProgressChange (see page 564)	Occurs when the progress of a download operation is updated.
	OnPropertyChange (see page 565)	Not used in TWebBrowser (see page 504).
	OnQuit (see page 565)	Not used in TWebBrowser (see page 504).
	OnSetSecureLockIcon (see page 565)	This is OnSetSecureLockIcon, a member of class TWebBrowser.
	OnStartDrag (see page 565)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusBar (see page 566)	Not used in TWebBrowser (see page 504).
	OnStatusTextChange (see page 566)	Not used in TWebBrowser (see page 504).
	OnTheaterMode (see page 567)	Not used in TWebBrowser (see page 504).
	OnTitleChange (see page 567)	Occurs when the title of a document in the WebBrowser (see page 837) control becomes available or changes.
	OnToolBar (see page 567)	Not used in TWebBrowser (see page 504).
	OnUpdatePageStatus (see page 567)	This is OnUpdatePageStatus, a member of class TWebBrowser.
	OnVisible (see page 568)	Occurs when the Web browser window is about to be shown or hidden.
	OnWindowClosing (see page 568)	This is OnWindowClosing, a member of class TWebBrowser.
	OnWindowSetHeight (see page 568)	This is OnWindowSetHeight, a member of class TWebBrowser.
	OnWindowSetLeft (see page 568)	This is OnWindowSetLeft, a member of class TWebBrowser.
	OnWindowSetResizable (see page 569)	This is OnWindowSetResizable, a member of class TWebBrowser.
	OnWindowSetTop (see page 569)	This is OnWindowSetTop, a member of class TWebBrowser.
	OnWindowSetWidth (see page 569)	This is OnWindowSetWidth, a member of class TWebBrowser.

8.1.12.4.1 TWebBrowser.OnBeforeNavigate2 Event

Occurs immediately before the Web browser navigates to a new resource.

Pascal

```
property OnBeforeNavigate2: TWebBrowserBeforeNavigate2;
```

C++

```
__property TWebBrowserBeforeNavigate2 OnBeforeNavigate2;
```

Description

Write (see page 3707) an OnBeforeNavigate2 event handler to redirect or cancel a change to a different URL. This event may occur as the result of a call to the Navigate (see page 512) or Navigate2 (see page 514) method, or the user clicking a link.

See Also

Navigate (see page 512)

TWebRequest

8.1.12.4.2 TWebBrowser.OnClientToHostWindow Event

Pascal

```
property OnClientToHostWindow: TWebBrowserClientToHostWindow;
```

C++

```
__property TWebBrowserClientToHostWindow OnClientToHostWindow;
```

Description

This is OnClientToHostWindow, a member of class TWebBrowser.

8.1.12.4.3 TWebBrowser.OnCommandStateChange Event

Occurs when the ability to execute certain TWebBrowser (see page 504) methods changes.

Pascal

```
property OnCommandStateChange: TWebBrowserCommandStateChange;
```

C++

```
__property TWebBrowserCommandStateChange OnCommandStateChange;
```

Description

Write (see page 3707) an OnCommandStateChange to update any controls in the application whose state depends on the ability to execute the Web browser's methods.

See Also

Stop (see page 518)

GoBack (see page 510)

GoForward (see page 510)

Busy (see page 524)

QueryStatusWB (see page 516)

8.1.12.4.4 TWebBrowser.OnDocumentComplete Event

Occurs when the document being navigated to reaches ReadyState_Complete.

Pascal

```
property OnDocumentComplete: TWebBrowserDocumentComplete;
```

C++

```
__property TWebBrowserDocumentComplete OnDocumentComplete;
```

Description

Write (see page 3707) an OnDocumentComplete event handler to take specific action when a frame or document is fully loaded into the Web browser .For a document without frames, this event occurs once when the document finishes loading. On a document containing multiple frames, this event occurs once for each frame. When the multiple-frame document finishes loading, the Web browser fires the event one final time.

See Also

ReadyState (see page 538)

OnDownloadComplete (see page 547)

Busy (see page 524)

Navigate (see page 512)

Navigate2 (see page 514)

OnBeforeNavigate2 (see page 545)

8.1.12.4.5 TWebBrowser.OnDownloadBegin Event

Occurs when the Web browser starts downloading a document.

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

Write (see page 3707) an OnDownloadBegin event handler to take specific action after the Web browser has located a document and immediately before it starts downloading the document. For example, use the OnDownloadBegin event to launch an animation control the represents downloading or a progress bar that is updated by an OnProgressChange (see page 564) event handler. The control can then be stopped in an OnDownloadComplete (see page 547) event handler.

Note: To take specific action when the Web browser looks up the resource, rather than when it begins downloading, use the OnBeforeNavigate2 (see page 545) event. OnDownloadBegin occurs shortly after OnBeforeNavigate2 (see page 545).

See Also

OnDocumentComplete (see page 546)

OnDownloadComplete (see page 547)

Navigate (see page 512)

Navigate2 (see page 514)

OnProgressChange (see page 564)

8.1.12.4.6 TWebBrowser.OnDownloadComplete Event

Occurs when a navigation operation finishes, is halted, or fails.

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

Write (see page 3707) an OnDownloadComplete event handler to take specific action after the Web browser stops a downloading operation. For example, use the OnDownloadComplete event to stop an download indication that is started in an OnDownloadBegin (see page 547) event handler.

Note: Unlike the OnNavigateComplete2 (see page 562) event, OnDownloadComplete occurs even if the Web browser does not successfully navigate to an URL.

See Also

OnDocumentComplete (see page 546)

OnDownloadBegin (see page 547)

Navigate (see page 512)

Navigate2 (see page 514)

OnNavigateComplete2 (see page 562)

8.1.12.4.7 TWebBrowser.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
```

```
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
type
  TForm1 = class(TForm)
    Panel1: TPanel;
    Label1: TLabel;

TDragObject

8.1.12.4.8 TWebBrowser.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}
```

```
void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

8.1.12.4.9 TWebBrowser.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
```

```
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

DragKind

8.1.12.4.10 TWebBrowser.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{

edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
```

```
  applied to the active control. Clicking the button sets the
  ActiveControl to the button.  That is why we need to save
  the ActiveControl in a shared OnEnter procedure.  In the rich
  edit, only the text selected converts.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
     FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
     FontDialog1.Execute;
  end;

  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    myActiveControl := ActiveControl;
  end;

  procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
  begin
    if myActiveControl is TEdit then
      with myActiveControl as TEdit do
         Font.Assign(TFontDialog(Sender).Font)
    else if myActiveControl is TRichEdit then
      with myActiveControl as TRichEdit do
        SelAttributes.Assign(TFontDialog(Sender).Font)
    else
      Beep;
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows
  system color for a window.  These event handlers could also
  be shared.
  }
  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    Edit1.Color := clYellow;
  end;

  procedure TForm1.Edit1Exit(Sender: TObject);
  begin
    Edit1.Color := clWindow;
  end;

  procedure TForm1.Memo1Enter(Sender: TObject);
  begin
    Memo1.Color := clYellow;
  end;

  procedure TForm1.Memo1Exit(Sender: TObject);
  begin
    Memo1.Color := clWindow;
  end;
```

8.1.12.4.11 TWebBrowser.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)

8.1.12.4.12 TWebBrowser.OnFileDownload Event

Pascal

```
property OnFileDownload: TWebBrowserFileDownload;
```

C++

```
__property TWebBrowserFileDownload OnFileDownload;
```

Description

This is OnFileDownload, a member of class TWebBrowser.

8.1.12.4.13 TWebBrowser.OnFullScreen Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnFullScreen: TWebBrowserOnFullScreen;
```

C++

```
__property TWebBrowserOnFullScreen OnFullScreen;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnFullScreen occurs with Internet Explorer when the application is maximized or restored from a maximized state.

8.1.12.4.14 TWebBrowser.OnMenuBar Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnMenuBar: TWebBrowserOnMenuBar;
```

C++

```
__property TWebBrowserOnMenuBar OnMenuBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnMenuBar occurs with Internet Explorer when the menu bar is hidden or shown.

8.1.12.4.15 TWebBrowser.OnNavigateComplete2 Event

Occurs immediately after the Web browser successfully navigates to a new location.

Pascal

```
property OnNavigateComplete2: TWebBrowserNavigateComplete2;
```

C++

```
__property TWebBrowserNavigateComplete2 OnNavigateComplete2;
```

Description

Write (see page 3707) an OnNavigateComplete2 event handler to take specific action when the Web browser successfully navigates to a new resource. The event can occur before the document is fully downloaded, but when it occurs at least part of

the document must be received and a viewer for the document created.

Note: Unlike the OnDownloadComplete (see page 547) event, OnNavigateComplete2 does not occur if the operation is not successful.

8.1.12.4.16 TWebBrowser.OnNavigateError Event

Pascal

```
property OnNavigateError: TWebBrowserNavigateError;
```

C++

```
__property TWebBrowserNavigateError OnNavigateError;
```

Description

This is OnNavigateError, a member of class TWebBrowser.

8.1.12.4.17 TWebBrowser.OnNewWindow2 Event

Occurs when a new, hidden, non-navigated Web browser window is needed.

Pascal

```
property OnNewWindow2: TWebBrowserNewWindow2;
```

C++

```
__property TWebBrowserNewWindow2 OnNewWindow2;
```

Description

Write (see page 3707) an OnNewWindow2 to take specific action immediately before the Web browser creates a new window for displaying a resource. This window may be needed because the user shift-clicked on a link, the user right-clicked on a link and chose "open in new window", the frame for the target URL does not yet exist, or the Navigate (see page 512) or Navigate2 (see page 514) requested that the target document appear in a new window.

C++

```
__property TWebBrowserPrivacyImpactedStateChange OnPrivacyImpactedStateChange;
```

Description

This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.

8.1.12.4.21 TWebBrowser.OnProgressChange Event

Occurs when the progress of a download operation is updated.

Pascal

```
property OnProgressChange: TWebBrowserProgressChange;
```

C++

```
__property TWebBrowserProgressChange OnProgressChange;
```

Description

Write (see page 3707) an OnProgressChange event handler to provide visual feedback about the download process. For example, an OnProgressChange event handler can update a TProgressBar component or display the number of bytes downloaded so far.

8.1.12.4.22 TWebBrowser.OnPropertyChange Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnPropertyChange: TWebBrowserPropertyChange;
```

C++

```
__property TWebBrowserPropertyChange OnPropertyChange;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnPropertyChange occurs with Internet Explorer when a property is modified using the PutProperty (see page 515) method.

8.1.12.4.23 TWebBrowser.OnQuit Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnQuit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnQuit;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnQuit occurs when the Internet Explorer is about to shut down.

8.1.12.4.24 TWebBrowser.OnSetSecureLockIcon Event

Pascal

```
property OnSetSecureLockIcon: TWebBrowserSetSecureLockIcon;
```

C++

```
__property TWebBrowserSetSecureLockIcon OnSetSecureLockIcon;
```

Description

This is OnSetSecureLockIcon, a member of class TWebBrowser.

8.1.12.4.25 TWebBrowser.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it

contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

TDragControlObjectEx

DragKind

OnDragOver

OnDragDrop

8.1.12.4.26 TWebBrowser.OnStatusBar Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnStatusBar: TWebBrowserOnStatusBar;
```

C++

```
__property TWebBrowserOnStatusBar OnStatusBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnStatusBar occurs when the Internet Explorer first shows or hides its status bar.

8.1.12.4.27 TWebBrowser.OnStatusTextChange Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnStatusTextChange: TWebBrowserStatusTextChange;
```

C++

```
__property TWebBrowserStatusTextChange OnStatusTextChange;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnStatusTextChange occurs when the text displayed in the Internet Explorer's status bar changes.

8.1.12.4.28 TWebBrowser.OnTheaterMode Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnTheaterMode: TWebBrowserOnTheaterMode;
```

C++

```
__property TWebBrowserOnTheaterMode OnTheaterMode;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnTheaterMode occurs when the Internet Explorer changes into or out of theater mode.

8.1.12.4.29 TWebBrowser.OnTitleChange Event

Occurs when the title of a document in the WebBrowser (see page 837) control becomes available or changes.

Pascal

```
property OnTitleChange: TWebBrowserTitleChange;
```

C++

```
__property TWebBrowserTitleChange OnTitleChange;
```

Description

Write (see page 3707) an OnTitleChange event handler to respond when the Web browser obtains information about the document title. Because the title can change while an HTML page is downloading, LocationName (see page 529) is originally set to the URL of the document. After the title specified in the HTML page, if any, becomes available, LocationName (see page 529) is changed to reflect the actual title.

See Also

LocationName (see page 529)

8.1.12.4.30 TWebBrowser.OnToolBar Event

Not used in TWebBrowser (see page 504).

Pascal

```
property OnToolBar: TWebBrowserOnToolBar;
```

C++

```
__property TWebBrowserOnToolBar OnToolBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 504) interface because the IWebBrowser2 (see page 749) interface is shared with Internet Explorer. OnToolBar occurs when the Internet Explorer changes which tool bars are visible.

8.1.12.4.31 TWebBrowser.OnUpdatePageStatus Event

Pascal

```
property OnUpdatePageStatus: TWebBrowserUpdatePageStatus;
```

C++

```
__property TWebBrowserUpdatePageStatus OnUpdatePageStatus;
```

Description

This is OnUpdatePageStatus, a member of class TWebBrowser.

8.1.12.4.32 TWebBrowser.OnVisible Event

Occurs when the Web browser window is about to be shown or hidden.

Pascal

```
property OnVisible: TWebBrowserOnVisible;
```

C++

```
__property TWebBrowserOnVisible OnVisible;
```

Description

Write (see page 3707) an OnVisible event handler to make adjustments to compensate for the appearance or disappearance of the Web browser window.

See Also

Visible (see page 544)

8.1.12.4.33 TWebBrowser.OnWindowClosing Event

Pascal

```
property OnWindowClosing: TWebBrowserWindowClosing;
```

C++

```
__property TWebBrowserWindowClosing OnWindowClosing;
```

Description

This is OnWindowClosing, a member of class TWebBrowser.

8.1.12.4.34 TWebBrowser.OnWindowSetHeight Event

Pascal

```
property OnWindowSetHeight: TWebBrowserWindowSetHeight;
```

C++

```
__property TWebBrowserWindowSetHeight OnWindowSetHeight;
```

Description

This is OnWindowSetHeight, a member of class TWebBrowser.

8.1.12.4.35 TWebBrowser.OnWindowSetLeft Event

Pascal

```
property OnWindowSetLeft: TWebBrowserWindowSetLeft;
```

C++

```
__property TWebBrowserWindowSetLeft OnWindowSetLeft;
```

Description

This is OnWindowSetLeft, a member of class TWebBrowser.

8.1.12.4.36 TWebBrowser.OnWindowSetResizable Event

Pascal

```
property OnWindowSetResizable: TWebBrowserWindowSetResizable;
```

C++

```
__property TWebBrowserWindowSetResizable OnWindowSetResizable;
```

Description

This is OnWindowSetResizable, a member of class TWebBrowser.

8.1.12.4.37 TWebBrowser.OnWindowSetTop Event

Pascal

```
property OnWindowSetTop: TWebBrowserWindowSetTop;
```

C++

```
__property TWebBrowserWindowSetTop OnWindowSetTop;
```

Description

This is OnWindowSetTop, a member of class TWebBrowser.

8.1.12.4.38 TWebBrowser.OnWindowSetWidth Event

Pascal

```
property OnWindowSetWidth: TWebBrowserWindowSetWidth;
```

C++

```
__property TWebBrowserWindowSetWidth OnWindowSetWidth;
```

Description

This is OnWindowSetWidth, a member of class TWebBrowser.

8.1.13 TWebBrowser_V1 Class

Class Hierarchy

Pascal

```
TWebBrowser_V1 = class(TOleControl);
```

C++

```
class TWebBrowser_V1 : public TOleControl;
```

File

SHDocVw

Description

This is class SHDocVw.TWebBrowser_V1.

8.1.13.1 TWebBrowser_V1 Members

The following tables list the members exposed by TWebBrowser_V1.

Protected Methods

	Name	Description
	CreateControl (see page 572)	This is CreateControl, a member of class TWebBrowser_V1.
	Get_Application (see page 572)	This is Get_Application, a member of class TWebBrowser_V1.
	Get_Container (see page 572)	This is Get_Container, a member of class TWebBrowser_V1.
	Get_Document (see page 572)	This is Get_Document, a member of class TWebBrowser_V1.
	Get_Parent (see page 572)	This is Get_Parent, a member of class TWebBrowser_V1.
	InitControlData (see page 574)	This is InitControlData, a member of class TWebBrowser_V1.

Public Methods

	Name	Description
	GoBack (see page 573)	This is GoBack, a member of class TWebBrowser_V1.
	GoForward (see page 573)	This is GoForward, a member of class TWebBrowser_V1.
	GoHome (see page 573)	This is GoHome, a member of class TWebBrowser_V1.
	GoSearch (see page 573)	This is GoSearch, a member of class TWebBrowser_V1.
	Navigate (see page 574)	This is the overview for the Navigate method overload.
	Refresh (see page 575)	Repaints the control on the screen.
	Refresh2 (see page 576)	This is the overview for the Refresh2 method overload.
	Stop (see page 576)	This is Stop, a member of class TWebBrowser_V1.

Public Properties

	Name	Description
	Application (see page 581)	This is Application, a member of class TWebBrowser_V1.
	Busy (see page 581)	This is Busy, a member of class TWebBrowser_V1.
	Container (see page 582)	This is Container, a member of class TWebBrowser_V1.
	ControlInterface (see page 582)	This is ControlInterface, a member of class TWebBrowser_V1.
	DefaultInterface (see page 582)	This is DefaultInterface, a member of class TWebBrowser_V1.
	Document (see page 582)	This is Document, a member of class TWebBrowser_V1.
	LocationName (see page 584)	This is LocationName, a member of class TWebBrowser_V1.
	LocationURL (see page 585)	This is LocationURL, a member of class TWebBrowser_V1.
	Parent (see page 585)	Indicates the parent of the control.
	TopLevelContainer (see page 595)	This is TopLevelContainer, a member of class TWebBrowser_V1.
	type_ (see page 595)	This is type_, a member of class TWebBrowser_V1.

Published Events

	Name	Description
	OnBeforeNavigate (see page 597)	This is OnBeforeNavigate, a member of class TWebBrowser_V1.
	OnCommandStateChange (see page 597)	This is OnCommandStateChange, a member of class TWebBrowser_V1.
	OnDownloadBegin (see page 598)	This is OnDownloadBegin, a member of class TWebBrowser_V1.
	OnDownloadComplete (see page 598)	This is OnDownloadComplete, a member of class TWebBrowser_V1.
	OnDragDrop (see page 598)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 601)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 604)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 605)	Occurs when a control receives the input focus.
	OnExit (see page 608)	Occurs when the input focus shifts away from one control to another.

	OnFrameBeforeNavigate (see page 612)	This is OnFrameBeforeNavigate, a member of class TWebBrowser_V1.
	OnFrameNavigateComplete (see page 612)	This is OnFrameNavigateComplete, a member of class TWebBrowser_V1.
	OnFrameNewWindow (see page 612)	This is OnFrameNewWindow, a member of class TWebBrowser_V1.
	OnNavigateComplete (see page 612)	This is OnNavigateComplete, a member of class TWebBrowser_V1.
	OnNewWindow (see page 613)	This is OnNewWindow, a member of class TWebBrowser_V1.
	OnProgressChange (see page 613)	This is OnProgressChange, a member of class TWebBrowser_V1.
	OnPropertyChange (see page 613)	This is OnPropertyChange, a member of class TWebBrowser_V1.
	OnQuit (see page 613)	This is OnQuit, a member of class TWebBrowser_V1.
	OnStartDrag (see page 613)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusTextChange (see page 614)	This is OnStatusTextChange, a member of class TWebBrowser_V1.
	OnTitleChange (see page 614)	This is OnTitleChange, a member of class TWebBrowser_V1.
	OnWindowActivate (see page 615)	This is OnWindowActivate, a member of class TWebBrowser_V1.
	OnWindowMove (see page 615)	This is OnWindowMove, a member of class TWebBrowser_V1.
	OnWindowResize (see page 615)	This is OnWindowResize, a member of class TWebBrowser_V1.

Published Properties

	Name	Description
	Align (see page 577)	Determines how the control aligns within its container (parent control).
	Anchors (see page 581)	Specifies how the control is anchored to its parent.
	DragCursor (see page 582)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 583)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ParentShowHint (see page 586)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 587)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 592)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 593)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 594)	Determines if the user can tab to a control.
	Visible (see page 595)	Determines whether the component appears onscreen.

8.1.13.2 TWebBrowser_V1 Methods

The methods of the TWebBrowser_V1 class are listed here.

Protected Methods

	Name	Description
	CreateControl (see page 572)	This is CreateControl, a member of class TWebBrowser_V1.
	Get_Application (see page 572)	This is Get_Application, a member of class TWebBrowser_V1.
	Get_Container (see page 572)	This is Get_Container, a member of class TWebBrowser_V1.
	Get_Document (see page 572)	This is Get_Document, a member of class TWebBrowser_V1.
	Get_Parent (see page 572)	This is Get_Parent, a member of class TWebBrowser_V1.
	InitControlData (see page 574)	This is InitControlData, a member of class TWebBrowser_V1.

Public Methods

	Name	Description
	GoBack (see page 573)	This is GoBack, a member of class TWebBrowser_V1.
	GoForward (see page 573)	This is GoForward, a member of class TWebBrowser_V1.
	GoHome (see page 573)	This is GoHome, a member of class TWebBrowser_V1.
	GoSearch (see page 573)	This is GoSearch, a member of class TWebBrowser_V1.
	Navigate (see page 574)	This is the overview for the Navigate method overload.
	Refresh (see page 575)	Repaints the control on the screen.
	Refresh2 (see page 576)	This is the overview for the Refresh2 method overload.
	Stop (see page 576)	This is Stop, a member of class TWebBrowser_V1.

8.1.13.2.1 TWebBrowser_V1.CreateControl Method

Pascal

```
procedure CreateControl;
```

C++

```
__fastcall CreateControl();
```

Description

This is CreateControl, a member of class TWebBrowser_V1.

8.1.13.2.2 TWebBrowser_V1.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TWebBrowser_V1.

8.1.13.2.3 TWebBrowser_V1.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TWebBrowser_V1.

8.1.13.2.4 TWebBrowser_V1.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TWebBrowser_V1.

8.1.13.2.5 TWebBrowser_V1.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TWebBrowser_V1.

8.1.13.2.6 TWebBrowser_V1.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class TWebBrowser_V1.

8.1.13.2.7 TWebBrowser_V1.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class TWebBrowser_V1.

8.1.13.2.8 TWebBrowser_V1.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class TWebBrowser_V1.

8.1.13.2.9 TWebBrowser_V1.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class TWebBrowser_V1.

8.1.13.2.10 TWebBrowser_V1.InitControlData Method

Pascal

```
procedure InitControlData; override;
```

C++

```
virtual __fastcall InitControlData();
```

Description

This is InitControlData, a member of class TWebBrowser_V1.

8.1.13.2.11 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TWebBrowser_V1.Navigate (WideString) (see page 574)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant) (see page 574)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant) (see page 575)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 575)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 575)	This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.11.1 TWebBrowser_V1.Navigate Method (WideString)

Pascal

```
procedure Navigate(const URL: WideString); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.11.2 TWebBrowser_V1.Navigate Method (WideString, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.11.3 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.11.4 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.11.5 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

8.1.13.2.12 TWebBrowser_V1.Refresh Method

Repaints the control on the screen.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh method to repaint the control immediately. Refresh calls the Repaint method. Use the Refresh and Repaint methods interchangeably.

Update

8.1.13.2.13 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TWebBrowser_V1.Refresh2 () (see page 576)	This is Refresh2, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Refresh2 (OleVariant) (see page 576)	This is Refresh2, a member of class TWebBrowser_V1.

8.1.13.2.13.1 TWebBrowser_V1.Refresh2 Method ()

Pascal

```
procedure Refresh2; overload;
```

C++

```
__fastcall Refresh2();
```

Description

This is Refresh2, a member of class TWebBrowser_V1.

8.1.13.2.13.2 TWebBrowser_V1.Refresh2 Method (OleVariant)

Pascal

```
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class TWebBrowser_V1.

8.1.13.2.14 TWebBrowser_V1.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class TWebBrowser_V1.

8.1.13.3 TWebBrowser_V1 Properties

The properties of the TWebBrowser_V1 class are listed here.

Public Properties

	Name	Description
	Application (see page 581)	This is Application, a member of class TWebBrowser_V1.
	Busy (see page 581)	This is Busy, a member of class TWebBrowser_V1.
	Container (see page 582)	This is Container, a member of class TWebBrowser_V1.
	ControlInterface (see page 582)	This is ControlInterface, a member of class TWebBrowser_V1.
	DefaultInterface (see page 582)	This is DefaultInterface, a member of class TWebBrowser_V1.
	Document (see page 582)	This is Document, a member of class TWebBrowser_V1.
	LocationName (see page 584)	This is LocationName, a member of class TWebBrowser_V1.
	LocationURL (see page 585)	This is LocationURL, a member of class TWebBrowser_V1.
	Parent (see page 585)	Indicates the parent of the control.
	TopLevelContainer (see page 595)	This is TopLevelContainer, a member of class TWebBrowser_V1.
	type_ (see page 595)	This is type_, a member of class TWebBrowser_V1.

Published Properties

	Name	Description
	Align (see page 577)	Determines how the control aligns within its container (parent control).
	Anchors (see page 581)	Specifies how the control is anchored to its parent.
	DragCursor (see page 582)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 583)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ParentShowHint (see page 586)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 587)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 592)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 593)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 594)	Determines if the user can tab to a control.
	Visible (see page 595)	Determines whether the component appears onscreen.

8.1.13.3.1 TWebBrowser_V1.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
```

```
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
```

```
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var
    I: Integer;

  procedure TForm1.Button1Click(Sender: TObject);
  var
    ProgressBar: TProgressBar;
  begin
    ProgressBar := TProgressBar.Create(Self);
    with ProgressBar do
    begin
      Parent := Self;
      Align := alBottom;
    end;
  end;
  {
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  }
  var
    PageControl1: TPageControl;
    pts: array[0..3] of TTabSheet;
  const
    TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

  procedure TForm1.FormCreate(Sender: TObject);
  const
    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

Parent

Anchors

8.1.13.3.2 TWebBrowser_V1.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

8.1.13.3.3 TWebBrowser_V1.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class TWebBrowser_V1.

8.1.13.3.4 TWebBrowser_V1.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class TWebBrowser_V1.

8.1.13.3.5 TWebBrowser_V1.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class TWebBrowser_V1.

8.1.13.3.6 TWebBrowser_V1.ControlInterface Property

Pascal

```
property ControlInterface: IWebBrowser;
```

C++

```
__property IWebBrowser ControlInterface;
```

Description

This is ControlInterface, a member of class TWebBrowser_V1.

8.1.13.3.7 TWebBrowser_V1.DefaultInterface Property

Pascal

```
property DefaultInterface: IWebBrowser;
```

C++

```
__property IWebBrowser DefaultInterface;
```

Description

This is DefaultInterface, a member of class TWebBrowser_V1.

8.1.13.3.8 TWebBrowser_V1.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class TWebBrowser_V1.

8.1.13.3.9 TWebBrowser_V1.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

Cursor

DragKind

DragMode

8.1.13.3.10 TWebBrowser_V1.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}
```

```
void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;

8.1.13.3.11 TWebBrowser_V1.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class TWebBrowser_V1.

8.1.13.3.12 TWebBrowser_V1.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class TWebBrowser_V1.

8.1.13.3.13 TWebBrowser_V1.Parent Property

Indicates the parent of the control.

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

Use the Parent property to get or set the parent of this control. The parent of a control is the control that contains the control. For example, if an application includes three radio buttons in a group box, the group box is the parent of the three radio buttons, and the radio buttons are the child controls of the group box.

To serve as a parent, a control must be an instance of a descendant of TWinControl.

When creating a new control at runtime, assign a Parent property value for the new control. Usually, this is a form, panel, group box, or some control that is designed to contain another. Changing the parent of a control moves the control onscreen so that it is displayed within the new parent. When the parent control moves, the child moves with the parent.

Some controls (such as ActiveX controls) are contained in native windows rather than in a parent VCL control. For these controls, the value of Parent is nil (Delphi) or NULL (C++) and the ParentWindow property specifies the window.

Note: The Parent property declared in TControl is similar to the Owner property declared in TComponent, in that the Parent of a control frees the control just as the Owner of a component frees that Component. However, the Parent of a control is always a windowed control that visually contains the control, and is responsible for writing the control to a stream when the form is saved. The Owner of a component is the component that was passed as a parameter in the constructor and, if assigned, initiates the process of saving all objects (including the control and its parent) when the form is saved.

C++ Examples:

```
/*
This example uses a button placed next to a group box. When the
user clicks the button, the group box becomes the parent of the
button, so the button moves inside the group box.
*/
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (Button1->Parent != GroupBox1) // second click?
  {
    RemoveControl(Button1);
    GroupBox1->InsertControl(Button1);
  }
}

/*
Note that it was necessary to remove the button from the Controls
property of the form before the button actually moves into the
group box. This code accomplishes the same thing:
*/

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Button2->Parent = GroupBox1;
}
```

Delphi Examples:

```
{
This example uses a button placed next to a group box. When the
user clicks the button, the group box becomes the parent of the
button, so the button moves inside the group box.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if (Button1.Parent <> GroupBox1) then // second click?
  begin
    RemoveControl(Button1);
    GroupBox1.InsertControl(Button1);
  end;
end;

{
Note that it was necessary to remove the button from the Controls
property of the form before the button actually moves into the
group box. This code accomplishes the same thing:
}

procedure TForm1.Button2Click(Sender: TObject);
begin
  Button2.Parent := GroupBox1;
end;
```

8.1.13.3.14 TWebBrowser_V1.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

8.1.13.3.15 TWebBrowser_V1.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
```

```
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

8.1.13.3.16 TWebBrowser_V1.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

8.1.13.3.17 TWebBrowser_V1.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

8.1.13.3.18 TWebBrowser_V1.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

8.1.13.3.19 TWebBrowser_V1.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class TWebBrowser_V1.

8.1.13.3.20 TWebBrowser_V1.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class TWebBrowser_V1.

8.1.13.3.21 TWebBrowser_V1.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```

8.1.13.4 TWebBrowser_V1 Events

The events of the TWebBrowser_V1 class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate (see page 597)	This is OnBeforeNavigate, a member of class TWebBrowser_V1.
	OnCommandStateChange (see page 597)	This is OnCommandStateChange, a member of class TWebBrowser_V1.
	OnDownloadBegin (see page 598)	This is OnDownloadBegin, a member of class TWebBrowser_V1.
	OnDownloadComplete (see page 598)	This is OnDownloadComplete, a member of class TWebBrowser_V1.
	OnDragDrop (see page 598)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 601)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 604)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 605)	Occurs when a control receives the input focus.
	OnExit (see page 608)	Occurs when the input focus shifts away from one control to another.
	OnFrameBeforeNavigate (see page 612)	This is OnFrameBeforeNavigate, a member of class TWebBrowser_V1.
	OnFrameNavigateComplete (see page 612)	This is OnFrameNavigateComplete, a member of class TWebBrowser_V1.
	OnFrameNewWindow (see page 612)	This is OnFrameNewWindow, a member of class TWebBrowser_V1.
	OnNavigateComplete (see page 612)	This is OnNavigateComplete, a member of class TWebBrowser_V1.
	OnNewWindow (see page 613)	This is OnNewWindow, a member of class TWebBrowser_V1.
	OnProgressChange (see page 613)	This is OnProgressChange, a member of class TWebBrowser_V1.
	OnPropertyChange (see page 613)	This is OnPropertyChange, a member of class TWebBrowser_V1.
	OnQuit (see page 613)	This is OnQuit, a member of class TWebBrowser_V1.
	OnStartDrag (see page 613)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusTextChange (see page 614)	This is OnStatusTextChange, a member of class TWebBrowser_V1.
	OnTitleChange (see page 614)	This is OnTitleChange, a member of class TWebBrowser_V1.
	OnWindowActivate (see page 615)	This is OnWindowActivate, a member of class TWebBrowser_V1.
	OnWindowMove (see page 615)	This is OnWindowMove, a member of class TWebBrowser_V1.
	OnWindowResize (see page 615)	This is OnWindowResize, a member of class TWebBrowser_V1.

8.1.13.4.1 TWebBrowser_V1.OnBeforeNavigate Event

Pascal

```
property OnBeforeNavigate: TWebBrowser_V1BeforeNavigate;
```

C++

```
__property TWebBrowser_V1BeforeNavigate OnBeforeNavigate;
```

Description

This is OnBeforeNavigate, a member of class TWebBrowser_V1.

8.1.13.4.2 TWebBrowser_V1.OnCommandStateChange Event

Pascal

```
property OnCommandStateChange: TWebBrowser_V1CommandStateChange;
```

C++

```
__property TWebBrowser_V1CommandStateChange OnCommandStateChange;
```

Description

This is OnCommandStateChange, a member of class TWebBrowser_V1.

8.1.13.4.3 TWebBrowser_V1.OnDownloadBegin Event

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

This is OnDownloadBegin, a member of class TWebBrowser_V1.

8.1.13.4.4 TWebBrowser_V1.OnDownloadComplete Event

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

This is OnDownloadComplete, a member of class TWebBrowser_V1.

8.1.13.4.5 TWebBrowser_V1.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}
```

```
void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
type

TDragObject

8.1.13.4.6 TWebBrowser_V1.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
  dragging of the label as soon as the user drags the label
  onto the panel:
  Note: Set the label's DragMode property to dmAutomatic.
  */
  void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

8.1.13.4.7 TWebBrowser_V1.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
```

```
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);

8.1.13.4.8 TWebBrowser_V1.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to

another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)

8.1.13.4.9 TWebBrowser_V1.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255 ,
as this validation test cannot be accomplished
using the edit mask property alone.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)

Description

This is OnProgressChange, a member of class TWebBrowser_V1.

8.1.13.4.16 TWebBrowser_V1.OnPropertyChange Event

Pascal

```
property OnPropertyChange: TWebBrowser_V1PropertyChange;
```

C++

```
__property TWebBrowser_V1PropertyChange OnPropertyChange;
```

Description

This is OnPropertyChange, a member of class TWebBrowser_V1.

8.1.13.4.17 TWebBrowser_V1.OnQuit Event

Pascal

```
property OnQuit: TWebBrowser_V1Quit;
```

C++

```
__property TWebBrowser_V1Quit OnQuit;
```

Description

This is OnQuit, a member of class TWebBrowser_V1.

8.1.13.4.18 TWebBrowser_V1.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

	IShellFavoritesNameSpace (see page 691)	This is class SHDocVw.IShellFavoritesNameSpace.
	IShellFavoritesNameSpaceDisp (see page 695)	This is class SHDocVw.IShellFavoritesNameSpaceDisp.
	IShellNameSpace (see page 700)	This is class SHDocVw.IShellNameSpace.
	IShellNameSpaceDisp (see page 709)	This is class SHDocVw.IShellNameSpaceDisp.
	IShellUIHelper (see page 716)	This is class SHDocVw.IShellUIHelper.
	IShellUIHelperDisp (see page 721)	This is class SHDocVw.IShellUIHelperDisp.
	IShellWindows (see page 725)	This is class SHDocVw.IShellWindows.
	IShellWindowsDisp (see page 729)	This is class SHDocVw.IShellWindowsDisp.
	IWebBrowser (see page 733)	IWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	IWebBrowser2 (see page 749)	IWebBrowser2 provides access to the Web browser functionality of Microsoft Shell Doc Object and Control Library (SHDOCVW.DLL).
	IWebBrowser2Disp (see page 763)	This is class SHDocVw.IWebBrowser2Disp.
	IWebBrowserApp (see page 776)	This is class SHDocVw.IWebBrowserApp.
	IWebBrowserAppDisp (see page 785)	This is class SHDocVw.IWebBrowserAppDisp.
	IWebBrowserDisp (see page 795)	This is class SHDocVw.IWebBrowserDisp.

8.2.1 _SearchAssistantEvents Interface

Class Hierarchy

SHDocVw._SearchAssistantEvents

Pascal

```
_SearchAssistantEvents = dispinterface;
```

C++

```
class _SearchAssistantEvents;
```

File

SHDocVw

Description

This is class SHDocVw._SearchAssistantEvents.

8.2.1.1 _SearchAssistantEvents Members

The following tables list the members exposed by _SearchAssistantEvents.

Public Methods

	Name	Description
	OnNewSearch (see page 617)	This is OnNewSearch, a member of class _SearchAssistantEvents.
	OnNextMenuSelect (see page 617)	This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

8.2.1.2 _SearchAssistantEvents Methods

The methods of the _SearchAssistantEvents class are listed here.

Public Methods

	Name	Description
	OnNewSearch (see page 617)	This is OnNewSearch, a member of class _SearchAssistantEvents.
	OnNextMenuSelect (see page 617)	This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

8.2.1.2.1 _SearchAssistantEvents.OnNewSearch Method

Pascal

```
procedure OnNewSearch;
```

C++

```
__fastcall OnNewSearch();
```

Description

This is OnNewSearch, a member of class _SearchAssistantEvents.

8.2.1.2.2 _SearchAssistantEvents.OnNextMenuSelect Method

Pascal

```
procedure OnNextMenuSelect(idItem: Integer);
```

C++

```
__fastcall OnNextMenuSelect(int idItem);
```

Description

This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

8.2.2 DShellNameSpaceEvents Interface

Class Hierarchy

Pascal

```
DShellNameSpaceEvents = dispinterface;
```

C++

```
class DShellNameSpaceEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DShellNameSpaceEvents.

8.2.2.1 DShellNameSpaceEvents Members

The following tables list the members exposed by DShellNameSpaceEvents.

Public Methods

	Name	Description
	DoubleClick (see page 618)	This is DoubleClick, a member of class DShellNameSpaceEvents.
	FavoritesSelectionChange (see page 619)	This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.
	Initialized (see page 619)	This is Initialized, a member of class DShellNameSpaceEvents.
	SelectionChange (see page 619)	This is SelectionChange, a member of class DShellNameSpaceEvents.

8.2.2.2 DShellNameSpaceEvents Methods

The methods of the DShellNameSpaceEvents class are listed here.

Public Methods

	Name	Description
	DoubleClick (see page 618)	This is DoubleClick, a member of class DShellNameSpaceEvents.
	FavoritesSelectionChange (see page 619)	This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.
	Initialized (see page 619)	This is Initialized, a member of class DShellNameSpaceEvents.
	SelectionChange (see page 619)	This is SelectionChange, a member of class DShellNameSpaceEvents.

8.2.2.2.1 DShellNameSpaceEvents.DoubleClick Method

Pascal

```
procedure DoubleClick;
```

C++

```
__fastcall DoubleClick();
```

Description

This is DoubleClick, a member of class DShellNameSpaceEvents.

8.2.2.2.2 DShellNameSpaceEvents.FavoritesSelectionChange Method

Pascal

```
procedure FavoritesSelectionChange(cItems: Integer; hItem: Integer; const strName: WideString;
const strUrl: WideString; cVisits: Integer; const strDate: WideString; fAvailableOffline:
Integer);
```

C++

```
__fastcall FavoritesSelectionChange(int cItems, int hItem, const BSTR strName, const BSTR
strUrl, int cVisits, const BSTR strDate, int fAvailableOffline);
```

Description

This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.

8.2.2.2.3 DShellNameSpaceEvents.Initialized Method

Pascal

```
procedure Initialized;
```

C++

```
__fastcall Initialized();
```

Description

This is Initialized, a member of class DShellNameSpaceEvents.

8.2.2.2.4 DShellNameSpaceEvents.SelectionChange Method

Pascal

```
procedure SelectionChange;
```

C++

```
__fastcall SelectionChange();
```

Description

This is SelectionChange, a member of class DShellNameSpaceEvents.

8.2.3 DShellWindowsEvents Interface

Class Hierarchy

Pascal

```
DShellWindowsEvents = dispinterface;
```

C++

```
class DShellWindowsEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DShellWindowsEvents.

8.2.3.1 DShellWindowsEvents Members

The following tables list the members exposed by DShellWindowsEvents.

Public Methods

	Name	Description
	WindowRegistered (see page 620)	This is WindowRegistered, a member of class DShellWindowsEvents.
	WindowRevoked (see page 620)	This is WindowRevoked, a member of class DShellWindowsEvents.

8.2.3.2 DShellWindowsEvents Methods

The methods of the DShellWindowsEvents class are listed here.

Public Methods

	Name	Description
	WindowRegistered (see page 620)	This is WindowRegistered, a member of class DShellWindowsEvents.
	WindowRevoked (see page 620)	This is WindowRevoked, a member of class DShellWindowsEvents.

8.2.3.2.1 DShellWindowsEvents.WindowRegistered Method

Pascal

```
procedure WindowRegistered(lCookie: Integer);
```

C++

```
__fastcall WindowRegistered(int lCookie);
```

Description

This is WindowRegistered, a member of class DShellWindowsEvents.

8.2.3.2.2 DShellWindowsEvents.WindowRevoked Method

Pascal

```
procedure WindowRevoked(lCookie: Integer);
```

C++

```
__fastcall WindowRevoked(int lCookie);
```

Description

This is WindowRevoked, a member of class DShellWindowsEvents.

8.2.4 DWebBrowserEvents Interface

Class Hierarchy

Pascal

```
DWebBrowserEvents = dispinterface;
```

C++

```
class DWebBrowserEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DWebBrowserEvents.

8.2.4.1 DWebBrowserEvents Members

The following tables list the members exposed by DWebBrowserEvents.

Public Methods

	Name	Description
	BeforeNavigate (see page 622)	This is BeforeNavigate, a member of class DWebBrowserEvents.
	CommandStateChange (see page 622)	This is CommandStateChange, a member of class DWebBrowserEvents.
	DownloadBegin (see page 622)	This is DownloadBegin, a member of class DWebBrowserEvents.
	DownloadComplete (see page 623)	This is DownloadComplete, a member of class DWebBrowserEvents.
	FrameBeforeNavigate (see page 623)	This is FrameBeforeNavigate, a member of class DWebBrowserEvents.
	FrameNavigateComplete (see page 623)	This is FrameNavigateComplete, a member of class DWebBrowserEvents.
	FrameNewWindow (see page 623)	This is FrameNewWindow, a member of class DWebBrowserEvents.
	NavigateComplete (see page 624)	This is NavigateComplete, a member of class DWebBrowserEvents.
	NewWindow (see page 624)	This is NewWindow, a member of class DWebBrowserEvents.
	ProgressChange (see page 624)	This is ProgressChange, a member of class DWebBrowserEvents.
	PropertyChange (see page 624)	This is PropertyChange, a member of class DWebBrowserEvents.
	Quit (see page 624)	This is Quit, a member of class DWebBrowserEvents.
	StatusTextChange (see page 625)	This is StatusTextChange, a member of class DWebBrowserEvents.
	TitleChange (see page 625)	This is TitleChange, a member of class DWebBrowserEvents.
	WindowActivate (see page 625)	This is WindowActivate, a member of class DWebBrowserEvents.
	WindowMove (see page 625)	This is WindowMove, a member of class DWebBrowserEvents.
	WindowResize (see page 626)	This is WindowResize, a member of class DWebBrowserEvents.

8.2.4.2 DWebBrowserEvents Methods

The methods of the DWebBrowserEvents class are listed here.

Public Methods

	Name	Description
	BeforeNavigate (see page 622)	This is BeforeNavigate, a member of class DWebBrowserEvents.

	CommandStateChange (see page 622)	This is CommandStateChange, a member of class DWebBrowserEvents.
	DownloadBegin (see page 622)	This is DownloadBegin, a member of class DWebBrowserEvents.
	DownloadComplete (see page 623)	This is DownloadComplete, a member of class DWebBrowserEvents.
	FrameBeforeNavigate (see page 623)	This is FrameBeforeNavigate, a member of class DWebBrowserEvents.
	FrameNavigateComplete (see page 623)	This is FrameNavigateComplete, a member of class DWebBrowserEvents.
	FrameNewWindow (see page 623)	This is FrameNewWindow, a member of class DWebBrowserEvents.
	NavigateComplete (see page 624)	This is NavigateComplete, a member of class DWebBrowserEvents.
	NewWindow (see page 624)	This is NewWindow, a member of class DWebBrowserEvents.
	ProgressChange (see page 624)	This is ProgressChange, a member of class DWebBrowserEvents.
	PropertyChange (see page 624)	This is PropertyChange, a member of class DWebBrowserEvents.
	Quit (see page 624)	This is Quit, a member of class DWebBrowserEvents.
	StatusTextChange (see page 625)	This is StatusTextChange, a member of class DWebBrowserEvents.
	TitleChange (see page 625)	This is TitleChange, a member of class DWebBrowserEvents.
	WindowActivate (see page 625)	This is WindowActivate, a member of class DWebBrowserEvents.
	WindowMove (see page 625)	This is WindowMove, a member of class DWebBrowserEvents.
	WindowResize (see page 626)	This is WindowResize, a member of class DWebBrowserEvents.

8.2.4.2.1 DWebBrowserEvents.BeforeNavigate Method

Pascal

```
procedure BeforeNavigate(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool);
```

C++

```
__fastcall BeforeNavigate(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Cancel);
```

Description

This is BeforeNavigate, a member of class DWebBrowserEvents.

8.2.4.2.2 DWebBrowserEvents.CommandStateChange Method

Pascal

```
procedure CommandStateChange(Command: Integer; Enable: WordBool);
```

C++

```
__fastcall CommandStateChange(int Command, WordBool Enable);
```

Description

This is CommandStateChange, a member of class DWebBrowserEvents.

8.2.4.2.3 DWebBrowserEvents.DownloadBegin Method

Pascal

```
procedure DownloadBegin;
```

C++

```
__fastcall DownloadBegin();
```

Description

This is DownloadBegin, a member of class DWebBrowserEvents.

8.2.4.2.4 DWebBrowserEvents.DownloadComplete Method

Pascal

```
procedure DownloadComplete;
```

C++

```
__fastcall DownloadComplete();
```

Description

This is DownloadComplete, a member of class DWebBrowserEvents.

8.2.4.2.5 DWebBrowserEvents.FrameBeforeNavigate Method

Pascal

```
procedure FrameBeforeNavigate(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool);
```

C++

```
__fastcall FrameBeforeNavigate(const BSTR URL, int Flags, const BSTR TargetFrameName,
OleVariant PostData, const BSTR Headers, WordBool Cancel);
```

Description

This is FrameBeforeNavigate, a member of class DWebBrowserEvents.

8.2.4.2.6 DWebBrowserEvents.FrameNavigateComplete Method

Pascal

```
procedure FrameNavigateComplete(const URL: WideString);
```

C++

```
__fastcall FrameNavigateComplete(const BSTR URL);
```

Description

This is FrameNavigateComplete, a member of class DWebBrowserEvents.

8.2.4.2.7 DWebBrowserEvents.FrameNewWindow Method

Pascal

```
procedure FrameNewWindow(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Processed: WordBool);
```

C++

```
__fastcall FrameNewWindow(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Processed);
```

Description

This is FrameNewWindow, a member of class DWebBrowserEvents.

8.2.4.2.8 DWebBrowserEvents.NavigateComplete Method

Pascal

```
procedure NavigateComplete(const URL: WideString);
```

C++

```
__fastcall NavigateComplete(const BSTR URL);
```

Description

This is NavigateComplete, a member of class DWebBrowserEvents.

8.2.4.2.9 DWebBrowserEvents.NewWindow Method

Pascal

```
procedure NewWindow(const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Processed: WordBool);
```

C++

```
__fastcall NewWindow(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Processed);
```

Description

This is NewWindow, a member of class DWebBrowserEvents.

8.2.4.2.10 DWebBrowserEvents.ProgressChange Method

Pascal

```
procedure ProgressChange(Progress: Integer; ProgressMax: Integer);
```

C++

```
__fastcall ProgressChange(int Progress, int ProgressMax);
```

Description

This is ProgressChange, a member of class DWebBrowserEvents.

8.2.4.2.11 DWebBrowserEvents.PropertyChange Method

Pascal

```
procedure PropertyChange(const Property_: WideString);
```

C++

```
__fastcall PropertyChange(const BSTR Property_);
```

Description

This is PropertyChange, a member of class DWebBrowserEvents.

8.2.4.2.12 DWebBrowserEvents.Quit Method

Pascal

```
procedure Quit(var Cancel: WordBool);
```

C++

```
__fastcall Quit(WordBool Cancel);
```

Description

This is Quit, a member of class DWebBrowserEvents.

8.2.4.2.13 DWebBrowserEvents.StatusTextChange Method

Pascal

```
procedure StatusTextChange(const Text: WideString);
```

C++

```
__fastcall StatusTextChange(const BSTR Text);
```

Description

This is StatusTextChange, a member of class DWebBrowserEvents.

8.2.4.2.14 DWebBrowserEvents.TitleChange Method

Pascal

```
procedure TitleChange(const Text: WideString);
```

C++

```
__fastcall TitleChange(const BSTR Text);
```

Description

This is TitleChange, a member of class DWebBrowserEvents.

8.2.4.2.15 DWebBrowserEvents.WindowActivate Method

Pascal

```
procedure WindowActivate;
```

C++

```
__fastcall WindowActivate();
```

Description

This is WindowActivate, a member of class DWebBrowserEvents.

8.2.4.2.16 DWebBrowserEvents.WindowMove Method

Pascal

```
procedure WindowMove;
```

C++

```
__fastcall WindowMove();
```

Description

This is WindowMove, a member of class DWebBrowserEvents.

8.2.4.2.17 DWebBrowserEvents.WindowResize Method

Pascal

```
procedure WindowResize;
```

C++

```
__fastcall WindowResize();
```

Description

This is WindowResize, a member of class DWebBrowserEvents.

8.2.5 DWebBrowserEvents2 Interface

Class Hierarchy

Pascal

```
DWebBrowserEvents2 = dispinterface;
```

C++

```
class DWebBrowserEvents2;
```

File

SHDocVw

Description

This is class SHDocVw.DWebBrowserEvents2.

8.2.5.1 DWebBrowserEvents2 Members

The following tables list the members exposed by DWebBrowserEvents2.

Public Methods

	Name	Description
	BeforeNavigate2 (see page 628)	This is BeforeNavigate2, a member of class DWebBrowserEvents2.
	ClientToHostWindow (see page 628)	This is ClientToHostWindow, a member of class DWebBrowserEvents2.
	CommandStateChange (see page 628)	This is CommandStateChange, a member of class DWebBrowserEvents2.
	DocumentComplete (see page 628)	This is DocumentComplete, a member of class DWebBrowserEvents2.
	DownloadBegin (see page 629)	This is DownloadBegin, a member of class DWebBrowserEvents2.
	DownloadComplete (see page 629)	This is DownloadComplete, a member of class DWebBrowserEvents2.
	FileDownload (see page 629)	This is FileDownload, a member of class DWebBrowserEvents2.
	NavigateComplete2 (see page 629)	This is NavigateComplete2, a member of class DWebBrowserEvents2.
	NavigateError (see page 629)	This is NavigateError, a member of class DWebBrowserEvents2.
	NewWindow2 (see page 630)	This is NewWindow2, a member of class DWebBrowserEvents2.
	OnFullScreen (see page 630)	This is OnFullScreen, a member of class DWebBrowserEvents2.
	OnMenuBar (see page 630)	This is OnMenuBar, a member of class DWebBrowserEvents2.
	OnQuit (see page 630)	This is OnQuit, a member of class DWebBrowserEvents2.
	OnStatusBar (see page 631)	This is OnStatusBar, a member of class DWebBrowserEvents2.
	OnTheaterMode (see page 631)	This is OnTheaterMode, a member of class DWebBrowserEvents2.

	OnToolBar (see page 631)	This is OnToolBar, a member of class DWebBrowserEvents2.
	OnVisible (see page 631)	This is OnVisible, a member of class DWebBrowserEvents2.
	PrintTemplateInstantiation (see page 631)	This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.
	PrintTemplateTeardown (see page 632)	This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.
	PrivacyImpactedStateChange (see page 632)	This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.
	ProgressChange (see page 632)	This is ProgressChange, a member of class DWebBrowserEvents2.
	PropertyChange (see page 632)	This is PropertyChange, a member of class DWebBrowserEvents2.
	SetSecureLockIcon (see page 633)	This is SetSecureLockIcon, a member of class DWebBrowserEvents2.
	StatusTextChange (see page 633)	This is StatusTextChange, a member of class DWebBrowserEvents2.
	TitleChange (see page 633)	This is TitleChange, a member of class DWebBrowserEvents2.
	UpdatePageStatus (see page 633)	This is UpdatePageStatus, a member of class DWebBrowserEvents2.
	WindowClosing (see page 633)	This is WindowClosing, a member of class DWebBrowserEvents2.
	WindowSetHeight (see page 634)	This is WindowSetHeight, a member of class DWebBrowserEvents2.
	WindowSetLeft (see page 634)	This is WindowSetLeft, a member of class DWebBrowserEvents2.
	WindowSetResizable (see page 634)	This is WindowSetResizable, a member of class DWebBrowserEvents2.
	WindowSetTop (see page 634)	This is WindowSetTop, a member of class DWebBrowserEvents2.
	WindowSetWidth (see page 635)	This is WindowSetWidth, a member of class DWebBrowserEvents2.

8.2.5.2 DWebBrowserEvents2 Methods

The methods of the DWebBrowserEvents2 class are listed here.

Public Methods

	Name	Description
	BeforeNavigate2 (see page 628)	This is BeforeNavigate2, a member of class DWebBrowserEvents2.
	ClientToHostWindow (see page 628)	This is ClientToHostWindow, a member of class DWebBrowserEvents2.
	CommandStateChange (see page 628)	This is CommandStateChange, a member of class DWebBrowserEvents2.
	DocumentComplete (see page 628)	This is DocumentComplete, a member of class DWebBrowserEvents2.
	DownloadBegin (see page 629)	This is DownloadBegin, a member of class DWebBrowserEvents2.
	DownloadComplete (see page 629)	This is DownloadComplete, a member of class DWebBrowserEvents2.
	FileDownload (see page 629)	This is FileDownload, a member of class DWebBrowserEvents2.
	NavigateComplete2 (see page 629)	This is NavigateComplete2, a member of class DWebBrowserEvents2.
	NavigateError (see page 629)	This is NavigateError, a member of class DWebBrowserEvents2.
	NewWindow2 (see page 630)	This is NewWindow2, a member of class DWebBrowserEvents2.
	OnFullScreen (see page 630)	This is OnFullScreen, a member of class DWebBrowserEvents2.
	OnMenuBar (see page 630)	This is OnMenuBar, a member of class DWebBrowserEvents2.
	OnQuit (see page 630)	This is OnQuit, a member of class DWebBrowserEvents2.
	OnStatusBar (see page 631)	This is OnStatusBar, a member of class DWebBrowserEvents2.
	OnTheaterMode (see page 631)	This is OnTheaterMode, a member of class DWebBrowserEvents2.
	OnToolBar (see page 631)	This is OnToolBar, a member of class DWebBrowserEvents2.
	OnVisible (see page 631)	This is OnVisible, a member of class DWebBrowserEvents2.
	PrintTemplateInstantiation (see page 631)	This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.
	PrintTemplateTeardown (see page 632)	This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.
	PrivacyImpactedStateChange (see page 632)	This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.
	ProgressChange (see page 632)	This is ProgressChange, a member of class DWebBrowserEvents2.
	PropertyChange (see page 632)	This is PropertyChange, a member of class DWebBrowserEvents2.
	SetSecureLockIcon (see page 633)	This is SetSecureLockIcon, a member of class DWebBrowserEvents2.
	StatusTextChange (see page 633)	This is StatusTextChange, a member of class DWebBrowserEvents2.
	TitleChange (see page 633)	This is TitleChange, a member of class DWebBrowserEvents2.
	UpdatePageStatus (see page 633)	This is UpdatePageStatus, a member of class DWebBrowserEvents2.
	WindowClosing (see page 633)	This is WindowClosing, a member of class DWebBrowserEvents2.
	WindowSetHeight (see page 634)	This is WindowSetHeight, a member of class DWebBrowserEvents2.
	WindowSetLeft (see page 634)	This is WindowSetLeft, a member of class DWebBrowserEvents2.

	WindowSetResizable (see page 634)	This is WindowSetResizable, a member of class DWebBrowserEvents2.
	WindowSetTop (see page 634)	This is WindowSetTop, a member of class DWebBrowserEvents2.
	WindowSetWidth (see page 635)	This is WindowSetWidth, a member of class DWebBrowserEvents2.

8.2.5.2.1 DWebBrowserEvents2.BeforeNavigate2 Method

Pascal

```
procedure BeforeNavigate2(const pDisp: IDispatch; const URL: OleVariant; const Flags:
OleVariant; const TargetFrameName: OleVariant; const PostData: OleVariant; const Headers:
OleVariant; var Cancel: WordBool);
```

C++

```
__fastcall BeforeNavigate2(const IDispatch pDisp, const OleVariant URL, const OleVariant
Flags, const OleVariant TargetFrameName, const OleVariant PostData, const OleVariant Headers,
WordBool Cancel);
```

Description

This is BeforeNavigate2, a member of class DWebBrowserEvents2.

8.2.5.2.2 DWebBrowserEvents2.ClientToHostWindow Method

Pascal

```
procedure ClientToHostWindow(var CX: Integer; var CY: Integer);
```

C++

```
__fastcall ClientToHostWindow(int CX, int CY);
```

Description

This is ClientToHostWindow, a member of class DWebBrowserEvents2.

8.2.5.2.3 DWebBrowserEvents2.CommandStateChange Method

Pascal

```
procedure CommandStateChange(Command: Integer; Enable: WordBool);
```

C++

```
__fastcall CommandStateChange(int Command, WordBool Enable);
```

Description

This is CommandStateChange, a member of class DWebBrowserEvents2.

8.2.5.2.4 DWebBrowserEvents2.DocumentComplete Method

Pascal

```
procedure DocumentComplete(const pDisp: IDispatch; var URL: OleVariant);
```

C++

```
__fastcall DocumentComplete(const IDispatch pDisp, OleVariant URL);
```

Description

This is DocumentComplete, a member of class DWebBrowserEvents2.

8.2.5.2.5 DWebBrowserEvents2.DownloadBegin Method

Pascal

```
procedure DownloadBegin;
```

C++

```
__fastcall DownloadBegin();
```

Description

This is DownloadBegin, a member of class DWebBrowserEvents2.

8.2.5.2.6 DWebBrowserEvents2.DownloadComplete Method

Pascal

```
procedure DownloadComplete;
```

C++

```
__fastcall DownloadComplete();
```

Description

This is DownloadComplete, a member of class DWebBrowserEvents2.

8.2.5.2.7 DWebBrowserEvents2.FileDownload Method

Pascal

```
procedure FileDownload(var Cancel: WordBool);
```

C++

```
__fastcall FileDownload(WordBool Cancel);
```

Description

This is FileDownload, a member of class DWebBrowserEvents2.

8.2.5.2.8 DWebBrowserEvents2.NavigateComplete2 Method

Pascal

```
procedure NavigateComplete2(const pDisp: IDispatch; var URL: OleVariant);
```

C++

```
__fastcall NavigateComplete2(const IDispatch pDisp, OleVariant URL);
```

Description

This is NavigateComplete2, a member of class DWebBrowserEvents2.

8.2.5.2.9 DWebBrowserEvents2.NavigateError Method

Pascal

```
procedure NavigateError(const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant;
var StatusCode: OleVariant; var Cancel: WordBool);
```

C++

```
__fastcall NavigateError(const IDispatch pDisp, OleVariant URL, OleVariant Frame, OleVariant
StatusCode, WordBool Cancel);
```

Description

This is NavigateError, a member of class DWebBrowserEvents2.

8.2.5.2.10 DWebBrowserEvents2.NewWindow2 Method

Pascal

```
procedure NewWindow2(var ppDisp: IDispatch; var Cancel: WordBool);
```

C++

```
__fastcall NewWindow2(IDispatch ppDisp, WordBool Cancel);
```

Description

This is NewWindow2, a member of class DWebBrowserEvents2.

8.2.5.2.11 DWebBrowserEvents2.OnFullScreen Method

Pascal

```
procedure OnFullScreen(FullScreen: WordBool);
```

C++

```
__fastcall OnFullScreen(WordBool FullScreen);
```

Description

This is OnFullScreen, a member of class DWebBrowserEvents2.

8.2.5.2.12 DWebBrowserEvents2.OnMenuBar Method

Pascal

```
procedure OnMenuBar(MenuBar: WordBool);
```

C++

```
__fastcall OnMenuBar(WordBool MenuBar);
```

Description

This is OnMenuBar, a member of class DWebBrowserEvents2.

8.2.5.2.13 DWebBrowserEvents2.OnQuit Method

Pascal

```
procedure OnQuit;
```

C++

```
__fastcall OnQuit();
```

Description

This is OnQuit, a member of class DWebBrowserEvents2.

8.2.5.2.14 DWebBrowserEvents2.OnStatusBar Method

Pascal

```
procedure OnStatusBar(StatusBar: WordBool);
```

C++

```
__fastcall OnStatusBar(WordBool StatusBar);
```

Description

This is OnStatusBar, a member of class DWebBrowserEvents2.

8.2.5.2.15 DWebBrowserEvents2.OnTheaterMode Method

Pascal

```
procedure OnTheaterMode(TheaterMode: WordBool);
```

C++

```
__fastcall OnTheaterMode(WordBool TheaterMode);
```

Description

This is OnTheaterMode, a member of class DWebBrowserEvents2.

8.2.5.2.16 DWebBrowserEvents2.OnToolBar Method

Pascal

```
procedure OnToolBar(ToolBar: WordBool);
```

C++

```
__fastcall OnToolBar(WordBool ToolBar);
```

Description

This is OnToolBar, a member of class DWebBrowserEvents2.

8.2.5.2.17 DWebBrowserEvents2.OnVisible Method

Pascal

```
procedure OnVisible(Visible: WordBool);
```

C++

```
__fastcall OnVisible(WordBool Visible);
```

Description

This is OnVisible, a member of class DWebBrowserEvents2.

8.2.5.2.18 DWebBrowserEvents2.PrintTemplateInstantiation Method

Pascal

```
procedure PrintTemplateInstantiation(const pDisp: IDispatch);
```

C++

```
__fastcall PrintTemplateInstantiation(const IDispatch pDisp);
```

Description

This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.

8.2.5.2.19 DWebBrowserEvents2.PrintTemplateTeardown Method

Pascal

```
procedure PrintTemplateTeardown(const pDisp: IDispatch);
```

C++

```
__fastcall PrintTemplateTeardown(const IDispatch pDisp);
```

Description

This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.

8.2.5.2.20 DWebBrowserEvents2.PrivacyImpactedStateChange Method

Pascal

```
procedure PrivacyImpactedStateChange(bImpacted: WordBool);
```

C++

```
__fastcall PrivacyImpactedStateChange(WordBool bImpacted);
```

Description

This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.

8.2.5.2.21 DWebBrowserEvents2.ProgressChange Method

Pascal

```
procedure ProgressChange(Progress: Integer; ProgressMax: Integer);
```

C++

```
__fastcall ProgressChange(int Progress, int ProgressMax);
```

Description

This is ProgressChange, a member of class DWebBrowserEvents2.

8.2.5.2.22 DWebBrowserEvents2.PropertyChange Method

Pascal

```
procedure PropertyChange(const szProperty: WideString);
```

C++

```
__fastcall PropertyChange(const BSTR szProperty);
```

Description

This is PropertyChange, a member of class DWebBrowserEvents2.

8.2.5.2.23 DWebBrowserEvents2.SetSecureLockIcon Method

Pascal

```
procedure SetSecureLockIcon(SecureLockIcon: Integer);
```

C++

```
__fastcall SetSecureLockIcon(int SecureLockIcon);
```

Description

This is SetSecureLockIcon, a member of class DWebBrowserEvents2.

8.2.5.2.24 DWebBrowserEvents2.StatusTextChange Method

Pascal

```
procedure StatusTextChange(const Text: WideString);
```

C++

```
__fastcall StatusTextChange(const BSTR Text);
```

Description

This is StatusTextChange, a member of class DWebBrowserEvents2.

8.2.5.2.25 DWebBrowserEvents2.TitleChange Method

Pascal

```
procedure TitleChange(const Text: WideString);
```

C++

```
__fastcall TitleChange(const BSTR Text);
```

Description

This is TitleChange, a member of class DWebBrowserEvents2.

8.2.5.2.26 DWebBrowserEvents2.UpdatePageStatus Method

Pascal

```
procedure UpdatePageStatus(const pDisp: IDispatch; var nPage: OleVariant; var fDone:
OleVariant);
```

C++

```
__fastcall UpdatePageStatus(const IDispatch pDisp, OleVariant nPage, OleVariant fDone);
```

Description

This is UpdatePageStatus, a member of class DWebBrowserEvents2.

8.2.5.2.27 DWebBrowserEvents2.WindowClosing Method

Pascal

```
procedure WindowClosing(IsChildWindow: WordBool; var Cancel: WordBool);
```

C++

```
__fastcall WindowClosing(WordBool IsChildWindow, WordBool Cancel);
```

Description

This is WindowClosing, a member of class DWebBrowserEvents2.

8.2.5.2.28 DWebBrowserEvents2.WindowSetHeight Method

Pascal

```
procedure WindowSetHeight(Height: Integer);
```

C++

```
__fastcall WindowSetHeight(int Height);
```

Description

This is WindowSetHeight, a member of class DWebBrowserEvents2.

8.2.5.2.29 DWebBrowserEvents2.WindowSetLeft Method

Pascal

```
procedure WindowSetLeft(Left: Integer);
```

C++

```
__fastcall WindowSetLeft(int Left);
```

Description

This is WindowSetLeft, a member of class DWebBrowserEvents2.

8.2.5.2.30 DWebBrowserEvents2.WindowSetResizable Method

Pascal

```
procedure WindowSetResizable(Resizable: WordBool);
```

C++

```
__fastcall WindowSetResizable(WordBool Resizable);
```

Description

This is WindowSetResizable, a member of class DWebBrowserEvents2.

8.2.5.2.31 DWebBrowserEvents2.WindowSetTop Method

Pascal

```
procedure WindowSetTop(Top: Integer);
```

C++

```
__fastcall WindowSetTop(int Top);
```

Description

This is WindowSetTop, a member of class DWebBrowserEvents2.

8.2.5.2.32 DWebBrowserEvents2.WindowSetWidth Method

Pascal

```
procedure WindowSetWidth(Width: Integer);
```

C++

```
__fastcall WindowSetWidth(int Width);
```

Description

This is WindowSetWidth, a member of class DWebBrowserEvents2.

8.2.6 IScriptErrorList Interface

Class Hierarchy

Pascal

```
IScriptErrorList = interface(IDispatch);
```

C++

```
__interface IScriptErrorList : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IScriptErrorList.

8.2.6.1 IScriptErrorList Members

The following tables list the members exposed by IScriptErrorList.

Public Methods

	Name	Description
	advanceError (see page 636)	This is advanceError, a member of class IScriptErrorList.
	canAdvanceError (see page 636)	This is canAdvanceError, a member of class IScriptErrorList.
	canRetreatError (see page 637)	This is canRetreatError, a member of class IScriptErrorList.
	getAlwaysShowLockState (see page 637)	This is getAlwaysShowLockState, a member of class IScriptErrorList.
	getDetailsPaneOpen (see page 637)	This is getDetailsPaneOpen, a member of class IScriptErrorList.
	getErrorChar (see page 637)	This is getErrorChar, a member of class IScriptErrorList.
	getErrorCode (see page 637)	This is getErrorCode, a member of class IScriptErrorList.
	getErrorLine (see page 638)	This is getErrorLine, a member of class IScriptErrorList.
	getErrorMsg (see page 638)	This is getErrorMsg, a member of class IScriptErrorList.
	getErrorUrl (see page 638)	This is getErrorUrl, a member of class IScriptErrorList.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	getPerErrorDisplay (see page 638)	This is getPerErrorDisplay, a member of class IScriptErrorList.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.

	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	retreatError (see page 639)	This is retreatError, a member of class IScriptErrorList.
	setDetailsPaneOpen (see page 639)	This is setDetailsPaneOpen, a member of class IScriptErrorList.
	setPerErrorDisplay (see page 639)	This is setPerErrorDisplay, a member of class IScriptErrorList.

8.2.6.2 IScriptErrorList Methods

The methods of the IScriptErrorList class are listed here.

Public Methods

	Name	Description
	advanceError (see page 636)	This is advanceError, a member of class IScriptErrorList.
	canAdvanceError (see page 636)	This is canAdvanceError, a member of class IScriptErrorList.
	canRetreatError (see page 637)	This is canRetreatError, a member of class IScriptErrorList.
	getAlwaysShowLockState (see page 637)	This is getAlwaysShowLockState, a member of class IScriptErrorList.
	getDetailsPaneOpen (see page 637)	This is getDetailsPaneOpen, a member of class IScriptErrorList.
	getErrorChar (see page 637)	This is getErrorChar, a member of class IScriptErrorList.
	getErrorCode (see page 637)	This is getErrorCode, a member of class IScriptErrorList.
	getErrorLine (see page 638)	This is getErrorLine, a member of class IScriptErrorList.
	getErrorMsg (see page 638)	This is getErrorMsg, a member of class IScriptErrorList.
	getErrorUrl (see page 638)	This is getErrorUrl, a member of class IScriptErrorList.
	getPerErrorDisplay (see page 638)	This is getPerErrorDisplay, a member of class IScriptErrorList.
	retreatError (see page 639)	This is retreatError, a member of class IScriptErrorList.
	setDetailsPaneOpen (see page 639)	This is setDetailsPaneOpen, a member of class IScriptErrorList.
	setPerErrorDisplay (see page 639)	This is setPerErrorDisplay, a member of class IScriptErrorList.

8.2.6.2.1 IScriptErrorList.advanceError Method

Pascal

```
procedure advanceError; safecall;
```

C++

```
__fastcall advanceError();
```

Description

This is advanceError, a member of class IScriptErrorList.

8.2.6.2.2 IScriptErrorList.canAdvanceError Method

Pascal

```
function canAdvanceError: Integer; safecall;
```

C++

```
__fastcall int canAdvanceError();
```

Description

This is canAdvanceError, a member of class IScriptErrorList.

8.2.6.2.3 IScriptErrorList.canRetreatError Method

Pascal

```
function canRetreatError: Integer; safecall;
```

C++

```
__fastcall int canRetreatError();
```

Description

This is canRetreatError, a member of class IScriptErrorList.

8.2.6.2.4 IScriptErrorList.getAlwaysShowLockState Method

Pascal

```
function getAlwaysShowLockState: Integer; safecall;
```

C++

```
__fastcall int getAlwaysShowLockState();
```

Description

This is getAlwaysShowLockState, a member of class IScriptErrorList.

8.2.6.2.5 IScriptErrorList.getDetailsPaneOpen Method

Pascal

```
function getDetailsPaneOpen: Integer; safecall;
```

C++

```
__fastcall int getDetailsPaneOpen();
```

Description

This is getDetailsPaneOpen, a member of class IScriptErrorList.

8.2.6.2.6 IScriptErrorList.getErrorChar Method

Pascal

```
function getErrorChar: Integer; safecall;
```

C++

```
__fastcall int getErrorChar();
```

Description

This is getErrorChar, a member of class IScriptErrorList.

8.2.6.2.7 IScriptErrorList.getErrorCode Method

Pascal

```
function getErrorCode: Integer; safecall;
```

C++

```
__fastcall int getErrorCode();
```

Description

This is getErrorCode, a member of class IScriptErrorList.

8.2.6.2.8 IScriptErrorList.getErrorLine Method

Pascal

```
function getErrorLine: Integer; safecall;
```

C++

```
__fastcall int getErrorLine();
```

Description

This is getErrorLine, a member of class IScriptErrorList.

8.2.6.2.9 IScriptErrorList.getErrorMsg Method

Pascal

```
function getErrorMsg: WideString; safecall;
```

C++

```
__fastcall BSTR getErrorMsg();
```

Description

This is getErrorMsg, a member of class IScriptErrorList.

8.2.6.2.10 IScriptErrorList.getErrorUrl Method

Pascal

```
function getErrorUrl: WideString; safecall;
```

C++

```
__fastcall BSTR getErrorUrl();
```

Description

This is getErrorUrl, a member of class IScriptErrorList.

8.2.6.2.11 IScriptErrorList.getPerErrorDisplay Method

Pascal

```
function getPerErrorDisplay: Integer; safecall;
```

C++

```
__fastcall int getPerErrorDisplay();
```

Description

This is getPerErrorDisplay, a member of class IScriptErrorList.

8.2.6.2.12 IScriptErrorList.retreatError Method

Pascal

```
procedure retreatError; safecall;
```

C++

```
__fastcall retreatError();
```

Description

This is retreatError, a member of class IScriptErrorList.

8.2.6.2.13 IScriptErrorList.setDetailsPaneOpen Method

Pascal

```
procedure setDetailsPaneOpen(fDetailsPaneOpen: Integer); safecall;
```

C++

```
__fastcall setDetailsPaneOpen(int fDetailsPaneOpen);
```

Description

This is setDetailsPaneOpen, a member of class IScriptErrorList.

8.2.6.2.14 IScriptErrorList.setPerErrorDisplay Method

Pascal

```
procedure setPerErrorDisplay(fPerErrorDisplay: Integer); safecall;
```

C++

```
__fastcall setPerErrorDisplay(int fPerErrorDisplay);
```

Description

This is setPerErrorDisplay, a member of class IScriptErrorList.

8.2.7 IScriptErrorListDisp Interface

Class Hierarchy

Pascal

```
IScriptErrorListDisp = dispinterface;
```

C++

```
class IScriptErrorListDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IScriptErrorListDisp.

8.2.7.1 IScriptErrorListDisp Members

The following tables list the members exposed by IScriptErrorListDisp.

Public Methods

	Name	Description
	advanceError (see page 640)	This is advanceError, a member of class IScriptErrorListDisp.
	canAdvanceError (see page 641)	This is canAdvanceError, a member of class IScriptErrorListDisp.
	canRetreatError (see page 641)	This is canRetreatError, a member of class IScriptErrorListDisp.
	getAlwaysShowLockState (see page 641)	This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.
	getDetailsPaneOpen (see page 641)	This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.
	getErrorChar (see page 642)	This is getErrorChar, a member of class IScriptErrorListDisp.
	getErrorCode (see page 642)	This is getErrorCode, a member of class IScriptErrorListDisp.
	getErrorLine (see page 642)	This is getErrorLine, a member of class IScriptErrorListDisp.
	getErrorMsg (see page 642)	This is getErrorMsg, a member of class IScriptErrorListDisp.
	getErrorUrl (see page 642)	This is getErrorUrl, a member of class IScriptErrorListDisp.
	getPerErrorDisplay (see page 643)	This is getPerErrorDisplay, a member of class IScriptErrorListDisp.
	retreatError (see page 643)	This is retreatError, a member of class IScriptErrorListDisp.
	setDetailsPaneOpen (see page 643)	This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.
	setPerErrorDisplay (see page 643)	This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

8.2.7.2 IScriptErrorListDisp Methods

The methods of the IScriptErrorListDisp class are listed here.

Public Methods

	Name	Description
	advanceError (see page 640)	This is advanceError, a member of class IScriptErrorListDisp.
	canAdvanceError (see page 641)	This is canAdvanceError, a member of class IScriptErrorListDisp.
	canRetreatError (see page 641)	This is canRetreatError, a member of class IScriptErrorListDisp.
	getAlwaysShowLockState (see page 641)	This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.
	getDetailsPaneOpen (see page 641)	This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.
	getErrorChar (see page 642)	This is getErrorChar, a member of class IScriptErrorListDisp.
	getErrorCode (see page 642)	This is getErrorCode, a member of class IScriptErrorListDisp.
	getErrorLine (see page 642)	This is getErrorLine, a member of class IScriptErrorListDisp.
	getErrorMsg (see page 642)	This is getErrorMsg, a member of class IScriptErrorListDisp.
	getErrorUrl (see page 642)	This is getErrorUrl, a member of class IScriptErrorListDisp.
	getPerErrorDisplay (see page 643)	This is getPerErrorDisplay, a member of class IScriptErrorListDisp.
	retreatError (see page 643)	This is retreatError, a member of class IScriptErrorListDisp.
	setDetailsPaneOpen (see page 643)	This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.
	setPerErrorDisplay (see page 643)	This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

8.2.7.2.1 IScriptErrorListDisp.advanceError Method

Pascal

```
procedure advanceError;
```

C++

```
__fastcall advanceError();
```

Description

This is advanceError, a member of class IScriptErrorListDisp.

8.2.7.2.2 IScriptErrorListDisp.canAdvanceError Method

Pascal

```
function canAdvanceError: Integer;
```

C++

```
__fastcall int canAdvanceError();
```

Description

This is canAdvanceError, a member of class IScriptErrorListDisp.

8.2.7.2.3 IScriptErrorListDisp.canRetreatError Method

Pascal

```
function canRetreatError: Integer;
```

C++

```
__fastcall int canRetreatError();
```

Description

This is canRetreatError, a member of class IScriptErrorListDisp.

8.2.7.2.4 IScriptErrorListDisp.getAlwaysShowLockState Method

Pascal

```
function getAlwaysShowLockState: Integer;
```

C++

```
__fastcall int getAlwaysShowLockState();
```

Description

This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.

8.2.7.2.5 IScriptErrorListDisp.getDetailsPaneOpen Method

Pascal

```
function getDetailsPaneOpen: Integer;
```

C++

```
__fastcall int getDetailsPaneOpen();
```

Description

This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.

8.2.7.2.6 IScriptErrorListDisp.getErrorChar Method

Pascal

```
function getErrorChar: Integer;
```

C++

```
__fastcall int getErrorChar();
```

Description

This is getErrorChar, a member of class IScriptErrorListDisp.

8.2.7.2.7 IScriptErrorListDisp.getErrorCode Method

Pascal

```
function getErrorCode: Integer;
```

C++

```
__fastcall int getErrorCode();
```

Description

This is getErrorCode, a member of class IScriptErrorListDisp.

8.2.7.2.8 IScriptErrorListDisp.getErrorLine Method

Pascal

```
function getErrorLine: Integer;
```

C++

```
__fastcall int getErrorLine();
```

Description

This is getErrorLine, a member of class IScriptErrorListDisp.

8.2.7.2.9 IScriptErrorListDisp.getErrorMsg Method

Pascal

```
function getErrorMsg: WideString;
```

C++

```
__fastcall BSTR getErrorMsg();
```

Description

This is getErrorMsg, a member of class IScriptErrorListDisp.

8.2.7.2.10 IScriptErrorListDisp.getErrorUrl Method

Pascal

```
function getErrorUrl: WideString;
```

C++

```
__fastcall BSTR getErrorUrl();
```

Description

This is getErrorUrl, a member of class IScriptErrorListDisp.

8.2.7.2.11 IScriptErrorListDisp.getPerErrorDisplay Method

Pascal

```
function getPerErrorDisplay: Integer;
```

C++

```
__fastcall int getPerErrorDisplay();
```

Description

This is getPerErrorDisplay, a member of class IScriptErrorListDisp.

8.2.7.2.12 IScriptErrorListDisp.retreatError Method

Pascal

```
procedure retreatError;
```

C++

```
__fastcall retreatError();
```

Description

This is retreatError, a member of class IScriptErrorListDisp.

8.2.7.2.13 IScriptErrorListDisp.setDetailsPaneOpen Method

Pascal

```
procedure setDetailsPaneOpen(fDetailsPaneOpen: Integer);
```

C++

```
__fastcall setDetailsPaneOpen(int fDetailsPaneOpen);
```

Description

This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.

8.2.7.2.14 IScriptErrorListDisp.setPerErrorDisplay Method

Pascal

```
procedure setPerErrorDisplay(fPerErrorDisplay: Integer);
```

C++

```
__fastcall setPerErrorDisplay(int fPerErrorDisplay);
```

Description

This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

8.2.8 ISearch Interface

Class Hierarchy

Pascal

```
ISearch = interface(IDispatch);
```

C++

```
__interface ISearch : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearch.

8.2.8.1 ISearch Members

The following tables list the members exposed by ISearch.

Public Methods

	Name	Description
	Get_Id (see page 645)	This is Get_Id, a member of class ISearch.
	Get_Title (see page 645)	This is Get_Title, a member of class ISearch.
	Get_URL (see page 645)	This is Get_URL, a member of class ISearch.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.

Public Properties

	Name	Description
R	Id (see page 645)	This is Id, a member of class ISearch.
R	Title (see page 646)	This is Title, a member of class ISearch.
R	URL (see page 646)	This is URL, a member of class ISearch.

8.2.8.2 ISearch Methods

The methods of the ISearch class are listed here.

Public Methods

	Name	Description
	Get_Id (see page 645)	This is Get_Id, a member of class ISearch.
	Get_Title (see page 645)	This is Get_Title, a member of class ISearch.
	Get_URL (see page 645)	This is Get_URL, a member of class ISearch.

8.2.8.2.1 ISearch.Get_Id Method

Pascal

```
function Get_Id: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Id();
```

Description

This is Get_Id, a member of class ISearch.

8.2.8.2.2 ISearch.Get_Title Method

Pascal

```
function Get_Title: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Title();
```

Description

This is Get_Title, a member of class ISearch.

8.2.8.2.3 ISearch.Get_URL Method

Pascal

```
function Get_URL: WideString; safecall;
```

C++

```
__fastcall BSTR Get_URL();
```

Description

This is Get_URL, a member of class ISearch.

8.2.8.3 ISearch Properties

The properties of the ISearch class are listed here.

Public Properties

	Name	Description
	Id (see page 645)	This is Id, a member of class ISearch.
	Title (see page 646)	This is Title, a member of class ISearch.
	URL (see page 646)	This is URL, a member of class ISearch.

8.2.8.3.1 ISearch.Id Property

Pascal

```
property Id: WideString;
```

C++

```
__property BSTR Id;
```

Description

This is Id, a member of class ISearch.

8.2.8.3.2 ISearch.Title Property

Pascal

```
property Title: WideString;
```

C++

```
__property BSTR Title;
```

Description

This is Title, a member of class ISearch.

8.2.8.3.3 ISearch.URL Property

Pascal

```
property URL: WideString;
```

C++

```
__property BSTR URL;
```

Description

This is URL, a member of class ISearch.

8.2.9 ISearchAssistantOC Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC = interface(IDispatch);
```

C++

```
__interface ISearchAssistantOC : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC.

8.2.9.1 ISearchAssistantOC Members

The following tables list the members exposed by ISearchAssistantOC.

Public Methods

	Name	Description
	AddNextMenuItem (see page 648)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 648)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 649)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 649)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 649)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 649)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 649)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 650)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 650)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 650)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 650)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 651)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 651)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_Version (see page 651)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetProperty (see page 651)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 651)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	IsRestricted (see page 652)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 652)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 652)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 652)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 653)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 653)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 653)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 653)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 653)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 654)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 654)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 654)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 655)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 655)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 655)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 655)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 656)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 656)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	Version (see page 656)	This is Version, a member of class ISearchAssistantOC.

8.2.9.2 ISearchAssistantOC Methods

The methods of the ISearchAssistantOC class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 648)	This is AddNextMenuItem, a member of class ISearchAssistantOC.

	EncodeString (see page 648)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 649)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 649)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 649)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 649)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 649)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 650)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 650)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 650)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 650)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 651)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 651)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_Version (see page 651)	This is Get_Version, a member of class ISearchAssistantOC.
	GetProperty (see page 651)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 651)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	IsRestricted (see page 652)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 652)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 652)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 652)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 653)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 653)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 653)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 653)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 653)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 654)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 654)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

8.2.9.2.1 ISearchAssistantOC.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer); safecall;
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC.

8.2.9.2.2 ISearchAssistantOC.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString; safecall;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC.

8.2.9.2.3 ISearchAssistantOC.FindComputer Method

Pascal

```
procedure FindComputer; safecall;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC.

8.2.9.2.4 ISearchAssistantOC.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders; safecall;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC.

8.2.9.2.5 ISearchAssistantOC.FindOnWeb Method

Pascal

```
procedure FindOnWeb; safecall;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC.

8.2.9.2.6 ISearchAssistantOC.FindPeople Method

Pascal

```
procedure FindPeople; safecall;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC.

8.2.9.2.7 ISearchAssistantOC.FindPrinter Method

Pascal

```
procedure FindPrinter; safecall;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC.

8.2.9.2.8 ISearchAssistantOC.Get_ASProvider Method

Pascal

```
function Get_ASProvider: WideString; safecall;
```

C++

```
__fastcall BSTR Get_ASProvider();
```

Description

This is Get_ASProvider, a member of class ISearchAssistantOC.

8.2.9.2.9 ISearchAssistantOC.Get_ASSetting Method

Pascal

```
function Get_ASSetting: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_ASSetting();
```

Description

This is Get_ASSetting, a member of class ISearchAssistantOC.

8.2.9.2.10 ISearchAssistantOC.Get_InWebFolder Method

Pascal

```
function Get_InWebFolder: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_InWebFolder();
```

Description

This is Get_InWebFolder, a member of class ISearchAssistantOC.

8.2.9.2.11 ISearchAssistantOC.Get_SearchAssistantDefault Method

Pascal

```
function Get_SearchAssistantDefault: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SearchAssistantDefault();
```

Description

This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.

8.2.9.2.12 ISearchAssistantOC.Get_Searches Method

Pascal

```
function Get_Searches: ISearches; safecall;
```

C++

```
__fastcall ISearches Get_Searches();
```

Description

This is Get_Searches, a member of class ISearchAssistantOC.

8.2.9.2.13 ISearchAssistantOC.Get_ShellFeaturesEnabled Method

Pascal

```
function Get_ShellFeaturesEnabled: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_ShellFeaturesEnabled();
```

Description

This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.

8.2.9.2.14 ISearchAssistantOC.Get_Version Method

Pascal

```
function Get_Version: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_Version();
```

Description

This is Get_Version, a member of class ISearchAssistantOC.

8.2.9.2.15 ISearchAssistantOC.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString; safecall;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC.

8.2.9.2.16 ISearchAssistantOC.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
safecall;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC.

8.2.9.2.17 ISearchAssistantOC.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool; safecall;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC.

8.2.9.2.18 ISearchAssistantOC.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch; safecall;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.

8.2.9.2.19 ISearchAssistantOC.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate; safecall;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC.

8.2.9.2.20 ISearchAssistantOC.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged; safecall;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.

8.2.9.2.21 ISearchAssistantOC.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString); safecall;
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC.

8.2.9.2.22 ISearchAssistantOC.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString); safecall;
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC.

8.2.9.2.23 ISearchAssistantOC.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu; safecall;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC.

8.2.9.2.24 ISearchAssistantOC.Set_ASProvider Method

Pascal

```
procedure Set_ASProvider(const pProvider: WideString); safecall;
```

C++

```
__fastcall Set_ASProvider(const BSTR pProvider);
```

Description

This is Set_ASProvider, a member of class ISearchAssistantOC.

8.2.9.2.25 ISearchAssistantOC.Set_ASSetting Method

Pascal

```
procedure Set_ASSetting(pSetting: SYSINT); safecall;
```

C++

```
__fastcall Set_ASSetting(SYSINT pSetting);
```

Description

This is Set_ASSetting, a member of class ISearchAssistantOC.

8.2.9.2.26 ISearchAssistantOC.Set_EventHandled Method

Pascal

```
procedure Set_EventHandled(Param1: WordBool); safecall;
```

C++

```
__fastcall Set_EventHandled(WordBool Param1);
```

Description

This is Set_EventHandled, a member of class ISearchAssistantOC.

8.2.9.2.27 ISearchAssistantOC.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString); safecall;
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

8.2.9.3 ISearchAssistantOC Properties

The properties of the ISearchAssistantOC class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 654)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 655)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 655)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 655)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 655)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 656)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 656)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	Version (see page 656)	This is Version, a member of class ISearchAssistantOC.

8.2.9.3.1 ISearchAssistantOC.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC.

8.2.9.3.2 ISearchAssistantOC.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC.

8.2.9.3.3 ISearchAssistantOC.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC.

8.2.9.3.4 ISearchAssistantOC.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC.

8.2.9.3.5 ISearchAssistantOC.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC.

8.2.9.3.6 ISearchAssistantOC.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC.

8.2.9.3.7 ISearchAssistantOC.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.

8.2.9.3.8 ISearchAssistantOC.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC.

8.2.10 ISearchAssistantOC2 Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC2 = interface(ISearchAssistantOC);
```

C++

```
__interface ISearchAssistantOC2 : public ISearchAssistantOC;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC2.

8.2.10.1 ISearchAssistantOC2 Members

The following tables list the members exposed by ISearchAssistantOC2.

Public Methods

	Name	Description
	AddNextMenuItem (see page 648)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 648)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 649)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 649)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 649)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 649)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 649)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 650)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 650)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 650)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 650)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 651)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 651)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_ShowFindPrinter (see page 658)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.
	Get_Version (see page 651)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetProperty (see page 651)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 651)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	IsRestricted (see page 652)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 652)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 652)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 652)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 653)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 653)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 653)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 653)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 653)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 654)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 654)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 654)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 655)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 655)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 655)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 655)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 656)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 656)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	ShowFindPrinter (see page 658)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.
R	Version (see page 656)	This is Version, a member of class ISearchAssistantOC.

8.2.10.2 ISearchAssistantOC2 Methods

The methods of the ISearchAssistantOC2 class are listed here.

Public Methods

	Name	Description
	Get_ShowFindPrinter (see page 658)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.

8.2.10.2.1 ISearchAssistantOC2.Get_ShowFindPrinter Method

Pascal

```
function Get_ShowFindPrinter: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_ShowFindPrinter();
```

Description

This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.

8.2.10.3 ISearchAssistantOC2 Properties

The properties of the ISearchAssistantOC2 class are listed here.

Public Properties

	Name	Description
	ShowFindPrinter (see page 658)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.

8.2.10.3.1 ISearchAssistantOC2.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC2.

8.2.11 ISearchAssistantOC2Disp Interface

Class Hierarchy

SHDocVw.ISearchAssistantOC2Disp

Pascal

```
ISearchAssistantOC2Disp = dispinterface;
```

C++

```
class ISearchAssistantOC2Disp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC2Disp.

8.2.11.1 ISearchAssistantOC2Disp Members

The following tables list the members exposed by ISearchAssistantOC2Disp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 660)	This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.
	EncodeString (see page 660)	This is EncodeString, a member of class ISearchAssistantOC2Disp.
	FindComputer (see page 660)	This is FindComputer, a member of class ISearchAssistantOC2Disp.
	FindFilesOrFolders (see page 661)	This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.
	FindOnWeb (see page 661)	This is FindOnWeb, a member of class ISearchAssistantOC2Disp.
	FindPeople (see page 661)	This is FindPeople, a member of class ISearchAssistantOC2Disp.
	FindPrinter (see page 661)	This is FindPrinter, a member of class ISearchAssistantOC2Disp.
	GetProperty (see page 662)	This is GetProperty, a member of class ISearchAssistantOC2Disp.
	GetSearchAssistantURL (see page 662)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.
	IsRestricted (see page 662)	This is IsRestricted, a member of class ISearchAssistantOC2Disp.
	NavigateToDefaultSearch (see page 662)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.
	NETDetectNextNavigate (see page 662)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.
	NotifySearchSettingsChanged (see page 663)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.
	PutFindText (see page 663)	This is PutFindText, a member of class ISearchAssistantOC2Disp.
	PutProperty (see page 663)	This is PutProperty, a member of class ISearchAssistantOC2Disp.
	ResetNextMenu (see page 663)	This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.
	SetDefaultSearchUrl (see page 664)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

Public Properties

	Name	Description
	ASProvider (see page 664)	This is ASProvider, a member of class ISearchAssistantOC2Disp.
	ASSetting (see page 664)	This is ASSetting, a member of class ISearchAssistantOC2Disp.
	EventHandled (see page 665)	This is EventHandled, a member of class ISearchAssistantOC2Disp.
	InWebFolder (see page 665)	This is InWebFolder, a member of class ISearchAssistantOC2Disp.
	SearchAssistantDefault (see page 665)	This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.
	Searches (see page 665)	This is Searches, a member of class ISearchAssistantOC2Disp.
	ShellFeaturesEnabled (see page 665)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.
	ShowFindPrinter (see page 666)	This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.
	Version (see page 666)	This is Version, a member of class ISearchAssistantOC2Disp.

8.2.11.2 ISearchAssistantOC2Disp Methods

The methods of the ISearchAssistantOC2Disp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 660)	This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.
	EncodeString (see page 660)	This is EncodeString, a member of class ISearchAssistantOC2Disp.
	FindComputer (see page 660)	This is FindComputer, a member of class ISearchAssistantOC2Disp.
	FindFilesOrFolders (see page 661)	This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.
	FindOnWeb (see page 661)	This is FindOnWeb, a member of class ISearchAssistantOC2Disp.
	FindPeople (see page 661)	This is FindPeople, a member of class ISearchAssistantOC2Disp.
	FindPrinter (see page 661)	This is FindPrinter, a member of class ISearchAssistantOC2Disp.
	GetProperty (see page 662)	This is GetProperty, a member of class ISearchAssistantOC2Disp.
	GetSearchAssistantURL (see page 662)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.
	IsRestricted (see page 662)	This is IsRestricted, a member of class ISearchAssistantOC2Disp.
	NavigateToDefaultSearch (see page 662)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.
	NETDetectNextNavigate (see page 662)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.
	NotifySearchSettingsChanged (see page 663)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.
	PutFindText (see page 663)	This is PutFindText, a member of class ISearchAssistantOC2Disp.
	PutProperty (see page 663)	This is PutProperty, a member of class ISearchAssistantOC2Disp.
	ResetNextMenu (see page 663)	This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.
	SetDefaultSearchUrl (see page 664)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

8.2.11.2.1 ISearchAssistantOC2Disp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.

8.2.11.2.2 ISearchAssistantOC2Disp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC2Disp.

8.2.11.2.3 ISearchAssistantOC2Disp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC2Disp.

8.2.11.2.4 ISearchAssistantOC2Disp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.

8.2.11.2.5 ISearchAssistantOC2Disp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC2Disp.

8.2.11.2.6 ISearchAssistantOC2Disp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC2Disp.

8.2.11.2.7 ISearchAssistantOC2Disp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC2Disp.

8.2.11.2.8 ISearchAssistantOC2Disp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC2Disp.

8.2.11.2.9 ISearchAssistantOC2Disp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.

8.2.11.2.10 ISearchAssistantOC2Disp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC2Disp.

8.2.11.2.11 ISearchAssistantOC2Disp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.

8.2.11.2.12 ISearchAssistantOC2Disp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.

8.2.11.2.13 ISearchAssistantOC2Disp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.

8.2.11.2.14 ISearchAssistantOC2Disp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC2Disp.

8.2.11.2.15 ISearchAssistantOC2Disp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC2Disp.

8.2.11.2.16 ISearchAssistantOC2Disp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.

8.2.11.2.17 ISearchAssistantOC2Disp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

8.2.11.3 ISearchAssistantOC2Disp Properties

The properties of the ISearchAssistantOC2Disp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 664)	This is ASProvider, a member of class ISearchAssistantOC2Disp.
	ASSetting (see page 664)	This is ASSetting, a member of class ISearchAssistantOC2Disp.
	EventHandled (see page 665)	This is EventHandled, a member of class ISearchAssistantOC2Disp.
	InWebFolder (see page 665)	This is InWebFolder, a member of class ISearchAssistantOC2Disp.
	SearchAssistantDefault (see page 665)	This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.
	Searches (see page 665)	This is Searches, a member of class ISearchAssistantOC2Disp.
	ShellFeaturesEnabled (see page 665)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.
	ShowFindPrinter (see page 666)	This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.
	Version (see page 666)	This is Version, a member of class ISearchAssistantOC2Disp.

8.2.11.3.1 ISearchAssistantOC2Disp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC2Disp.

8.2.11.3.2 ISearchAssistantOC2Disp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC2Disp.

8.2.11.3.3 ISearchAssistantOC2Disp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC2Disp.

8.2.11.3.4 ISearchAssistantOC2Disp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC2Disp.

8.2.11.3.5 ISearchAssistantOC2Disp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.

8.2.11.3.6 ISearchAssistantOC2Disp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC2Disp.

8.2.11.3.7 ISearchAssistantOC2Disp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.

8.2.11.3.8 ISearchAssistantOC2Disp.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.

8.2.11.3.9 ISearchAssistantOC2Disp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC2Disp.

8.2.12 ISearchAssistantOC3 Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC3 = interface(ISearchAssistantOC2);
```

C++

```
__interface ISearchAssistantOC3 : public ISearchAssistantOC2;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC3.

8.2.12.1 ISearchAssistantOC3 Members

The following tables list the members exposed by ISearchAssistantOC3.

Public Methods

	Name	Description
	AddNextMenuItem (see page 648)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 648)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 649)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 649)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 649)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 649)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 649)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 650)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 650)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 650)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 650)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_SearchCompanionAvailable (see page 668)	This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	Get_Searches (see page 651)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 651)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_ShowFindPrinter (see page 658)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.
	Get_UseSearchCompanion (see page 668)	This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.
	Get_Version (see page 651)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetProperty (see page 651)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 651)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	IsRestricted (see page 652)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 652)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 652)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 652)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 653)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 653)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 653)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 653)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 653)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 654)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	Set_UseSearchCompanion (see page 668)	This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.
	SetDefaultSearchUrl (see page 654)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 654)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 655)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 655)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 655)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 655)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	SearchCompanionAvailable (see page 669)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.
R	Searches (see page 656)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 656)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	ShowFindPrinter (see page 658)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.
	UseSearchCompanion (see page 669)	This is UseSearchCompanion, a member of class ISearchAssistantOC3.
R	Version (see page 656)	This is Version, a member of class ISearchAssistantOC.

8.2.12.2 ISearchAssistantOC3 Methods

The methods of the ISearchAssistantOC3 class are listed here.

Public Methods

	Name	Description
	Get_SearchCompanionAvailable (see page 668)	This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	Get_UseSearchCompanion (see page 668)	This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.
	Set_UseSearchCompanion (see page 668)	This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.

8.2.12.2.1 ISearchAssistantOC3.Get_SearchCompanionAvailable Method

Pascal

```
function Get_SearchCompanionAvailable: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SearchCompanionAvailable();
```

Description

This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.

8.2.12.2.2 ISearchAssistantOC3.Get_UseSearchCompanion Method

Pascal

```
function Get_UseSearchCompanion: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_UseSearchCompanion();
```

Description

This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.

8.2.12.2.3 ISearchAssistantOC3.Set_UseSearchCompanion Method

Pascal

```
procedure Set_UseSearchCompanion(pbUseSC: WordBool); safecall;
```

C++

```
__fastcall Set_UseSearchCompanion(WordBool pbUseSC);
```

Description

This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.

8.2.12.3 ISearchAssistantOC3 Properties

The properties of the ISearchAssistantOC3 class are listed here.

Public Properties

	Name	Description
	SearchCompanionAvailable (see page 669)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	UseSearchCompanion (see page 669)	This is UseSearchCompanion, a member of class ISearchAssistantOC3.

8.2.12.3.1 ISearchAssistantOC3.SearchCompanionAvailable Property

Pascal

```
property SearchCompanionAvailable: WordBool;
```

C++

```
__property WordBool SearchCompanionAvailable;
```

Description

This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.

8.2.12.3.2 ISearchAssistantOC3.UseSearchCompanion Property

Pascal

```
property UseSearchCompanion: WordBool;
```

C++

```
__property WordBool UseSearchCompanion;
```

Description

This is UseSearchCompanion, a member of class ISearchAssistantOC3.

8.2.13 ISearchAssistantOC3Disp Interface

Class Hierarchy

SHDocVw.ISearchAssistantOC3Disp

Pascal

```
ISearchAssistantOC3Disp = dispinterface;
```

C++

```
class ISearchAssistantOC3Disp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC3Disp.

8.2.13.1 ISearchAssistantOC3Disp Members

The following tables list the members exposed by ISearchAssistantOC3Disp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 671)	This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.
	EncodeString (see page 671)	This is EncodeString, a member of class ISearchAssistantOC3Disp.
	FindComputer (see page 671)	This is FindComputer, a member of class ISearchAssistantOC3Disp.
	FindFilesOrFolders (see page 671)	This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.
	FindOnWeb (see page 672)	This is FindOnWeb, a member of class ISearchAssistantOC3Disp.
	FindPeople (see page 672)	This is FindPeople, a member of class ISearchAssistantOC3Disp.
	FindPrinter (see page 672)	This is FindPrinter, a member of class ISearchAssistantOC3Disp.
	GetProperty (see page 672)	This is GetProperty, a member of class ISearchAssistantOC3Disp.
	GetSearchAssistantURL (see page 672)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.
	IsRestricted (see page 673)	This is IsRestricted, a member of class ISearchAssistantOC3Disp.
	NavigateToDefaultSearch (see page 673)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.
	NETDetectNextNavigate (see page 673)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.
	NotifySearchSettingsChanged (see page 673)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.
	PutFindText (see page 674)	This is PutFindText, a member of class ISearchAssistantOC3Disp.
	PutProperty (see page 674)	This is PutProperty, a member of class ISearchAssistantOC3Disp.
	ResetNextMenu (see page 674)	This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.
	SetDefaultSearchUrl (see page 674)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

Public Properties

	Name	Description
	ASProvider (see page 675)	This is ASProvider, a member of class ISearchAssistantOC3Disp.
	ASSetting (see page 675)	This is ASSetting, a member of class ISearchAssistantOC3Disp.
	EventHandled (see page 675)	This is EventHandled, a member of class ISearchAssistantOC3Disp.
	InWebFolder (see page 676)	This is InWebFolder, a member of class ISearchAssistantOC3Disp.
	SearchAssistantDefault (see page 676)	This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.
	SearchCompanionAvailable (see page 676)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.
	Searches (see page 676)	This is Searches, a member of class ISearchAssistantOC3Disp.
	ShellFeaturesEnabled (see page 676)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.
	ShowFindPrinter (see page 677)	This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.
	UseSearchCompanion (see page 677)	This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.
	Version (see page 677)	This is Version, a member of class ISearchAssistantOC3Disp.

8.2.13.2 ISearchAssistantOC3Disp Methods

The methods of the ISearchAssistantOC3Disp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 671)	This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.
	EncodeString (see page 671)	This is EncodeString, a member of class ISearchAssistantOC3Disp.
	FindComputer (see page 671)	This is FindComputer, a member of class ISearchAssistantOC3Disp.
	FindFilesOrFolders (see page 671)	This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.
	FindOnWeb (see page 672)	This is FindOnWeb, a member of class ISearchAssistantOC3Disp.
	FindPeople (see page 672)	This is FindPeople, a member of class ISearchAssistantOC3Disp.
	FindPrinter (see page 672)	This is FindPrinter, a member of class ISearchAssistantOC3Disp.
	GetProperty (see page 672)	This is GetProperty, a member of class ISearchAssistantOC3Disp.
	GetSearchAssistantURL (see page 672)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.
	IsRestricted (see page 673)	This is IsRestricted, a member of class ISearchAssistantOC3Disp.
	NavigateToDefaultSearch (see page 673)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.

	NETDetectNextNavigate (see page 673)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.
	NotifySearchSettingsChanged (see page 673)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.
	PutFindText (see page 674)	This is PutFindText, a member of class ISearchAssistantOC3Disp.
	PutProperty (see page 674)	This is PutProperty, a member of class ISearchAssistantOC3Disp.
	ResetNextMenu (see page 674)	This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.
	SetDefaultSearchUrl (see page 674)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

8.2.13.2.1 ISearchAssistantOC3Disp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.

8.2.13.2.2 ISearchAssistantOC3Disp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC3Disp.

8.2.13.2.3 ISearchAssistantOC3Disp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC3Disp.

8.2.13.2.4 ISearchAssistantOC3Disp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.

8.2.13.2.5 ISearchAssistantOC3Disp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC3Disp.

8.2.13.2.6 ISearchAssistantOC3Disp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC3Disp.

8.2.13.2.7 ISearchAssistantOC3Disp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC3Disp.

8.2.13.2.8 ISearchAssistantOC3Disp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC3Disp.

8.2.13.2.9 ISearchAssistantOC3Disp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.

8.2.13.2.10 ISearchAssistantOC3Disp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC3Disp.

8.2.13.2.11 ISearchAssistantOC3Disp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.

8.2.13.2.12 ISearchAssistantOC3Disp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.

8.2.13.2.13 ISearchAssistantOC3Disp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.

8.2.13.2.14 ISearchAssistantOC3Disp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC3Disp.

8.2.13.2.15 ISearchAssistantOC3Disp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC3Disp.

8.2.13.2.16 ISearchAssistantOC3Disp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.

8.2.13.2.17 ISearchAssistantOC3Disp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

8.2.13.3 ISearchAssistantOC3Disp Properties

The properties of the ISearchAssistantOC3Disp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 675)	This is ASProvider, a member of class ISearchAssistantOC3Disp.
	ASSetting (see page 675)	This is ASSetting, a member of class ISearchAssistantOC3Disp.
	EventHandled (see page 675)	This is EventHandled, a member of class ISearchAssistantOC3Disp.
	InWebFolder (see page 676)	This is InWebFolder, a member of class ISearchAssistantOC3Disp.
	SearchAssistantDefault (see page 676)	This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.
	SearchCompanionAvailable (see page 676)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.
	Searches (see page 676)	This is Searches, a member of class ISearchAssistantOC3Disp.
	ShellFeaturesEnabled (see page 676)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.
	ShowFindPrinter (see page 677)	This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.
	UseSearchCompanion (see page 677)	This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.
	Version (see page 677)	This is Version, a member of class ISearchAssistantOC3Disp.

8.2.13.3.1 ISearchAssistantOC3Disp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC3Disp.

8.2.13.3.2 ISearchAssistantOC3Disp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC3Disp.

8.2.13.3.3 ISearchAssistantOC3Disp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC3Disp.

8.2.13.3.4 ISearchAssistantOC3Disp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC3Disp.

8.2.13.3.5 ISearchAssistantOC3Disp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.

8.2.13.3.6 ISearchAssistantOC3Disp.SearchCompanionAvailable Property

Pascal

```
property SearchCompanionAvailable: WordBool;
```

C++

```
__property WordBool SearchCompanionAvailable;
```

Description

This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.

8.2.13.3.7 ISearchAssistantOC3Disp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC3Disp.

8.2.13.3.8 ISearchAssistantOC3Disp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.

8.2.13.3.9 ISearchAssistantOC3Disp.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.

8.2.13.3.10 ISearchAssistantOC3Disp.UseSearchCompanion Property

Pascal

```
property UseSearchCompanion: WordBool;
```

C++

```
__property WordBool UseSearchCompanion;
```

Description

This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.

8.2.13.3.11 ISearchAssistantOC3Disp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC3Disp.

8.2.14 ISearchAssistantOCDisp Interface

Class Hierarchy

Pascal

```
ISearchAssistantOCDisp = dispinterface;
```

C++

```
class ISearchAssistantOCDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOCDisp.

8.2.14.1 ISearchAssistantOCDisp Members

The following tables list the members exposed by ISearchAssistantOCDisp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 679)	This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.
	EncodeString (see page 679)	This is EncodeString, a member of class ISearchAssistantOCDisp.
	FindComputer (see page 679)	This is FindComputer, a member of class ISearchAssistantOCDisp.
	FindFilesOrFolders (see page 679)	This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.
	FindOnWeb (see page 680)	This is FindOnWeb, a member of class ISearchAssistantOCDisp.
	FindPeople (see page 680)	This is FindPeople, a member of class ISearchAssistantOCDisp.
	FindPrinter (see page 680)	This is FindPrinter, a member of class ISearchAssistantOCDisp.
	GetProperty (see page 680)	This is GetProperty, a member of class ISearchAssistantOCDisp.
	GetSearchAssistantURL (see page 681)	This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.
	IsRestricted (see page 681)	This is IsRestricted, a member of class ISearchAssistantOCDisp.
	NavigateToDefaultSearch (see page 681)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.
	NETDetectNextNavigate (see page 681)	This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.
	NotifySearchSettingsChanged (see page 681)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.
	PutFindText (see page 682)	This is PutFindText, a member of class ISearchAssistantOCDisp.
	PutProperty (see page 682)	This is PutProperty, a member of class ISearchAssistantOCDisp.
	ResetNextMenu (see page 682)	This is ResetNextMenu, a member of class ISearchAssistantOCDisp.
	SetDefaultSearchUrl (see page 682)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

Public Properties

	Name	Description
	ASProvider (see page 683)	This is ASProvider, a member of class ISearchAssistantOCDisp.
	ASSetting (see page 683)	This is ASSetting, a member of class ISearchAssistantOCDisp.
	EventHandled (see page 683)	This is EventHandled, a member of class ISearchAssistantOCDisp.
	InWebFolder (see page 684)	This is InWebFolder, a member of class ISearchAssistantOCDisp.
	SearchAssistantDefault (see page 684)	This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.
	Searches (see page 684)	This is Searches, a member of class ISearchAssistantOCDisp.
	ShellFeaturesEnabled (see page 684)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.
	Version (see page 684)	This is Version, a member of class ISearchAssistantOCDisp.

8.2.14.2 ISearchAssistantOCDisp Methods

The methods of the ISearchAssistantOCDisp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 679)	This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.
	EncodeString (see page 679)	This is EncodeString, a member of class ISearchAssistantOCDisp.
	FindComputer (see page 679)	This is FindComputer, a member of class ISearchAssistantOCDisp.
	FindFilesOrFolders (see page 679)	This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.
	FindOnWeb (see page 680)	This is FindOnWeb, a member of class ISearchAssistantOCDisp.
	FindPeople (see page 680)	This is FindPeople, a member of class ISearchAssistantOCDisp.

	FindPrinter (see page 680)	This is FindPrinter, a member of class ISearchAssistantOCDisp.
	GetProperty (see page 680)	This is GetProperty, a member of class ISearchAssistantOCDisp.
	GetSearchAssistantURL (see page 681)	This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.
	IsRestricted (see page 681)	This is IsRestricted, a member of class ISearchAssistantOCDisp.
	NavigateToDefaultSearch (see page 681)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.
	NETDetectNextNavigate (see page 681)	This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.
	NotifySearchSettingsChanged (see page 681)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.
	PutFindText (see page 682)	This is PutFindText, a member of class ISearchAssistantOCDisp.
	PutProperty (see page 682)	This is PutProperty, a member of class ISearchAssistantOCDisp.
	ResetNextMenu (see page 682)	This is ResetNextMenu, a member of class ISearchAssistantOCDisp.
	SetDefaultSearchUrl (see page 682)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

8.2.14.2.1 ISearchAssistantOCDisp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.

8.2.14.2.2 ISearchAssistantOCDisp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOCDisp.

8.2.14.2.3 ISearchAssistantOCDisp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOCDisp.

8.2.14.2.4 ISearchAssistantOCDisp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.

8.2.14.2.5 ISearchAssistantOCDisp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOCDisp.

8.2.14.2.6 ISearchAssistantOCDisp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOCDisp.

8.2.14.2.7 ISearchAssistantOCDisp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOCDisp.

8.2.14.2.8 ISearchAssistantOCDisp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOCDisp.

8.2.14.2.9 ISearchAssistantOCDisp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.

8.2.14.2.10 ISearchAssistantOCDisp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOCDisp.

8.2.14.2.11 ISearchAssistantOCDisp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.

8.2.14.2.12 ISearchAssistantOCDisp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.

8.2.14.2.13 ISearchAssistantOCDisp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.

8.2.14.2.14 ISearchAssistantOCDisp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOCDisp.

8.2.14.2.15 ISearchAssistantOCDisp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOCDisp.

8.2.14.2.16 ISearchAssistantOCDisp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOCDisp.

8.2.14.2.17 ISearchAssistantOCDisp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

8.2.14.3 ISearchAssistantOCDisp Properties

The properties of the ISearchAssistantOCDisp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 683)	This is ASProvider, a member of class ISearchAssistantOCDisp.
	ASSetting (see page 683)	This is ASSetting, a member of class ISearchAssistantOCDisp.
	EventHandled (see page 683)	This is EventHandled, a member of class ISearchAssistantOCDisp.
	InWebFolder (see page 684)	This is InWebFolder, a member of class ISearchAssistantOCDisp.
	SearchAssistantDefault (see page 684)	This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.
	Searches (see page 684)	This is Searches, a member of class ISearchAssistantOCDisp.
	ShellFeaturesEnabled (see page 684)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.
	Version (see page 684)	This is Version, a member of class ISearchAssistantOCDisp.

8.2.14.3.1 ISearchAssistantOCDisp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOCDisp.

8.2.14.3.2 ISearchAssistantOCDisp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOCDisp.

8.2.14.3.3 ISearchAssistantOCDisp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOCDisp.

8.2.14.3.4 ISearchAssistantOCDisp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOCDisp.

8.2.14.3.5 ISearchAssistantOCDisp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.

8.2.14.3.6 ISearchAssistantOCDisp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOCDisp.

8.2.14.3.7 ISearchAssistantOCDisp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.

8.2.14.3.8 ISearchAssistantOCDisp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOCDisp.

8.2.15 ISearchDisp Interface

Class Hierarchy

Pascal

```
ISearchDisp = dispinterface;
```

C++

```
class ISearchDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchDisp.

8.2.15.1 ISearchDisp Members

The following tables list the members exposed by ISearchDisp.

Public Properties

	Name	Description
	Id (see page 685)	This is Id, a member of class ISearchDisp.
	Title (see page 686)	This is Title, a member of class ISearchDisp.
	URL (see page 686)	This is URL, a member of class ISearchDisp.

8.2.15.2 ISearchDisp Properties

The properties of the ISearchDisp class are listed here.

Public Properties

	Name	Description
	Id (see page 685)	This is Id, a member of class ISearchDisp.
	Title (see page 686)	This is Title, a member of class ISearchDisp.
	URL (see page 686)	This is URL, a member of class ISearchDisp.

8.2.15.2.1 ISearchDisp.Id Property

Pascal

```
property Id: WideString;
```

C++

```
__property BSTR Id;
```

Description

This is Id, a member of class ISearchDisp.

8.2.15.2.2 ISearchDisp.Title Property

Pascal

```
property Title: WideString;
```

C++

```
__property BSTR Title;
```

Description

This is Title, a member of class ISearchDisp.

8.2.15.2.3 ISearchDisp.URL Property

Pascal

```
property URL: WideString;
```

C++

```
__property BSTR URL;
```

Description

This is URL, a member of class ISearchDisp.

8.2.16 ISearches Interface

Class Hierarchy

Pascal

```
ISearches = interface(IDispatch);
```

C++

```
__interface ISearches : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearches.

8.2.16.1 ISearches Members

The following tables list the members exposed by ISearches.

Public Methods

	Name	Description
	_NewEnum (see page 687)	This is _NewEnum, a member of class ISearches.
	Get_Count (see page 687)	This is Get_Count, a member of class ISearches.
	Get_Default (see page 688)	This is Get_Default, a member of class ISearches.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	Item (see page 688)	This is Item, a member of class ISearches.

Public Properties

	Name	Description
R	Count (see page 688)	This is Count, a member of class ISearches.
R	Default (see page 688)	This is Default, a member of class ISearches.

8.2.16.2 ISearches Methods

The methods of the ISearches class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 687)	This is _NewEnum, a member of class ISearches.
	Get_Count (see page 687)	This is Get_Count, a member of class ISearches.
	Get_Default (see page 688)	This is Get_Default, a member of class ISearches.
	Item (see page 688)	This is Item, a member of class ISearches.

8.2.16.2.1 ISearches._NewEnum Method

Pascal

```
function _NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class ISearches.

8.2.16.2.2 ISearches.Get_Count Method

Pascal

```
function Get_Count: Integer; safecall;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class ISearches.

8.2.16.2.3 ISearches.Get_Default Method

Pascal

```
function Get_Default: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Default();
```

Description

This is Get_Default, a member of class ISearches.

8.2.16.2.4 ISearches.Item Method

Pascal

```
function Item(index: OleVariant): ISearch; safecall;
```

C++

```
__fastcall ISearch Item(OleVariant index);
```

Description

This is Item, a member of class ISearches.

8.2.16.3 ISearches Properties

The properties of the ISearches class are listed here.

Public Properties

	Name	Description
	Count (see page 688)	This is Count, a member of class ISearches.
	Default (see page 688)	This is Default, a member of class ISearches.

8.2.16.3.1 ISearches.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class ISearches.

8.2.16.3.2 ISearches.Default Property

Pascal

```
property Default: WideString;
```

C++

```
__property BSTR Default;
```

Description

This is Default, a member of class ISearches.

8.2.17 ISearchesDisp Interface

Class Hierarchy

Pascal

```
ISearchesDisp = dispinterface;
```

C++

```
class ISearchesDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchesDisp.

8.2.17.1 ISearchesDisp Members

The following tables list the members exposed by ISearchesDisp.

Public Methods

	Name	Description
	_NewEnum (see page 689)	This is _NewEnum, a member of class ISearchesDisp.
	Item (see page 690)	This is Item, a member of class ISearchesDisp.

Public Properties

	Name	Description
	Count (see page 690)	This is Count, a member of class ISearchesDisp.
	Default (see page 690)	This is Default, a member of class ISearchesDisp.

8.2.17.2 ISearchesDisp Methods

The methods of the ISearchesDisp class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 689)	This is _NewEnum, a member of class ISearchesDisp.
	Item (see page 690)	This is Item, a member of class ISearchesDisp.

8.2.17.2.1 ISearchesDisp._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class ISearchesDisp.

8.2.17.2.2 ISearchesDisp.Item Method

Pascal

```
function Item(index: OleVariant): ISearch;
```

C++

```
__fastcall ISearch Item(OleVariant index);
```

Description

This is Item, a member of class ISearchesDisp.

8.2.17.3 ISearchesDisp Properties

The properties of the ISearchesDisp class are listed here.

Public Properties

	Name	Description
	Count (see page 690)	This is Count, a member of class ISearchesDisp.
	Default (see page 690)	This is Default, a member of class ISearchesDisp.

8.2.17.3.1 ISearchesDisp.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class ISearchesDisp.

8.2.17.3.2 ISearchesDisp.Default Property

Pascal

```
property Default: WideString;
```

C++

```
__property BSTR Default;
```

Description

This is Default, a member of class ISearchesDisp.

8.2.18 IShellFavoritesNameSpace Interface

Class Hierarchy

Pascal

```
IShellFavoritesNameSpace = interface(IDispatch);
```

C++

```
__interface IShellFavoritesNameSpace : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellFavoritesNameSpace.

8.2.18.1 IShellFavoritesNameSpace Members

The following tables list the members exposed by IShellFavoritesNameSpace.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 692)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 692)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Export (see page 692)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_SubscriptionsEnabled (see page 693)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Import (see page 693)	This is Import, a member of class IShellFavoritesNameSpace.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	InvokeContextMenuCommand (see page 693)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 693)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 694)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 694)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 694)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 694)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SetRoot (see page 694)	This is SetRoot, a member of class IShellFavoritesNameSpace.
	Synchronize (see page 695)	This is Synchronize, a member of class IShellFavoritesNameSpace.

Public Properties

	Name	Description
R	SubscriptionsEnabled (see page 695)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

8.2.18.2 IShellFavoritesNameSpace Methods

The methods of the IShellFavoritesNameSpace class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 692)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 692)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Export (see page 692)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_SubscriptionsEnabled (see page 693)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	Import (see page 693)	This is Import, a member of class IShellFavoritesNameSpace.
	InvokeContextMenuCommand (see page 693)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 693)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 694)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 694)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 694)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 694)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SetRoot (see page 694)	This is SetRoot, a member of class IShellFavoritesNameSpace.
	Synchronize (see page 695)	This is Synchronize, a member of class IShellFavoritesNameSpace.

8.2.18.2.1 IShellFavoritesNameSpace.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool; safecall;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.

8.2.18.2.2 IShellFavoritesNameSpace.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool; safecall;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.

8.2.18.2.3 IShellFavoritesNameSpace.Export Method

Pascal

```
procedure Export; safecall;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellFavoritesNameSpace.

8.2.18.2.4 IShellFavoritesNameSpace.Get_SubscriptionsEnabled Method

Pascal

```
function Get_SubscriptionsEnabled: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SubscriptionsEnabled();
```

Description

This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

8.2.18.2.5 IShellFavoritesNameSpace.Import Method

Pascal

```
procedure Import; safecall;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellFavoritesNameSpace.

8.2.18.2.6 IShellFavoritesNameSpace.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString); safecall;
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.

8.2.18.2.7 IShellFavoritesNameSpace.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown; safecall;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.

8.2.18.2.8 IShellFavoritesNameSpace.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo; safecall;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.

8.2.18.2.9 IShellFavoritesNameSpace.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp; safecall;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.

8.2.18.2.10 IShellFavoritesNameSpace.NewFolder Method

Pascal

```
procedure NewFolder; safecall;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellFavoritesNameSpace.

8.2.18.2.11 IShellFavoritesNameSpace.ResetSort Method

Pascal

```
procedure ResetSort; safecall;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellFavoritesNameSpace.

8.2.18.2.12 IShellFavoritesNameSpace.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString); safecall;
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellFavoritesNameSpace.

8.2.18.2.13 IShellFavoritesNameSpace.Synchronize Method

Pascal

```
procedure Synchronize; safecall;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellFavoritesNameSpace.

8.2.18.3 IShellFavoritesNameSpace Properties

The properties of the IShellFavoritesNameSpace class are listed here.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 695)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

8.2.18.3.1 IShellFavoritesNameSpace.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

8.2.19 IShellFavoritesNameSpaceDisp Interface

Class Hierarchy

Pascal

```
IShellFavoritesNameSpaceDisp = dispinterface;
```

C++

```
class IShellFavoritesNameSpaceDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellFavoritesNameSpaceDisp.

8.2.19.1 IShellFavoritesNameSpaceDisp Members

The following tables list the members exposed by IShellFavoritesNameSpaceDisp.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 697)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 697)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	Export (see page 697)	This is Export, a member of class IShellFavoritesNameSpaceDisp.
	Import (see page 697)	This is Import, a member of class IShellFavoritesNameSpaceDisp.
	InvokeContextMenuCommand (see page 698)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionDown (see page 698)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionTo (see page 698)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionUp (see page 698)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.
	NewFolder (see page 698)	This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.
	ResetSort (see page 699)	This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.
	SetRoot (see page 699)	This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.
	Synchronize (see page 699)	This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 700)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2 IShellFavoritesNameSpaceDisp Methods

The methods of the IShellFavoritesNameSpaceDisp class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 697)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 697)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	Export (see page 697)	This is Export, a member of class IShellFavoritesNameSpaceDisp.
	Import (see page 697)	This is Import, a member of class IShellFavoritesNameSpaceDisp.
	InvokeContextMenuCommand (see page 698)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionDown (see page 698)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionTo (see page 698)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionUp (see page 698)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.
	NewFolder (see page 698)	This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.
	ResetSort (see page 699)	This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.
	SetRoot (see page 699)	This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.
	Synchronize (see page 699)	This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.1 IShellFavoritesNameSpaceDisp.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.2 IShellFavoritesNameSpaceDisp.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.3 IShellFavoritesNameSpaceDisp.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.4 IShellFavoritesNameSpaceDisp.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.5 IShellFavoritesNameSpaceDisp.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.6 IShellFavoritesNameSpaceDisp.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.7 IShellFavoritesNameSpaceDisp.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.8 IShellFavoritesNameSpaceDisp.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.9 IShellFavoritesNameSpaceDisp.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.10 IShellFavoritesNameSpaceDisp.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.11 IShellFavoritesNameSpaceDisp.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.2.12 IShellFavoritesNameSpaceDisp.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.3 IShellFavoritesNameSpaceDisp Properties

The properties of the IShellFavoritesNameSpaceDisp class are listed here.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 700)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

8.2.19.3.1 IShellFavoritesNameSpaceDisp.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

8.2.20 IShellNameSpace Interface

Class Hierarchy

Pascal

```
IShellNameSpace = interface(IShellFavoritesNameSpace);
```

C++

```
__interface IShellNameSpace : public IShellFavoritesNameSpace;
```

File

SHDocVw

Description

This is class SHDocVw.IShellNameSpace.

8.2.20.1 IShellNameSpace Members

The following tables list the members exposed by IShellNameSpace.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 692)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 692)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Expand (see page 702)	This is Expand, a member of class IShellNameSpace.
	Export (see page 692)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_Columns (see page 702)	This is Get_Columns, a member of class IShellNameSpace.
	Get_CountViewTypes (see page 702)	This is Get_CountViewTypes, a member of class IShellNameSpace.
	Get_Depth (see page 702)	This is Get_Depth, a member of class IShellNameSpace.
	Get_EnumOptions (see page 703)	This is Get_EnumOptions, a member of class IShellNameSpace.
	Get_Flags (see page 703)	This is Get_Flags, a member of class IShellNameSpace.
	Get_Mode (see page 703)	This is Get_Mode, a member of class IShellNameSpace.
	Get_Root (see page 703)	This is Get_Root, a member of class IShellNameSpace.
	Get_SelectedItem (see page 704)	This is Get_SelectedItem, a member of class IShellNameSpace.
	Get_SubscriptionsEnabled (see page 693)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

	Get_TVFlags (see page 704)	This is Get_TVFlags, a member of class IShellNameSpace.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Import (see page 693)	This is Import, a member of class IShellFavoritesNameSpace.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	InvokeContextMenuCommand (see page 693)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 693)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 694)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 694)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 694)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 694)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SelectedItems (see page 704)	This is SelectedItems, a member of class IShellNameSpace.
	Set_Columns (see page 704)	This is Set_Columns, a member of class IShellNameSpace.
	Set_Depth (see page 704)	This is Set_Depth, a member of class IShellNameSpace.
	Set_EnumOptions (see page 705)	This is Set_EnumOptions, a member of class IShellNameSpace.
	Set_Flags (see page 705)	This is Set_Flags, a member of class IShellNameSpace.
	Set_Mode (see page 705)	This is Set_Mode, a member of class IShellNameSpace.
	Set_Root (see page 705)	This is Set_Root, a member of class IShellNameSpace.
	Set_SelectedItem (see page 706)	This is Set_SelectedItem, a member of class IShellNameSpace.
	Set_TVFlags (see page 706)	This is Set_TVFlags, a member of class IShellNameSpace.
	SetRoot (see page 694)	This is SetRoot, a member of class IShellFavoritesNameSpace.
	SetViewType (see page 706)	This is SetViewType, a member of class IShellNameSpace.
	Synchronize (see page 695)	This is Synchronize, a member of class IShellFavoritesNameSpace.
	UnselectAll (see page 706)	This is UnselectAll, a member of class IShellNameSpace.

Public Properties

	Name	Description
	Columns (see page 707)	This is Columns, a member of class IShellNameSpace.
R	CountViewTypes (see page 707)	This is CountViewTypes, a member of class IShellNameSpace.
	Depth (see page 707)	This is Depth, a member of class IShellNameSpace.
	EnumOptions (see page 707)	This is EnumOptions, a member of class IShellNameSpace.
	Flags (see page 708)	This is Flags, a member of class IShellNameSpace.
	Mode (see page 708)	This is Mode, a member of class IShellNameSpace.
	Root (see page 708)	This is Root, a member of class IShellNameSpace.
	SelectedItem (see page 708)	This is SelectedItem, a member of class IShellNameSpace.
R	SubscriptionsEnabled (see page 695)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	TVFlags (see page 709)	This is TVFlags, a member of class IShellNameSpace.

8.2.20.2 IShellNameSpace Methods

The methods of the IShellNameSpace class are listed here.

Public Methods

	Name	Description
	Expand (see page 702)	This is Expand, a member of class IShellNameSpace.
	Get_Columns (see page 702)	This is Get_Columns, a member of class IShellNameSpace.
	Get_CountViewTypes (see page 702)	This is Get_CountViewTypes, a member of class IShellNameSpace.
	Get_Depth (see page 702)	This is Get_Depth, a member of class IShellNameSpace.
	Get_EnumOptions (see page 703)	This is Get_EnumOptions, a member of class IShellNameSpace.
	Get_Flags (see page 703)	This is Get_Flags, a member of class IShellNameSpace.
	Get_Mode (see page 703)	This is Get_Mode, a member of class IShellNameSpace.

	Get_Root (see page 703)	This is Get_Root, a member of class IShellNameSpace.
	Get_SelectedItem (see page 704)	This is Get_SelectedItem, a member of class IShellNameSpace.
	Get_TVFlags (see page 704)	This is Get_TVFlags, a member of class IShellNameSpace.
	SelectedItems (see page 704)	This is SelectedItems, a member of class IShellNameSpace.
	Set_Columns (see page 704)	This is Set_Columns, a member of class IShellNameSpace.
	Set_Depth (see page 704)	This is Set_Depth, a member of class IShellNameSpace.
	Set_EnumOptions (see page 705)	This is Set_EnumOptions, a member of class IShellNameSpace.
	Set_Flags (see page 705)	This is Set_Flags, a member of class IShellNameSpace.
	Set_Mode (see page 705)	This is Set_Mode, a member of class IShellNameSpace.
	Set_Root (see page 705)	This is Set_Root, a member of class IShellNameSpace.
	Set_SelectedItem (see page 706)	This is Set_SelectedItem, a member of class IShellNameSpace.
	Set_TVFlags (see page 706)	This is Set_TVFlags, a member of class IShellNameSpace.
	SetViewType (see page 706)	This is SetViewType, a member of class IShellNameSpace.
	UnselectAll (see page 706)	This is UnselectAll, a member of class IShellNameSpace.

8.2.20.2.1 IShellNameSpace.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT); safecall;
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class IShellNameSpace.

8.2.20.2.2 IShellNameSpace.Get_Columns Method

Pascal

```
function Get_Columns: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Columns();
```

Description

This is Get_Columns, a member of class IShellNameSpace.

8.2.20.2.3 IShellNameSpace.Get_CountViewTypes Method

Pascal

```
function Get_CountViewTypes: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_CountViewTypes();
```

Description

This is Get_CountViewTypes, a member of class IShellNameSpace.

8.2.20.2.4 IShellNameSpace.Get_Depth Method

Pascal

```
function Get_Depth: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_Depth();
```

Description

This is Get_Depth, a member of class IShellNameSpace.

8.2.20.2.5 IShellNameSpace.Get_EnumOptions Method

Pascal

```
function Get_EnumOptions: Integer; safecall;
```

C++

```
__fastcall int Get_EnumOptions();
```

Description

This is Get_EnumOptions, a member of class IShellNameSpace.

8.2.20.2.6 IShellNameSpace.Get_Flags Method

Pascal

```
function Get_Flags: LongWord; safecall;
```

C++

```
__fastcall LongWord Get_Flags();
```

Description

This is Get_Flags, a member of class IShellNameSpace.

8.2.20.2.7 IShellNameSpace.Get_Mode Method

Pascal

```
function Get_Mode: SYSUINT; safecall;
```

C++

```
__fastcall SYSUINT Get_Mode();
```

Description

This is Get_Mode, a member of class IShellNameSpace.

8.2.20.2.8 IShellNameSpace.Get_Root Method

Pascal

```
function Get_Root: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_Root();
```

Description

This is Get_Root, a member of class IShellNameSpace.

8.2.20.2.9 IShellNameSpace.Get_SelectedItem Method

Pascal

```
function Get_SelectedItem: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_SelectedItem();
```

Description

This is Get_SelectedItem, a member of class IShellNameSpace.

8.2.20.2.10 IShellNameSpace.Get_TVFlags Method

Pascal

```
function Get_TVFlags: LongWord; safecall;
```

C++

```
__fastcall LongWord Get_TVFlags();
```

Description

This is Get_TVFlags, a member of class IShellNameSpace.

8.2.20.2.11 IShellNameSpace.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch; safecall;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class IShellNameSpace.

8.2.20.2.12 IShellNameSpace.Set_Columns Method

Pascal

```
procedure Set_Columns(const bstrColumns: WideString); safecall;
```

C++

```
__fastcall Set_Columns(const BSTR bstrColumns);
```

Description

This is Set_Columns, a member of class IShellNameSpace.

8.2.20.2.13 IShellNameSpace.Set_Depth Method

Pascal

```
procedure Set_Depth(piDepth: SYSINT); safecall;
```

C++

```
__fastcall Set_Depth(SYSINT piDepth);
```

Description

This is Set_Depth, a member of class IShellNameSpace.

8.2.20.2.14 IShellNameSpace.Set_EnumOptions Method

Pascal

```
procedure Set_EnumOptions(pgrfEnumFlags: Integer); safecall;
```

C++

```
__fastcall Set_EnumOptions(int pgrfEnumFlags);
```

Description

This is Set_EnumOptions, a member of class IShellNameSpace.

8.2.20.2.15 IShellNameSpace.Set_Flags Method

Pascal

```
procedure Set_Flags(pdwFlags: LongWord); safecall;
```

C++

```
__fastcall Set_Flags(LongWord pdwFlags);
```

Description

This is Set_Flags, a member of class IShellNameSpace.

8.2.20.2.16 IShellNameSpace.Set_Mode Method

Pascal

```
procedure Set_Mode(puMode: SYSUINT); safecall;
```

C++

```
__fastcall Set_Mode(SYSUINT puMode);
```

Description

This is Set_Mode, a member of class IShellNameSpace.

8.2.20.2.17 IShellNameSpace.Set_Root Method

Pascal

```
procedure Set_Root(pvar: OleVariant); safecall;
```

C++

```
__fastcall Set_Root(OleVariant pvar);
```

Description

This is Set_Root, a member of class IShellNameSpace.

8.2.20.2.18 IShellNameSpace.Set_SelectedItem Method

Pascal

```
procedure Set_SelectedItem(const pItem: IDispatch); safecall;
```

C++

```
__fastcall Set_SelectedItem(const IDispatch pItem);
```

Description

This is Set_SelectedItem, a member of class IShellNameSpace.

8.2.20.2.19 IShellNameSpace.Set_TVFlags Method

Pascal

```
procedure Set_TVFlags(dwFlags: LongWord); safecall;
```

C++

```
__fastcall Set_TVFlags(LongWord dwFlags);
```

Description

This is Set_TVFlags, a member of class IShellNameSpace.

8.2.20.2.20 IShellNameSpace.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT); safecall;
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class IShellNameSpace.

8.2.20.2.21 IShellNameSpace.UnselectAll Method

Pascal

```
procedure UnselectAll; safecall;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class IShellNameSpace.

8.2.20.3 IShellNameSpace Properties

The properties of the IShellNameSpace class are listed here.

Public Properties

	Name	Description
	Columns (see page 707)	This is Columns, a member of class IShellNameSpace.
R	CountViewTypes (see page 707)	This is CountViewTypes, a member of class IShellNameSpace.
	Depth (see page 707)	This is Depth, a member of class IShellNameSpace.
	EnumOptions (see page 707)	This is EnumOptions, a member of class IShellNameSpace.
	Flags (see page 708)	This is Flags, a member of class IShellNameSpace.
	Mode (see page 708)	This is Mode, a member of class IShellNameSpace.
	Root (see page 708)	This is Root, a member of class IShellNameSpace.
	SelectedItem (see page 708)	This is SelectedItem, a member of class IShellNameSpace.
	TVFlags (see page 709)	This is TVFlags, a member of class IShellNameSpace.

8.2.20.3.1 IShellNameSpace.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class IShellNameSpace.

8.2.20.3.2 IShellNameSpace.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class IShellNameSpace.

8.2.20.3.3 IShellNameSpace.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class IShellNameSpace.

8.2.20.3.4 IShellNameSpace.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class IShellNameSpace.

8.2.20.3.5 IShellNameSpace.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class IShellNameSpace.

8.2.20.3.6 IShellNameSpace.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class IShellNameSpace.

8.2.20.3.7 IShellNameSpace.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class IShellNameSpace.

8.2.20.3.8 IShellNameSpace.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class IShellNameSpace.

8.2.20.3.9 IShellNameSpace.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class IShellNameSpace.

8.2.21 IShellNameSpaceDisp Interface

Class Hierarchy

Pascal

```
IShellNameSpaceDisp = dispinterface;

SHDocVw

Description

This is class SHDocVw.IShellNameSpaceDisp.

8.2.21.1 IShellNameSpaceDisp Members

The following tables list the members exposed by IShellNameSpaceDisp.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 710)	This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 711)	This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	Expand (see page 711)	This is Expand, a member of class IShellNameSpaceDisp.
	Export (see page 711)	This is Export, a member of class IShellNameSpaceDisp.
	Import (see page 711)	This is Import, a member of class IShellNameSpaceDisp.
	InvokeContextMenuCommand (see page 711)	This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.
	MoveSelectionDown (see page 712)	This is MoveSelectionDown, a member of class IShellNameSpaceDisp.
	MoveSelectionTo (see page 712)	This is MoveSelectionTo, a member of class IShellNameSpaceDisp.
	MoveSelectionUp (see page 712)	This is MoveSelectionUp, a member of class IShellNameSpaceDisp.
	NewFolder (see page 712)	This is NewFolder, a member of class IShellNameSpaceDisp.
	ResetSort (see page 713)	This is ResetSort, a member of class IShellNameSpaceDisp.
	SelectedItems (see page 713)	This is SelectedItems, a member of class IShellNameSpaceDisp.
	SetRoot (see page 713)	This is SetRoot, a member of class IShellNameSpaceDisp.
	SetViewType (see page 713)	This is SetViewType, a member of class IShellNameSpaceDisp.

	Synchronize (see page 713)	This is Synchronize, a member of class IShellNameSpaceDisp.
	UnselectAll (see page 714)	This is UnselectAll, a member of class IShellNameSpaceDisp.

Public Properties

	Name	Description
	Columns (see page 714)	This is Columns, a member of class IShellNameSpaceDisp.
	CountViewTypes (see page 714)	This is CountViewTypes, a member of class IShellNameSpaceDisp.
	Depth (see page 715)	This is Depth, a member of class IShellNameSpaceDisp.
	EnumOptions (see page 715)	This is EnumOptions, a member of class IShellNameSpaceDisp.
	Flags (see page 715)	This is Flags, a member of class IShellNameSpaceDisp.
	Mode (see page 715)	This is Mode, a member of class IShellNameSpaceDisp.
	Root (see page 716)	This is Root, a member of class IShellNameSpaceDisp.
	SelectedItem (see page 716)	This is SelectedItem, a member of class IShellNameSpaceDisp.
	SubscriptionsEnabled (see page 716)	This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.
	TVFlags (see page 716)	This is TVFlags, a member of class IShellNameSpaceDisp.

8.2.21.2 IShellNameSpaceDisp Methods

The methods of the IShellNameSpaceDisp class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 710)	This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 711)	This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	Expand (see page 711)	This is Expand, a member of class IShellNameSpaceDisp.
	Export (see page 711)	This is Export, a member of class IShellNameSpaceDisp.
	Import (see page 711)	This is Import, a member of class IShellNameSpaceDisp.
	InvokeContextMenuCommand (see page 711)	This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.
	MoveSelectionDown (see page 712)	This is MoveSelectionDown, a member of class IShellNameSpaceDisp.
	MoveSelectionTo (see page 712)	This is MoveSelectionTo, a member of class IShellNameSpaceDisp.
	MoveSelectionUp (see page 712)	This is MoveSelectionUp, a member of class IShellNameSpaceDisp.
	NewFolder (see page 712)	This is NewFolder, a member of class IShellNameSpaceDisp.
	ResetSort (see page 713)	This is ResetSort, a member of class IShellNameSpaceDisp.
	SelectedItems (see page 713)	This is SelectedItems, a member of class IShellNameSpaceDisp.
	SetRoot (see page 713)	This is SetRoot, a member of class IShellNameSpaceDisp.
	SetViewType (see page 713)	This is SetViewType, a member of class IShellNameSpaceDisp.
	Synchronize (see page 713)	This is Synchronize, a member of class IShellNameSpaceDisp.
	UnselectAll (see page 714)	This is UnselectAll, a member of class IShellNameSpaceDisp.

8.2.21.2.1 IShellNameSpaceDisp.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.

8.2.21.2.2 IShellNameSpaceDisp.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.

8.2.21.2.3 IShellNameSpaceDisp.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT);
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class IShellNameSpaceDisp.

8.2.21.2.4 IShellNameSpaceDisp.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellNameSpaceDisp.

8.2.21.2.5 IShellNameSpaceDisp.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellNameSpaceDisp.

8.2.21.2.6 IShellNameSpaceDisp.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.

8.2.21.2.7 IShellNameSpaceDisp.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellNameSpaceDisp.

8.2.21.2.8 IShellNameSpaceDisp.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellNameSpaceDisp.

8.2.21.2.9 IShellNameSpaceDisp.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellNameSpaceDisp.

8.2.21.2.10 IShellNameSpaceDisp.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellNameSpaceDisp.

8.2.21.2.11 IShellNameSpaceDisp.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellNameSpaceDisp.

8.2.21.2.12 IShellNameSpaceDisp.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class IShellNameSpaceDisp.

8.2.21.2.13 IShellNameSpaceDisp.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellNameSpaceDisp.

8.2.21.2.14 IShellNameSpaceDisp.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT);
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class IShellNameSpaceDisp.

8.2.21.2.15 IShellNameSpaceDisp.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellNameSpaceDisp.

8.2.21.2.16 IShellNameSpaceDisp.UnselectAll Method

Pascal

```
procedure UnselectAll;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class IShellNameSpaceDisp.

8.2.21.3 IShellNameSpaceDisp Properties

The properties of the IShellNameSpaceDisp class are listed here.

Public Properties

	Name	Description
	Columns (see page 714)	This is Columns, a member of class IShellNameSpaceDisp.
	CountViewTypes (see page 714)	This is CountViewTypes, a member of class IShellNameSpaceDisp.
	Depth (see page 715)	This is Depth, a member of class IShellNameSpaceDisp.
	EnumOptions (see page 715)	This is EnumOptions, a member of class IShellNameSpaceDisp.
	Flags (see page 715)	This is Flags, a member of class IShellNameSpaceDisp.
	Mode (see page 715)	This is Mode, a member of class IShellNameSpaceDisp.
	Root (see page 716)	This is Root, a member of class IShellNameSpaceDisp.
	SelectedItem (see page 716)	This is SelectedItem, a member of class IShellNameSpaceDisp.
	SubscriptionsEnabled (see page 716)	This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.
	TVFlags (see page 716)	This is TVFlags, a member of class IShellNameSpaceDisp.

8.2.21.3.1 IShellNameSpaceDisp.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class IShellNameSpaceDisp.

8.2.21.3.2 IShellNameSpaceDisp.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class IShellNameSpaceDisp.

8.2.21.3.3 IShellNameSpaceDisp.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class IShellNameSpaceDisp.

8.2.21.3.4 IShellNameSpaceDisp.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class IShellNameSpaceDisp.

8.2.21.3.5 IShellNameSpaceDisp.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class IShellNameSpaceDisp.

8.2.21.3.6 IShellNameSpaceDisp.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class IShellNameSpaceDisp.

8.2.21.3.7 IShellNameSpaceDisp.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class IShellNameSpaceDisp.

8.2.21.3.8 IShellNameSpaceDisp.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class IShellNameSpaceDisp.

8.2.21.3.9 IShellNameSpaceDisp.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.

8.2.21.3.10 IShellNameSpaceDisp.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class IShellNameSpaceDisp.

8.2.22 IShellUIHelper Interface

Class Hierarchy

Pascal

```
IShellUIHelper = interface(IDispatch);
```

C++

```
__interface IShellUIHelper : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellUIHelper.

8.2.22.1 IShellUIHelper Members

The following tables list the members exposed by IShellUIHelper.

Public Methods

	Name	Description
	AddChannel (see page 718)	This is AddChannel, a member of class IShellUIHelper.
	AddDesktopComponent (see page 718)	This is AddDesktopComponent, a member of class IShellUIHelper.
	AddFavorite (see page 718)	This is AddFavorite, a member of class IShellUIHelper.
	AutoCompleteAttach (see page 718)	This is AutoCompleteAttach, a member of class IShellUIHelper.
	AutoCompleteSaveForm (see page 719)	This is AutoCompleteSaveForm, a member of class IShellUIHelper.
	AutoScan (see page 719)	This is AutoScan, a member of class IShellUIHelper.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	ImportExportFavorites (see page 719)	This is ImportExportFavorites, a member of class IShellUIHelper.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	IsSubscribed (see page 719)	This is IsSubscribed, a member of class IShellUIHelper.
	NavigateAndFind (see page 719)	This is NavigateAndFind, a member of class IShellUIHelper.
	RefreshOfflineDesktop (see page 720)	This is RefreshOfflineDesktop, a member of class IShellUIHelper.
	ResetFirstBootMode (see page 720)	This is ResetFirstBootMode, a member of class IShellUIHelper.
	ResetSafeMode (see page 720)	This is ResetSafeMode, a member of class IShellUIHelper.
	ShowBrowserUI (see page 720)	This is ShowBrowserUI, a member of class IShellUIHelper.

8.2.22.2 IShellUIHelper Methods

The methods of the IShellUIHelper class are listed here.

Public Methods

	Name	Description
	AddChannel (see page 718)	This is AddChannel, a member of class IShellUIHelper.
	AddDesktopComponent (see page 718)	This is AddDesktopComponent, a member of class IShellUIHelper.
	AddFavorite (see page 718)	This is AddFavorite, a member of class IShellUIHelper.
	AutoCompleteAttach (see page 718)	This is AutoCompleteAttach, a member of class IShellUIHelper.
	AutoCompleteSaveForm (see page 719)	This is AutoCompleteSaveForm, a member of class IShellUIHelper.
	AutoScan (see page 719)	This is AutoScan, a member of class IShellUIHelper.
	ImportExportFavorites (see page 719)	This is ImportExportFavorites, a member of class IShellUIHelper.
	IsSubscribed (see page 719)	This is IsSubscribed, a member of class IShellUIHelper.
	NavigateAndFind (see page 719)	This is NavigateAndFind, a member of class IShellUIHelper.

	RefreshOfflineDesktop (see page 720)	This is RefreshOfflineDesktop, a member of class IShellUIHelper.
	ResetFirstBootMode (see page 720)	This is ResetFirstBootMode, a member of class IShellUIHelper.
	ResetSafeMode (see page 720)	This is ResetSafeMode, a member of class IShellUIHelper.
	ShowBrowserUI (see page 720)	This is ShowBrowserUI, a member of class IShellUIHelper.

8.2.22.2.1 IShellUIHelper.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString); safecall;
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class IShellUIHelper.

8.2.22.2.2 IShellUIHelper.AddDesktopComponent Method

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant); safecall;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class IShellUIHelper.

8.2.22.2.3 IShellUIHelper.AddFavorite Method

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant); safecall;
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class IShellUIHelper.

8.2.22.2.4 IShellUIHelper.AutoCompleteAttach Method

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant); safecall;
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class IShellUIHelper.

8.2.22.2.5 IShellUIHelper.AutoCompleteSaveForm Method

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant); safecall;
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class IShellUIHelper.

8.2.22.2.6 IShellUIHelper.AutoScan Method

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant); safecall;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class IShellUIHelper.

8.2.22.2.7 IShellUIHelper.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString); safecall;
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class IShellUIHelper.

8.2.22.2.8 IShellUIHelper.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool; safecall;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class IShellUIHelper.

8.2.22.2.9 IShellUIHelper.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant); safecall;
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class IShellUIHelper.

8.2.22.2.10 IShellUIHelper.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop; safecall;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class IShellUIHelper.

8.2.22.2.11 IShellUIHelper.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode; safecall;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class IShellUIHelper.

8.2.22.2.12 IShellUIHelper.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode; safecall;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class IShellUIHelper.

8.2.22.2.13 IShellUIHelper.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class IShellUIHelper.

8.2.23 IShellUIHelperDisp Interface

Class Hierarchy

Pascal

```
IShellUIHelperDisp = dispinterface;
```

C++

```
class IShellUIHelperDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellUIHelperDisp.

8.2.23.1 IShellUIHelperDisp Members

The following tables list the members exposed by IShellUIHelperDisp.

Public Methods

	Name	Description
	AddChannel (see page 722)	This is AddChannel, a member of class IShellUIHelperDisp.
	AddDesktopComponent (see page 722)	This is AddDesktopComponent, a member of class IShellUIHelperDisp.
	AddFavorite (see page 722)	This is AddFavorite, a member of class IShellUIHelperDisp.
	AutoCompleteAttach (see page 722)	This is AutoCompleteAttach, a member of class IShellUIHelperDisp.
	AutoCompleteSaveForm (see page 723)	This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.
	AutoScan (see page 723)	This is AutoScan, a member of class IShellUIHelperDisp.
	ImportExportFavorites (see page 723)	This is ImportExportFavorites, a member of class IShellUIHelperDisp.
	IsSubscribed (see page 723)	This is IsSubscribed, a member of class IShellUIHelperDisp.
	NavigateAndFind (see page 724)	This is NavigateAndFind, a member of class IShellUIHelperDisp.
	RefreshOfflineDesktop (see page 724)	This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.
	ResetFirstBootMode (see page 724)	This is ResetFirstBootMode, a member of class IShellUIHelperDisp.
	ResetSafeMode (see page 724)	This is ResetSafeMode, a member of class IShellUIHelperDisp.
	ShowBrowserUI (see page 724)	This is ShowBrowserUI, a member of class IShellUIHelperDisp.

8.2.23.2 IShellUIHelperDisp Methods

The methods of the IShellUIHelperDisp class are listed here.

Public Methods

	Name	Description
	AddChannel (see page 722)	This is AddChannel, a member of class IShellUIHelperDisp.
	AddDesktopComponent (see page 722)	This is AddDesktopComponent, a member of class IShellUIHelperDisp.
	AddFavorite (see page 722)	This is AddFavorite, a member of class IShellUIHelperDisp.
	AutoCompleteAttach (see page 722)	This is AutoCompleteAttach, a member of class IShellUIHelperDisp.
	AutoCompleteSaveForm (see page 723)	This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.

	AutoScan (see page 723)	This is AutoScan, a member of class IShellUIHelperDisp.
	ImportExportFavorites (see page 723)	This is ImportExportFavorites, a member of class IShellUIHelperDisp.
	IsSubscribed (see page 723)	This is IsSubscribed, a member of class IShellUIHelperDisp.
	NavigateAndFind (see page 724)	This is NavigateAndFind, a member of class IShellUIHelperDisp.
	RefreshOfflineDesktop (see page 724)	This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.
	ResetFirstBootMode (see page 724)	This is ResetFirstBootMode, a member of class IShellUIHelperDisp.
	ResetSafeMode (see page 724)	This is ResetSafeMode, a member of class IShellUIHelperDisp.
	ShowBrowserUI (see page 724)	This is ShowBrowserUI, a member of class IShellUIHelperDisp.

8.2.23.2.1 IShellUIHelperDisp.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString);
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class IShellUIHelperDisp.

8.2.23.2.2 IShellUIHelperDisp.AddDesktopComponent Method

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant);
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class IShellUIHelperDisp.

8.2.23.2.3 IShellUIHelperDisp.AddFavorite Method

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant);
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class IShellUIHelperDisp.

8.2.23.2.4 IShellUIHelperDisp.AutoCompleteAttach Method

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant);
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class IShellUIHelperDisp.

8.2.23.2.5 IShellUIHelperDisp.AutoCompleteSaveForm Method

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant);
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.

8.2.23.2.6 IShellUIHelperDisp.AutoScan Method

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant);
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class IShellUIHelperDisp.

8.2.23.2.7 IShellUIHelperDisp.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString);
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class IShellUIHelperDisp.

8.2.23.2.8 IShellUIHelperDisp.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class IShellUIHelperDisp.

8.2.23.2.9 IShellUIHelperDisp.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant);
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class IShellUIHelperDisp.

8.2.23.2.10 IShellUIHelperDisp.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.

8.2.23.2.11 IShellUIHelperDisp.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class IShellUIHelperDisp.

8.2.23.2.12 IShellUIHelperDisp.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class IShellUIHelperDisp.

8.2.23.2.13 IShellUIHelperDisp.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class IShellUIHelperDisp.

8.2.24 IShellWindows Interface

Class Hierarchy

Pascal

```
IShellWindows = interface(IDispatch);
```

C++

```
__interface IShellWindows : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellWindows.

8.2.24.1 IShellWindows Members

The following tables list the members exposed by IShellWindows.

Public Methods

	Name	Description
	_NewEnum (see page 726)	This is _NewEnum, a member of class IShellWindows.
	FindWindowSW (see page 726)	This is FindWindowSW, a member of class IShellWindows.
	Get_Count (see page 726)	This is Get_Count, a member of class IShellWindows.
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	Item (see page 727)	This is Item, a member of class IShellWindows.
	OnActivated (see page 727)	This is OnActivated, a member of class IShellWindows.
	OnCreated (see page 727)	This is OnCreated, a member of class IShellWindows.
	OnNavigate (see page 727)	This is OnNavigate, a member of class IShellWindows.
	ProcessAttachDetach (see page 727)	This is ProcessAttachDetach, a member of class IShellWindows.
	Register (see page 728)	This is Register, a member of class IShellWindows.
	RegisterPending (see page 728)	This is RegisterPending, a member of class IShellWindows.
	Revoke (see page 728)	This is Revoke, a member of class IShellWindows.

Public Properties

	Name	Description
R	Count (see page 729)	This is Count, a member of class IShellWindows.

8.2.24.2 IShellWindows Methods

The methods of the IShellWindows class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 726)	This is _NewEnum, a member of class IShellWindows.
	FindWindowSW (see page 726)	This is FindWindowSW, a member of class IShellWindows.
	Get_Count (see page 726)	This is Get_Count, a member of class IShellWindows.
	Item (see page 727)	This is Item, a member of class IShellWindows.
	OnActivated (see page 727)	This is OnActivated, a member of class IShellWindows.
	OnCreated (see page 727)	This is OnCreated, a member of class IShellWindows.
	OnNavigate (see page 727)	This is OnNavigate, a member of class IShellWindows.
	ProcessAttachDetach (see page 727)	This is ProcessAttachDetach, a member of class IShellWindows.
	Register (see page 728)	This is Register, a member of class IShellWindows.
	RegisterPending (see page 728)	This is RegisterPending, a member of class IShellWindows.
	Revoke (see page 728)	This is Revoke, a member of class IShellWindows.

8.2.24.2.1 IShellWindows._NewEnum Method

Pascal

```
function _NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class IShellWindows.

8.2.24.2.2 IShellWindows.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch; safecall;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class IShellWindows.

8.2.24.2.3 IShellWindows.Get_Count Method

Pascal

```
function Get_Count: Integer; safecall;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class IShellWindows.

8.2.24.2.4 IShellWindows.Item Method

Pascal

```
function Item(index: OleVariant): IDispatch; safecall;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class IShellWindows.

8.2.24.2.5 IShellWindows.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool); safecall;
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class IShellWindows.

8.2.24.2.6 IShellWindows.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown); safecall;
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class IShellWindows.

8.2.24.2.7 IShellWindows.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant); safecall;
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class IShellWindows.

8.2.24.2.8 IShellWindows.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool); safecall;
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class IShellWindows.

8.2.24.2.9 IShellWindows.Register Method

Pascal

```
procedure Register(const pid: IDispatch; hWnd: Integer; swClass: SYSINT; out plCookie:
Integer); safecall;
```

C++

```
__fastcall Register(const IDispatch pid, int hWnd, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class IShellWindows.

8.2.24.2.10 IShellWindows.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer); safecall;
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class IShellWindows.

8.2.24.2.11 IShellWindows.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer); safecall;
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class IShellWindows.

8.2.24.3 IShellWindows Properties

The properties of the IShellWindows class are listed here.

Public Properties

	Name	Description
	Count (see page 729)	This is Count, a member of class IShellWindows.

8.2.24.3.1 IShellWindows.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IShellWindows.

8.2.25 IShellWindowsDisp Interface

Class Hierarchy

Pascal

```
IShellWindowsDisp = dispinterface;
```

C++

```
class IShellWindowsDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellWindowsDisp.

8.2.25.1 IShellWindowsDisp Members

The following tables list the members exposed by IShellWindowsDisp.

Public Methods

	Name	Description
	_NewEnum (see page 730)	This is _NewEnum, a member of class IShellWindowsDisp.
	FindWindowSW (see page 730)	This is FindWindowSW, a member of class IShellWindowsDisp.
	Item (see page 730)	This is Item, a member of class IShellWindowsDisp.
	OnActivated (see page 731)	This is OnActivated, a member of class IShellWindowsDisp.
	OnCreated (see page 731)	This is OnCreated, a member of class IShellWindowsDisp.
	OnNavigate (see page 731)	This is OnNavigate, a member of class IShellWindowsDisp.
	ProcessAttachDetach (see page 731)	This is ProcessAttachDetach, a member of class IShellWindowsDisp.
	Register (see page 731)	This is Register, a member of class IShellWindowsDisp.
	RegisterPending (see page 732)	This is RegisterPending, a member of class IShellWindowsDisp.
	Revoke (see page 732)	This is Revoke, a member of class IShellWindowsDisp.

Public Properties

	Name	Description
	Count (see page 732)	This is Count, a member of class IShellWindowsDisp.

8.2.25.2 IShellWindowsDisp Methods

The methods of the IShellWindowsDisp class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 730)	This is _NewEnum, a member of class IShellWindowsDisp.
	FindWindowSW (see page 730)	This is FindWindowSW, a member of class IShellWindowsDisp.
	Item (see page 730)	This is Item, a member of class IShellWindowsDisp.
	OnActivated (see page 731)	This is OnActivated, a member of class IShellWindowsDisp.
	OnCreated (see page 731)	This is OnCreated, a member of class IShellWindowsDisp.
	OnNavigate (see page 731)	This is OnNavigate, a member of class IShellWindowsDisp.
	ProcessAttachDetach (see page 731)	This is ProcessAttachDetach, a member of class IShellWindowsDisp.
	Register (see page 731)	This is Register, a member of class IShellWindowsDisp.
	RegisterPending (see page 732)	This is RegisterPending, a member of class IShellWindowsDisp.
	Revoke (see page 732)	This is Revoke, a member of class IShellWindowsDisp.

8.2.25.2.1 IShellWindowsDisp._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class IShellWindowsDisp.

8.2.25.2.2 IShellWindowsDisp.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class IShellWindowsDisp.

8.2.25.2.3 IShellWindowsDisp.Item Method

Pascal

```
function Item(index: OleVariant): IDispatch;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class IShellWindowsDisp.

8.2.25.2.4 IShellWindowsDisp.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool);
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class IShellWindowsDisp.

8.2.25.2.5 IShellWindowsDisp.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown);
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class IShellWindowsDisp.

8.2.25.2.6 IShellWindowsDisp.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant);
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class IShellWindowsDisp.

8.2.25.2.7 IShellWindowsDisp.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool);
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class IShellWindowsDisp.

8.2.25.2.8 IShellWindowsDisp.Register Method

Pascal

```
procedure Register(const pid: IDispatch; hWnd: Integer; swClass: SYSINT; out plCookie:
Integer);
```

C++

```
__fastcall Register(const IDispatch pid, int hWnd, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class IShellWindowsDisp.

8.2.25.2.9 IShellWindowsDisp.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer);
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class IShellWindowsDisp.

8.2.25.2.10 IShellWindowsDisp.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer);
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class IShellWindowsDisp.

8.2.25.3 IShellWindowsDisp Properties

The properties of the IShellWindowsDisp class are listed here.

Public Properties

	Name	Description
	Count (see page 732)	This is Count, a member of class IShellWindowsDisp.

8.2.25.3.1 IShellWindowsDisp.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IShellWindowsDisp.

8.2.26 IWebBrowser Interface

IWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).

Class Hierarchy

Pascal

```
IWebBrowser = interface(IDispatch);
```

C++

```
__interface IWebBrowser : public IDispatch;
```

File

SHDocVw

Description

IWebBrowser exposes methods to be implemented by TWebBrowser (see page 504) in order to allow you to create a customized Web browsing application or to add Internet, file and network browsing, document viewing, and data downloading capabilities to your applications.

Note: Because IWebBrowser resides in SHDOCVW.DLL, you must have SHDOCVW.DLL installed to use this component. This DLL ships with Internet Explorer 4 and later.

8.2.26.1 IWebBrowser Members

The following tables list the members exposed by IWebBrowser.

Public Methods

	Name	Description
	Get_Application (see page 735)	Returns the value of Application (see page 745).
	Get_Busy (see page 735)	Returns the value of Application (see page 745).
	Get_Container (see page 735)	Returns the value of Container (see page 746).
	Get_Document (see page 736)	Returns the value of Document (see page 746).
	Get_Height (see page 736)	Returns the value of Height (see page 746).
	Get_Left (see page 736)	Returns the value of Left (see page 747).
	Get_LocationName (see page 737)	Returns the value of LocationName (see page 747).
	Get_LocationURL (see page 737)	Returns the value of LocationURL (see page 747).
	Get_Parent (see page 737)	Returns the value of Parent (see page 748).
	Get_Top (see page 738)	Returns the value of Top (see page 748).
	Get_TopLevelContainer (see page 738)	Returns the value of TopLevelContainer (see page 748).
	Get_type_ (see page 738)	Returns the value of type_ (see page 749).
	Get_Width (see page 739)	Returns the value of Width (see page 749).
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	GoBack (see page 739)	Navigates to the previous item in the history list.
	GoForward (see page 739)	Navigates to the next item in the history list.

	GoHome (see page 740)	Navigates to the current start page.
	GoSearch (see page 740)	Navigates to the current search page.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	Navigate (see page 741)	Navigates to a resource identified by a path name or URL.
	Refresh (see page 742)	Reloads the current document.
	Refresh2 (see page 742)	Reloads the current document if necessary.
	Set_Height (see page 743)	Modifies the object height in pixels.
	Set_Left (see page 743)	Modifies the X axis coordinate of the left edge of the window.
	Set_Top (see page 743)	Modifies the Y axis coordinate of the upper edge of the window.
	Set_Width (see page 744)	Modifies the object width in pixels.
	Stop (see page 744)	Stops the current operation.

Public Properties

	Name	Description
R	Application (see page 745)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, for the interface for the WebBrowser (see page 837) control.
R	Busy (see page 745)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
R	Container (see page 746)	Provides access to the automation interface of the Web browser's container.
R	Document (see page 746)	Provides access to the Automation interface of the active document.
	Height (see page 746)	Specifies the object height in pixels.
	Left (see page 747)	Specifies the X axis coordinate of the left edge of the window.
R	LocationName (see page 747)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 747)	Identifies the URL or path of the document or folder currently displayed.
R	Parent (see page 748)	Provides access to the Automation interface of the Web browser's container.
	Top (see page 748)	Specifies the Y axis coordinate of the upper edge of the window.
R	TopLevelContainer (see page 748)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 749)	Indicates the type name of the contained document object.
	Width (see page 749)	Specifies the object width in pixels.

8.2.26.2 IWebBrowser Methods

The methods of the IWebBrowser class are listed here.

Public Methods

	Name	Description
	Get_Application (see page 735)	Returns the value of Application (see page 745).
	Get_Busy (see page 735)	Returns the value of Application (see page 745).
	Get_Container (see page 735)	Returns the value of Container (see page 746).
	Get_Document (see page 736)	Returns the value of Document (see page 746).
	Get_Height (see page 736)	Returns the value of Height (see page 746).
	Get_Left (see page 736)	Returns the value of Left (see page 747).
	Get_LocationName (see page 737)	Returns the value of LocationName (see page 747).
	Get_LocationURL (see page 737)	Returns the value of LocationURL (see page 747).
	Get_Parent (see page 737)	Returns the value of Parent (see page 748).
	Get_Top (see page 738)	Returns the value of Top (see page 748).
	Get_TopLevelContainer (see page 738)	Returns the value of TopLevelContainer (see page 748).
	Get_type_ (see page 738)	Returns the value of type_ (see page 749).
	Get_Width (see page 739)	Returns the value of Width (see page 749).
	GoBack (see page 739)	Navigates to the previous item in the history list.
	GoForward (see page 739)	Navigates to the next item in the history list.
	GoHome (see page 740)	Navigates to the current start page.
	GoSearch (see page 740)	Navigates to the current search page.

	Navigate (see page 741)	Navigates to a resource identified by a path name or URL.
	Refresh (see page 742)	Reloads the current document.
	Refresh2 (see page 742)	Reloads the current document if necessary.
	Set_Height (see page 743)	Modifies the object height in pixels.
	Set_Left (see page 743)	Modifies the X axis coordinate of the left edge of the window.
	Set_Top (see page 743)	Modifies the Y axis coordinate of the upper edge of the window.
	Set_Width (see page 744)	Modifies the object width in pixels.
	Stop (see page 744)	Stops the current operation.

8.2.26.2.1 IWebBrowser.Get_Application Method

Returns the value of Application (see page 745).

Pascal

```
function Get_Application: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

Use Get_Application to access the interface for the application containing the WebBrowser (see page 837) control.

See Also

Application (see page 745)

8.2.26.2.2 IWebBrowser.Get_Busy Method

Returns the value of Application (see page 745).

Pascal

```
function Get_Busy: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Busy();
```

Description

Use Get_Busy to determine whether the Web browser component is currently navigating to a new URL or downloading a document.

See Also

Busy (see page 745)

8.2.26.2.3 IWebBrowser.Get_Container Method

Returns the value of Container (see page 746).

Pascal

```
function Get_Container: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

Use Get_Container to access the interface for the Web browser's parent or container. If the Web browser does not have a

container with an Automation interface, Get_Container returns nil.

See Also

Container (see page 746)

8.2.26.2.4 IWebBrowser.Get_Document Method

Returns the value of Document (see page 746).

Pascal

```
function Get_Document: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

Use Get_Document to access an IDispatch (see page 3494) interface for manipulating the contents of the HTML document through the COM object model.

See Also

Document (see page 746)

8.2.26.2.5 IWebBrowser.Get_Height Method

Returns the value of Height (see page 746).

Pascal

```
function Get_Height: Integer; safecall;
```

C++

```
__fastcall int Get_Height();
```

Description

Use Get_Height to determine the height of the object.

See Also

Set_Height (see page 743)

Height (see page 746)

8.2.26.2.6 IWebBrowser.Get_Left Method

Returns the value of Left (see page 747).

Pascal

```
function Get_Left: Integer; safecall;
```

C++

```
__fastcall int Get_Left();
```

Description

Use Get_Left to determine the left coordinate of the window.

See Also

Left (see page 747)

Set_Left (see page 743)

8.2.26.2.7 IWebBrowser.Get_LocationName Method

Returns the value of LocationName (see page 747).

Pascal

```
function Get_LocationName: WideString; safecall;
```

C++

```
__fastcall BSTR Get_LocationName();
```

Description

Use Get_LocationName to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, Get_LocationName returns the title of that page. If the resource is a folder or file on the local network or on a disk, Get_LocationName is the full UNC name of the folder or file.

See Also

LocationName (see page 747)

8.2.26.2.8 IWebBrowser.Get_LocationURL Method

Returns the value of LocationURL (see page 747).

Pascal

```
function Get_LocationURL: WideString; safecall;
```

C++

```
__fastcall BSTR Get_LocationURL();
```

Description

Use Get_LocationURL to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, Get_LocationName (see page 737) returns its URL. If the resource is a folder or file on the local network or on a disk, Get_LocationName (see page 737) is the full UNC name of the folder or file.

See Also

LocationURL (see page 747)

8.2.26.2.9 IWebBrowser.Get_Parent Method

Returns the value of Parent (see page 748).

Pascal

```
function Get_Parent: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

Use Get_Parent to access the interface for the Web browser's parent or container.

See Also

Parent (see page 748)

8.2.26.2.10 IWebBrowser.Get_Top Method

Returns the value of Top (see page 748).

Pascal

```
function Get_Top: Integer; safecall;
```

C++

```
__fastcall int Get_Top();
```

Description

Use Get_Top to determine the upper coordinate of the window.

See Also

Top (see page 748)

Set_Top (see page 743)

8.2.26.2.11 IWebBrowser.Get_TopLevelContainer Method

Returns the value of TopLevelContainer (see page 748).

Pascal

```
function Get_TopLevelContainer: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_TopLevelContainer();
```

Description

Use Get_TopLevelContainer to determine whether the Web browser has a parent with an Automation interface.

See Also

TopLevelContainer (see page 748)

8.2.26.2.12 IWebBrowser.Get_type_ Method

Returns the value of type_ (see page 749).

Pascal

```
function Get_type_: WideString; safecall;
```

C++

```
__fastcall BSTR Get_type_();
```

Description

Use Get_type_ to determine the type of the Automation object whose interface is represented by the Document (see page 746) property.

See Also

type_ (see page 749)

8.2.26.2.13 IWebBrowser.Get_Width Method

Returns the value of Width (see page 749).

Pascal

```
function Get_Width: Integer; safecall;
```

C++

```
__fastcall int Get_Width();
```

Description

Use Get_Width to determine the width of the object.

See Also

Width (see page 749)

Set_Width (see page 744)

8.2.26.2.14 IWebBrowser.GoBack Method

Navigates to the previous item in the history list.

Pascal

```
procedure GoBack; safecall;
```

C++

```
__fastcall GoBack();
```

Description

Call GoBack to return to the last document in the history list. GoBack has no effect unless the history list contains additional documents.

Note: The Navigate (see page 741) or Navigate2 command can change the history list, depending on the specified flags.

See Also

GoForward (see page 739)

GoHome (see page 740)

GoSearch (see page 740)

8.2.26.2.15 IWebBrowser.GoForward Method

Navigates to the next item in the history list.

Pascal

```
procedure GoForward; safecall;
```

C++

```
__fastcall GoForward();
```

Description

Call GoForward to navigate to the next document in the history list. GoForward reverses the effect of the last GoBack (see page 739) command.

See Also

GoBack (see page 739)

GoHome (see page 740)

GoSearch (see page 740)

8.2.26.2.16 IWebBrowser.GoHome Method

Navigates to the current start page.

Pascal

```
procedure GoHome; safecall;
```

C++

```
__fastcall GoHome();
```

Description

Call GoHome to navigate to the registered home or start page. The URL for this page is specified in the Registry at `HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main` under the name Startpage. You can change this value using the TRegistry or TRegistryIniFile object, or using the Navigation tab of the Internet Explorer Options dialog.

See Also

GoBack (see page 739)

GoForward (see page 739)

GoSearch (see page 740)

TRegistry

TRegistryIniFile

8.2.26.2.17 IWebBrowser.GoSearch Method

Navigates to the current search page.

Pascal

```
procedure GoSearch; safecall;
```

C++

```
__fastcall GoSearch();
```

Description

Call GoSearch to navigate to the registered search page. The URL for this page is specified in the Registry at `HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main`, under the name SearchPage. You can change this value using the TRegistry or TRegistryIniFile object, or using the Navigation tab of the Internet Explorer Options dialog.

See Also

GoBack (see page 739)

GoForward (see page 739)

GoHome (see page 740)

TRegistry

TRegistryIniFile

8.2.26.2.18 IWebBrowser.Navigate Method

Navigates to a resource identified by a path name or URL.

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); safecall;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

Use Navigate to locate and download a specific resource. Navigate can send an HTTP message to a specified URL and display the results or simply display the results of a specified file.

URL specifies the UNC path name of a file or the Uniform Resource Locator of an Internet resource that the Web browser should display.

Flags is a set of values that specify whether to add the resource to the history list, to read from or write to the cache, or to display the resource in a new window. It can be a sum of zero or more of the following.

Constant	Value	Meaning
navOpenInNewWindow (see page 854)	1	Open the resource or file in a new window.
navNoHistory (see page 853)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 854)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 854)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 853)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate to generate an HTTP POST message. If PostData is NULL, Navigate generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

Note: To navigate to a location that cannot be expressed as an URL (for example, to an item identifier list), use the Navigate2 method instead.

See Also

Navigate2 (see page 755)

GoBack (see page 739)

GoForward (see page 739)

GoHome (see page 740)

GoSearch (see page 740)

8.2.26.2.19 IWebBrowser.Refresh Method

Reloads the current document.

Pascal

```
procedure Refresh; safecall;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh to reload the current document. This is useful when the Web browser is displaying the resource at an URL that may have changed.

Refresh always sends a pragma:nocache header, telling the server not to return a cached copy. This can cause problems with some servers. To prevent the pragma:nocache header, or to refresh only expired pages, use the Refresh2 (see page 742) method instead.

See Also

Refresh2 (see page 742)

Document (see page 746)

8.2.26.2.20 IWebBrowser.Refresh2 Method

Reloads the current document if necessary.

Pascal

```
procedure Refresh2(var Level: OleVariant); safecall;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

Call Refresh2 to reload the current document. Unlike the Refresh (see page 742) method, Refresh2 lets you specify what level of refresh to perform.

Level indicates what type of information is refreshed. The following table lists the possible values.

Constant	Value	Meaning
REFRESH_NORMAL (see page 878)	0	Perform a lightweight refresh that does not include the pragma:nocache header. The pragma:nocache header tells the server not to return a cached copy. This can cause problems with some servers.
REFRESH_IFEXPIRED (see page 878)	1	Only refresh if the page has expired. Do not include the pragma:nocache header.
REFRESH_CONTINUE (see page 877)	2	For internal use only.
REFRESH_COMPLETELY (see page 877)	3	Perform a full refresh, including the pragma:nocache header. Using this option is the same as calling the Refresh (see page 742) method.

When Level is omitted, a value of REFRESH_COMPLETELY (see page 877) is assumed.

See Also

Refresh (see page 742)

8.2.26.2.21 IWebBrowser.Set_Height Method

Modifies the object height in pixels.

Pascal

```
procedure Set_Height(pl: Integer); safecall;
```

C++

```
__fastcall Set_Height(int pl);
```

Description

Use Set_Height to modify the height of the object.

See Also

Get_Height (see page 736)

Height (see page 746)

8.2.26.2.22 IWebBrowser.Set_Left Method

Modifies the X axis coordinate of the left edge of the window.

Pascal

```
procedure Set_Left(pl: Integer); safecall;
```

C++

```
__fastcall Set_Left(int pl);
```

Description

Use Set_Left to modify the upper coordinate of the window and therefore the position of the window on the X axis.

See Also

Left (see page 747)

Get_Left (see page 736)

8.2.26.2.23 IWebBrowser.Set_Top Method

Modifies the Y axis coordinate of the upper edge of the window.

Pascal

```
procedure Set_Top(pl: Integer); safecall;
```

C++

```
__fastcall Set_Top(int pl);
```

Description

Use Top (see page 748) to modify the upper coordinate of the window and therefore the position of the window on the Y axis.

See Also

Top (see page 748)

Get_Top (see page 738)

8.2.26.2.24 IWebBrowser.Set_Width Method

Modifies the object width in pixels.

Pascal

```
procedure Set_Width(pl: Integer); safecall;
```

C++

```
__fastcall Set_Width(int pl);
```

Description

Use Width (see page 749) to modify the width of the object.

See Also

Width (see page 749)

Get_Width (see page 739)

8.2.26.2.25 IWebBrowser.Stop Method

Stops the current operation.

Pascal

```
procedure Stop; safecall;
```

C++

```
__fastcall Stop();
```

Description

Stop cancels any pending navigation or download operation and terminates any dynamic page elements, such as background sounds and animations.

See Also

GoForward (see page 739)

GoHome (see page 740)

GoSearch (see page 740)

GoBack (see page 739)

Navigate (see page 741)

8.2.26.3 IWebBrowser Properties

The properties of the IWebBrowser class are listed here.

Public Properties

	Name	Description
R	Application (see page 745)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, for the interface for the WebBrowser (see page 837) control.
R	Busy (see page 745)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
R	Container (see page 746)	Provides access to the automation interface of the Web browser's container.
R	Document (see page 746)	Provides access to the Automation interface of the active document.
	Height (see page 746)	Specifies the object height in pixels.
	Left (see page 747)	Specifies the X axis coordinate of the left edge of the window.
R	LocationName (see page 747)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 747)	Identifies the URL or path of the document or folder currently displayed.
R	Parent (see page 748)	Provides access to the Automation interface of the Web browser's container.
	Top (see page 748)	Specifies the Y axis coordinate of the upper edge of the window.
R	TopLevelContainer (see page 748)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 749)	Indicates the type name of the contained document object.
	Width (see page 749)	Specifies the object width in pixels.

8.2.26.3.1 IWebBrowser.Application Property

Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, for the interface for the WebBrowser (see page 837) control.

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

Use Application to access the interface for the application containing the WebBrowser (see page 837) control. If the application does not have an Automation interface, or if the interface is not accessible, Application provides access to the Automation interface of the Web browser control.

See Also

Get_Application (see page 735)

8.2.26.3.2 IWebBrowser.Busy Property

Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

Read (see page 3634) Busy to determine whether the Web browser component is currently navigating to a new URL or downloading a document.

Note: The Web browser receives events at the beginning and end of each operation, as well as at discrete points during a download operation.

See Also

Get_Busy (see page 735)

8.2.26.3.3 IWebBrowser.Container Property

Provides access to the automation interface of the Web browser's container.

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

Use Container to access the interface for the Web browser's parent or container. If the Web browser does not have a container with an Automation interface, Container is nil.

See Also

Get_Container (see page 735)

8.2.26.3.4 IWebBrowser.Document Property

Provides access to the Automation interface of the active document.

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

Use Document to access an IDispatch (see page 3494) interface for manipulating the contents of the HTML document through the COM object model.

See Also

Get_Document (see page 736)

8.2.26.3.5 IWebBrowser.Height Property

Specifies the object height in pixels.

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

Read (see page 3634) Height to determine the height of the object. Write (see page 3707) Height to modify the height of the object.

See Also

Get_Height (see page 736)

Set_Height (see page 743)

8.2.26.3.6 IWebBrowser.Left Property

Specifies the X axis coordinate of the left edge of the window.

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

Read (see page 3634) Left to determine the left coordinate of the window. Write (see page 3707) Left to modify the upper coordinate of the window and therefore the position of the window on the X axis.

See Also

Get_Left (see page 736)

Set_Left (see page 743)

8.2.26.3.7 IWebBrowser.LocationName Property

Identifies the short (UI-friendly) name of the URL or file currently displayed.

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

Read (see page 3634) LocationName to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName is the title of that page. If the resource is a folder or file on the local network or on a disk, LocationName is the full UNC name of the folder or file.

See Also

Get_LocationName (see page 737)

8.2.26.3.8 IWebBrowser.LocationURL Property

Identifies the URL or path of the document or folder currently displayed.

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

Read (see page 3634) LocationURL to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName (see page 747) is its URL. If the resource is a folder or file on the local network or on a disk, LocationName (see page 747) is the full UNC name of the folder or file.

See Also

Get_LocationURL (see page 737)

8.2.26.3.9 IWebBrowser.Parent Property

Provides access to the Automation interface of the Web browser's container.

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

Use Parent to access the interface for the Web browser's parent or container.

See Also

Get_Parent (see page 737)

8.2.26.3.10 IWebBrowser.Top Property

Specifies the Y axis coordinate of the upper edge of the window.

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

Read (see page 3634) Top to determine the upper coordinate of the window. Write (see page 3707) Top to modify the upper coordinate of the window and therefore the position of the window on the Y axis.

See Also

Get_Top (see page 738)

Set_Top (see page 743)

8.2.26.3.11 IWebBrowser.TopLevelContainer Property

Indicates whether the Web browser is a top-level Automation object.

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

Read (see page 3634) TopLevelContainer to determine whether the Web browser has a parent with an Automation interface.

See Also

Get_TopLevelContainer (see page 738)

8.2.26.3.12 IWebBrowser.type_ Property

Indicates the type name of the contained document object.

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

Read (see page 3634) type_ to determine the type of the Automation object whose interface is represented by the Document (see page 746) property.

See Also

Get_type_ (see page 738)

8.2.26.3.13 IWebBrowser.Width Property

Specifies the object width in pixels.

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

Read (see page 3634) Width to determine the width of the object. Write (see page 3707) Width to modify the width of the object.

See Also

Get_Width (see page 739)

Set_Width (see page 744)

8.2.27 IWebBrowser2 Interface

IWebBrowser2 provides access to the Web browser functionality of Microsoft Shell Doc Object and Control Library (SHDOCVW.DLL).

Class Hierarchy

Pascal

```
IWebBrowser2 = interface(IWebBrowserApp);
```

C++

```
__interface IWebBrowser2 : public IWebBrowserApp;
```

File

SHDocVw

Description

IWebBrowser2 exposes methods to be implemented by TWebBrowser (see page 504) in order to allow you to create a customized Web browsing application or to add Internet, file and network browsing, document viewing, and data downloading capabilities to your applications.

Note: Because IWebBrowser2 resides in SHDOCVW.DLL, you must have SHDOCVW.DLL installed to use this component. This DLL ships with Internet Explorer 4 and later.

8.2.27.1 IWebBrowser2 Members

The following tables list the members exposed by IWebBrowser2.

Public Methods

	Name	Description
	ClientToWindow (see page 778)	This is ClientToWindow, a member of class IWebBrowserApp.
	ExecWB (see page 752)	Executes a command.
	Get_AddressBar (see page 753)	Returns the value of AddressBar (see page 760).
	Get_Application (see page 735)	Returns the value of Application (see page 745).
	Get_Busy (see page 735)	Returns the value of Application (see page 745).
	Get_Container (see page 735)	Returns the value of Container (see page 746).
	Get_Document (see page 736)	Returns the value of Document (see page 746).
	Get_FullName (see page 778)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 779)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_Height (see page 736)	Returns the value of Height (see page 746).
	Get_HWnd (see page 779)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_Left (see page 736)	Returns the value of Left (see page 747).
	Get_LocationName (see page 737)	Returns the value of LocationName (see page 747).
	Get_LocationURL (see page 737)	Returns the value of LocationURL (see page 747).
	Get_MenuBar (see page 779)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 779)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Offline (see page 753)	Returns the value of Offline (see page 760).
	Get_Parent (see page 737)	Returns the value of Parent (see page 748).
	Get_Path (see page 779)	This is Get_Path, a member of class IWebBrowserApp.
	Get_ReadyState (see page 754)	Returns the value of ReadyState (see page 760).
	Get_RegisterAsBrowser (see page 754)	Returns the value of RegisterAsBrowser (see page 761).
	Get_RegisterAsDropTarget (see page 754)	Returns the value of RegisterAsDropTarget (see page 761).
	Get_Resizable (see page 754)	Returns the value of Resizable (see page 762).
	Get_Silent (see page 755)	Returns the value of Silent (see page 762).
	Get_StatusBar (see page 780)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 780)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_TheaterMode (see page 755)	Returns the value of TheaterMode (see page 762).
	Get_ToolBar (see page 780)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Top (see page 738)	Returns the value of Top (see page 748).
	Get_TopLevelContainer (see page 738)	Returns the value of TopLevelContainer (see page 748).
	Get_type_ (see page 738)	Returns the value of type_ (see page 749).
	Get_Visible (see page 780)	This is Get_Visible, a member of class IWebBrowserApp.
	Get_Width (see page 739)	Returns the value of Width (see page 749).
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetProperty (see page 781)	This is GetProperty, a member of class IWebBrowserApp.

	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	GoBack (see page 739)	Navigates to the previous item in the history list.
	GoForward (see page 739)	Navigates to the next item in the history list.
	GoHome (see page 740)	Navigates to the current start page.
	GoSearch (see page 740)	Navigates to the current search page.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	Navigate (see page 741)	Navigates to a resource identified by a path name or URL.
	Navigate2 (see page 755)	Navigates to a specified resource.
	PutProperty (see page 781)	This is PutProperty, a member of class IWebBrowserApp.
	QueryStatusWB (see page 757)	Returns information about what commands the Web browser supports.
	Quit (see page 781)	This is Quit, a member of class IWebBrowserApp.
	Refresh (see page 742)	Reloads the current document.
	Refresh2 (see page 742)	Reloads the current document if necessary.
	Set_AddressBar (see page 757)	Sets the value of AddressBar (see page 760).
	Set_FullScreen (see page 781)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_Height (see page 743)	Modifies the object height in pixels.
	Set_Left (see page 743)	Modifies the X axis coordinate of the left edge of the window.
	Set_MenuBar (see page 781)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_Offline (see page 757)	Sets the value of Offline (see page 760).
	Set_RegisterAsBrowser (see page 758)	Sets the value of RegisterAsBrowser (see page 761).
	Set_RegisterAsDropTarget (see page 758)	Sets the value of RegisterAsDropTarget (see page 761).
	Set_Resizable (see page 758)	Sets the value of Resizable (see page 762).
	Set_Silent (see page 759)	Sets the value of Silent (see page 762).
	Set_StatusBar (see page 782)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 782)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_TheaterMode (see page 759)	Sets the value of TheaterMode (see page 762).
	Set_ToolBar (see page 782)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Top (see page 743)	Modifies the Y axis coordinate of the upper edge of the window.
	Set_Visible (see page 782)	This is Set_Visible, a member of class IWebBrowserApp.
	Set_Width (see page 744)	Modifies the object width in pixels.
	ShowBrowserBar (see page 759)	Used to hide or show a specific browser bar.
	Stop (see page 744)	Stops the current operation.

Public Properties

	Name	Description
	AddressBar (see page 760)	Specifies whether the address bar is visible.
R	Application (see page 745)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, for the interface for the WebBrowser (see page 837) control.
R	Busy (see page 745)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
R	Container (see page 746)	Provides access to the automation interface of the Web browser's container.
R	Document (see page 746)	Provides access to the Automation interface of the active document.
R	FullName (see page 783)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 783)	This is FullScreen, a member of class IWebBrowserApp.
	Height (see page 746)	Specifies the object height in pixels.
R	HWnd (see page 783)	This is HWnd, a member of class IWebBrowserApp.
	Left (see page 747)	Specifies the X axis coordinate of the left edge of the window.
R	LocationName (see page 747)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 747)	Identifies the URL or path of the document or folder currently displayed.
	MenuBar (see page 783)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 784)	This is Name, a member of class IWebBrowserApp.
	Offline (see page 760)	Indicates whether the document is loaded from the local cache or not.
R	Parent (see page 748)	Provides access to the Automation interface of the Web browser's container.

R	Path (see page 784)	This is Path, a member of class IWebBrowserApp.
R	ReadyState (see page 760)	Indicates the current state.
	RegisterAsBrowser (see page 761)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 761)	Specifies whether users can load a document using the drag-and-drop operation.
	Resizable (see page 762)	Speficies whether the object can be resized.
	Silent (see page 762)	Specifies whether the dialog boxes can be displayed.
	StatusBar (see page 784)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 784)	This is StatusText, a member of class IWebBrowserApp.
	TheaterMode (see page 762)	Specifies if the object is in theater mode.
	ToolBar (see page 785)	This is ToolBar, a member of class IWebBrowserApp.
	Top (see page 748)	Specifies the Y axis coordinate of the upper edge of the window.
R	TopLevelContainer (see page 748)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 749)	Indicates the type name of the contained document object.
	Visible (see page 785)	This is Visible, a member of class IWebBrowserApp.
	Width (see page 749)	Specifies the object width in pixels.

8.2.27.2 IWebBrowser2 Methods

The methods of the IWebBrowser2 class are listed here.

Public Methods

	Name	Description
	ExecWB (see page 752)	Executes a command.
	Get_AddressBar (see page 753)	Returns the value of AddressBar (see page 760).
	Get_Offline (see page 753)	Returns the value of Offline (see page 760).
	Get_ReadyState (see page 754)	Returns the value of ReadyState (see page 760).
	Get_RegisterAsBrowser (see page 754)	Returns the value of RegisterAsBrowser (see page 761).
	Get_RegisterAsDropTarget (see page 754)	Returns the value of RegisterAsDropTarget (see page 761).
	Get_Resizable (see page 754)	Returns the value of Resizable (see page 762).
	Get_Silent (see page 755)	Returns the value of Silent (see page 762).
	Get_TheaterMode (see page 755)	Returns the value of TheaterMode (see page 762).
	Navigate2 (see page 755)	Navigates to a specified resource.
	QueryStatusWB (see page 757)	Returns information about what commands the Web browser supports.
	Set_AddressBar (see page 757)	Sets the value of AddressBar (see page 760).
	Set_Offline (see page 757)	Sets the value of Offline (see page 760).
	Set_RegisterAsBrowser (see page 758)	Sets the value of RegisterAsBrowser (see page 761).
	Set_RegisterAsDropTarget (see page 758)	Sets the value of RegisterAsDropTarget (see page 761).
	Set_Resizable (see page 758)	Sets the value of Resizable (see page 762).
	Set_Silent (see page 759)	Sets the value of Silent (see page 762).
	Set_TheaterMode (see page 759)	Sets the value of TheaterMode (see page 762).
	ShowBrowserBar (see page 759)	Used to hide or show a specific browser bar.

8.2.27.2.1 IWebBrowser2.ExecWB Method

Executes a command.

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant); safecall;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

ExecWB uses the IOleCommandTarget interface to pass a command to the Web browser control. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command to execute. The Web Browser does not support all the commands for which Microsoft provides constants. Use the QueryStatusWB (see page 757) method to determine what commands can be used.

cmdexecopt modifies how the command is executed.

pvaIn specifies a Variant (see page 3421) array that contains any input arguments. This value can be omitted if there are no input arguments.

pvaOut specifies a Variant (see page 3421) that receives the results of the command, if any. This value can be omitted if there are no results.

See Also

QueryStatusWB (see page 757)

DoObjectVerb

GetObjectVerbs

8.2.27.2.2 IWebBrowser2.Get_AddressBar Method

Returns the value of AddressBar (see page 760).

Pascal

```
function Get_AddressBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_AddressBar();
```

Description

Get_AddressBar is used to return the value of AddressBar (see page 760).

Note: TWebBrowser (see page 504) does not have an address bar; this property is used for compatibility with Internet Explorer.

See Also

AddressBar (see page 760)

8.2.27.2.3 IWebBrowser2.Get_Offline Method

Returns the value of Offline (see page 760).

Pascal

```
function Get_Offline: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Offline();
```

Description

Get_Offline is used to return the value of Offline (see page 760).

See Also

Offline (see page 760)

8.2.27.2.4 IWebBrowser2.Get_ReadyState Method

Returns the value of ReadyState (see page 760).

Pascal

```
function Get_ReadyState: tagREADYSTATE; safecall;
```

C++

```
__fastcall tagREADYSTATE Get_ReadyState();
```

Description

Get_ReadyState is used to return the value of ReadyState (see page 760).

See Also

ReadyState (see page 760)

8.2.27.2.5 IWebBrowser2.Get_RegisterAsBrowser Method

Returns the value of RegisterAsBrowser (see page 761).

Pascal

```
function Get_RegisterAsBrowser: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_RegisterAsBrowser();
```

Description

Get_RegisterAsBrowser is used to return the value of RegisterAsBrowser (see page 761).

See Also

RegisterAsBrowser (see page 761)

8.2.27.2.6 IWebBrowser2.Get_RegisterAsDropTarget Method

Returns the value of RegisterAsDropTarget (see page 761).

Pascal

```
function Get_RegisterAsDropTarget: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_RegisterAsDropTarget();
```

Description

Get_RegisterAsDropTarget is used to return the value of RegisterAsDropTarget (see page 761).

See Also

RegisterAsDropTarget (see page 761)

8.2.27.2.7 IWebBrowser2.Get_Resizable Method

Returns the value of Resizable (see page 762).

Pascal

```
function Get_Resizable: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Resizable();
```

Description

Get_Resizable is used to return the value of Resizable (see page 762).

See Also

Resizable (see page 762)

8.2.27.2.8 IWebBrowser2.Get_Silent Method

Returns the value of Silent (see page 762).

Pascal

```
function Get_Silent: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Silent();
```

Description

Get_Silent is used to return the value of Silent (see page 762).

See Also

Silent (see page 762)

8.2.27.2.9 IWebBrowser2.Get_TheaterMode Method

Returns the value of TheaterMode (see page 762).

Pascal

```
function Get_TheaterMode: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_TheaterMode();
```

Description

Get_TheaterMode is used to return the value of TheaterMode (see page 762).

Note: TWebBrowser (see page 504) does not have theater mode; this property is used for compatibility with Internet Explorer.

See Also

TheaterMode (see page 762)

8.2.27.2.10 IWebBrowser2.Navigate2 Method

Navigates to a specified resource.

Pascal

```
procedure Navigate2(const URL: OleVariant; const Flags: OleVariant; const TargetFrameName:
OleVariant; const PostData: OleVariant; const Headers: OleVariant); safecall;
```

C++

```
__fastcall Navigate2(const OleVariant URL, const OleVariant Flags, const OleVariant
TargetFrameName, const OleVariant PostData, const OleVariant Headers);
```

Description

Use Navigate2 to locate and download a specific resource. Navigate (see page 741) can send an HTTP message to a specified URL and display the results, display the results of a specified file, or navigate to a resource that cannot be expressed as an URL, such as an item identifier list.

URL specifies the UNC path name of a file, the Uniform Resource Locator of an Internet resource, or a pointer to an item identifier list (PIDL).

Flags is a set of values that specify whether to add the resource to the history list, to read from or write to the cache, or to display the resource in a new window. It can be a sum of zero or more of the following.

Constant	Value	Meaning
navOpenInNewWindow (see page 854)	1	Open the resource or file in a new window.
navNoHistory (see page 853)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 854)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 854)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 853)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate (see page 741) in order to generate an HTTP POST message. If PostData is NULL, Navigate (see page 741) generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

See Also

Navigate (see page 512)

GoBack (see page 510)

GoForward (see page 510)

GoHome (see page 511)

GoSearch (see page 511)

OnBeforeNavigate2 (see page 545)

OnNavigateComplete2 (see page 562)

TWebRequest

8.2.27.2.11 IWebBrowser2.QueryStatusWB Method

Returns information about what commands the Web browser supports.

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF; safecall;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

Use QueryStatusWB to determine what commands can be executed using the ExecWB (see page 752) method. QueryStatusWB uses the QueryStatus method of the IOleCommandTarget interface to obtain information about the status of commands. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command about which you want information.

QueryStatusWB returns a value obtained by adding together flags that indicate the status of the command.

See Also

ExecWB (see page 752)

8.2.27.2.12 IWebBrowser2.Set_AddressBar Method

Sets the value of AddressBar (see page 760).

Pascal

```
procedure Set_AddressBar(Value: WordBool); safecall;
```

C++

```
__fastcall Set_AddressBar(WordBool Value);
```

Description

Set_AddressBar is used to set the value of AddressBar (see page 760).

Note: TWebBrowser (see page 504) does not have an address bar; this property is used for compatibility with Internet Explorer.

See Also

AddressBar (see page 760)

8.2.27.2.13 IWebBrowser2.Set_Offline Method

Sets the value of Offline (see page 760).

Pascal

```
procedure Set_Offline(pbOffline: WordBool); safecall;
```

C++

```
__fastcall Set_Offline(WordBool pbOffline);
```

Description

Set_Offline is used to set the value of Offline (see page 760).

See Also

Offline (see page 760)

8.2.27.2.14 IWebBrowser2.Set_RegisterAsBrowser Method

Sets the value of RegisterAsBrowser (see page 761).

Pascal

```
procedure Set_RegisterAsBrowser(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_RegisterAsBrowser(WordBool pbRegister);
```

Description

Set_RegisterAsBrowser is used to set the value of RegisterAsBrowser (see page 761).

See Also

RegisterAsBrowser (see page 761)

8.2.27.2.15 IWebBrowser2.Set_RegisterAsDropTarget Method

Sets the value of RegisterAsDropTarget (see page 761).

Pascal

```
procedure Set_RegisterAsDropTarget(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_RegisterAsDropTarget(WordBool pbRegister);
```

Description

Set_RegisterAsDropTargetis used to set the value of RegisterAsDropTarget (see page 761).

See Also

RegisterAsDropTarget (see page 761)

8.2.27.2.16 IWebBrowser2.Set_Resizable Method

Sets the value of Resizable (see page 762).

Pascal

```
procedure Set_Resizable(Value: WordBool); safecall;
```

C++

```
__fastcall Set_Resizable(WordBool Value);
```

Description

Set_Resizable is used to set the value of Resizable (see page 762).

See Also

Resizable (see page 762)

8.2.27.2.17 IWebBrowser2.Set_Silent Method

Sets the value of Silent (see page 762).

Pascal

```
procedure Set_Silent(pbSilent: WordBool); safecall;
```

C++

```
__fastcall Set_Silent(WordBool pbSilent);
```

Description

Set_Silent is used to set the value of Silent (see page 762).

See Also

Silent (see page 762)

8.2.27.2.18 IWebBrowser2.Set_TheaterMode Method

Sets the value of TheaterMode (see page 762).

Pascal

```
procedure Set_TheaterMode(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_TheaterMode(WordBool pbRegister);
```

Description

Set_TheaterMode is used to set the value of TheaterMode (see page 762).

Note: TWebBrowser (see page 504) does not have theater mode; this property is used for compatibility with Internet Explorer.

See Also

TheaterMode (see page 762)

8.2.27.2.19 IWebBrowser2.ShowBrowserBar Method

Used to hide or show a specific browser bar.

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); safecall;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

Note: ShowBrowserBar is used for compatibility with Internet Explorer.

8.2.27.3 IWebBrowser2 Properties

The properties of the IWebBrowser2 class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 760)	Specifies whether the address bar is visible.
	Offline (see page 760)	Indicates whether the document is loaded from the local cache or not.
R	ReadyState (see page 760)	Indicates the current state.
	RegisterAsBrowser (see page 761)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 761)	Specifies whether users can load a document using the drag-and-drop operation.
	Resizable (see page 762)	Speficies whether the object can be resized.
	Silent (see page 762)	Specifies whether the dialog boxes can be displayed.
	TheaterMode (see page 762)	Specifies if the object is in theater mode.

8.2.27.3.1 IWebBrowser2.AddressBar Property

Specifies whether the address bar is visible.

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

Has a boolean value that specifies the visibility of the address bar.

Note: TWebBrowser (see page 504) does not have an address bar; this property is used for compatibility with Internet Explorer.

8.2.27.3.2 IWebBrowser2.Offline Property

Indicates whether the document is loaded from the local cache or not.

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

Set Offline to True to work offline; the HTML documents are loaded from the local cache.

Note: This property is used to save HTML pages to a local cache so that they are available for offline work.

See Also

Navigate2 (see page 514)

Navigate2 (see page 755)

8.2.27.3.3 IWebBrowser2.ReadyState Property

Indicates the current state.

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

Read (see page 3634) ReadyState to obtain state information. Use this information to avoid attempting to use the Web browser control when it is not ready to perform an action.

The following table lists the possible values.

Constant	Value	Meaning
READYSTATE_UNINITIALIZED (see page 877)	0	Default initialization state. The Control has not begun loading any properties.
READYSTATE_LOADING (see page 876)	1	The control is loading its properties.
READYSTATE_LOADED (see page 876)	2	The control has initialized its properties, but is not yet interactive.
READYSTATE_INTERACTIVE (see page 876)	3	The control is interactive, but not all of its data is available. (It is downloading a document or frame).
READYSTATE_COMPLETE (see page 875)	4	The control is interactive and all of its data is available. (The current document is fully downloaded).

See Also

ComponentState

ControlState

Busy (see page 524)

8.2.27.3.4 IWebBrowser2.RegisterAsBrowser Property

Registers the control as a top-level browser for target name resolution.

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

Set RegisterAsBrowser to True when implementing IWebBrowser2 (see page 749) in order to create a top-level browser.

8.2.27.3.5 IWebBrowser2.RegisterAsDropTarget Property

Specifies whether users can load a document using the drag-and-drop operation.

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

Set RegisterAsDropTarget to True to allow users drop HTML documents onto the Web browser. When RegisterAsDropTarget is

True, users can load a document by dragging it onto the component, otherwise dragging and dropping has no effect.

See Also

Navigate2 (see page 755)

Navigate2 (see page 514)

8.2.27.3.6 IWebBrowser2.Resizable Property

Speficies whether the object can be resized.

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

Has a boolean value that specifies whether the object can be resized.

Note: The Resizable property is used for compatibility with Internet Explorer.

8.2.27.3.7 IWebBrowser2.Silent Property

Specifies whether the dialog boxes can be displayed.

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

Set Silent to True to prevent the Web browser control from displaying dialog boxes.

8.2.27.3.8 IWebBrowser2.TheaterMode Property

Specifies if the object is in theater mode.

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

TheaterMode is used to change the display of Internet Explorer to use theater or normal mode.

Note: TWebBrowser (see page 504) does not have theater mode; this property is used for compatibility with Internet Explorer.

8.2.28 IWebBrowser2Disp Interface

Class Hierarchy

Pascal

```
IWebBrowser2Disp = dispinterface;
```

C++

```
class IWebBrowser2Disp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowser2Disp.

8.2.28.1 IWebBrowser2Disp Members

The following tables list the members exposed by IWebBrowser2Disp.

Public Methods

	Name	Description
	ClientToWindow (see page 764)	This is ClientToWindow, a member of class IWebBrowser2Disp.
	ExecWB (see page 765)	This is ExecWB, a member of class IWebBrowser2Disp.
	GetProperty (see page 765)	This is GetProperty, a member of class IWebBrowser2Disp.
	GoBack (see page 765)	This is GoBack, a member of class IWebBrowser2Disp.
	GoForward (see page 765)	This is GoForward, a member of class IWebBrowser2Disp.
	GoHome (see page 766)	This is GoHome, a member of class IWebBrowser2Disp.
	GoSearch (see page 766)	This is GoSearch, a member of class IWebBrowser2Disp.
	Navigate (see page 766)	This is Navigate, a member of class IWebBrowser2Disp.
	Navigate2 (see page 766)	This is Navigate2, a member of class IWebBrowser2Disp.
	PutProperty (see page 767)	This is PutProperty, a member of class IWebBrowser2Disp.
	QueryStatusWB (see page 767)	This is QueryStatusWB, a member of class IWebBrowser2Disp.
	Quit (see page 767)	This is Quit, a member of class IWebBrowser2Disp.
	Refresh (see page 767)	This is Refresh, a member of class IWebBrowser2Disp.
	Refresh2 (see page 767)	This is Refresh2, a member of class IWebBrowser2Disp.
	ShowBrowserBar (see page 768)	This is ShowBrowserBar, a member of class IWebBrowser2Disp.
	Stop (see page 768)	This is Stop, a member of class IWebBrowser2Disp.

Public Properties

	Name	Description
	AddressBar (see page 769)	This is AddressBar, a member of class IWebBrowser2Disp.
	Application (see page 769)	This is Application, a member of class IWebBrowser2Disp.
	Busy (see page 769)	This is Busy, a member of class IWebBrowser2Disp.
	Container (see page 769)	This is Container, a member of class IWebBrowser2Disp.
	Document (see page 770)	This is Document, a member of class IWebBrowser2Disp.
	FullName (see page 770)	This is FullName, a member of class IWebBrowser2Disp.
	FullScreen (see page 770)	This is FullScreen, a member of class IWebBrowser2Disp.
	Height (see page 770)	This is Height, a member of class IWebBrowser2Disp.

	HWnd (see page 771)	This is HWnd, a member of class IWebBrowser2Disp.
	Left (see page 771)	This is Left, a member of class IWebBrowser2Disp.
	LocationName (see page 771)	This is LocationName, a member of class IWebBrowser2Disp.
	LocationURL (see page 771)	This is LocationURL, a member of class IWebBrowser2Disp.
	MenuBar (see page 771)	This is MenuBar, a member of class IWebBrowser2Disp.
	Name (see page 772)	This is Name, a member of class IWebBrowser2Disp.
	Offline (see page 772)	This is Offline, a member of class IWebBrowser2Disp.
	Parent (see page 772)	This is Parent, a member of class IWebBrowser2Disp.
	Path (see page 772)	This is Path, a member of class IWebBrowser2Disp.
	ReadyState (see page 773)	This is ReadyState, a member of class IWebBrowser2Disp.
	RegisterAsBrowser (see page 773)	This is RegisterAsBrowser, a member of class IWebBrowser2Disp.
	RegisterAsDropTarget (see page 773)	This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.
	Resizable (see page 773)	This is Resizable, a member of class IWebBrowser2Disp.
	Silent (see page 773)	This is Silent, a member of class IWebBrowser2Disp.
	StatusBar (see page 774)	This is StatusBar, a member of class IWebBrowser2Disp.
	StatusText (see page 774)	This is StatusText, a member of class IWebBrowser2Disp.
	TheaterMode (see page 774)	This is TheaterMode, a member of class IWebBrowser2Disp.
	ToolBar (see page 774)	This is ToolBar, a member of class IWebBrowser2Disp.
	Top (see page 775)	This is Top, a member of class IWebBrowser2Disp.
	TopLevelContainer (see page 775)	This is TopLevelContainer, a member of class IWebBrowser2Disp.
	type_ (see page 775)	This is type_, a member of class IWebBrowser2Disp.
	Visible (see page 775)	This is Visible, a member of class IWebBrowser2Disp.
	Width (see page 775)	This is Width, a member of class IWebBrowser2Disp.

8.2.28.2 IWebBrowser2Disp Methods

The methods of the IWebBrowser2Disp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 764)	This is ClientToWindow, a member of class IWebBrowser2Disp.
	ExecWB (see page 765)	This is ExecWB, a member of class IWebBrowser2Disp.
	GetProperty (see page 765)	This is GetProperty, a member of class IWebBrowser2Disp.
	GoBack (see page 765)	This is GoBack, a member of class IWebBrowser2Disp.
	GoForward (see page 765)	This is GoForward, a member of class IWebBrowser2Disp.
	GoHome (see page 766)	This is GoHome, a member of class IWebBrowser2Disp.
	GoSearch (see page 766)	This is GoSearch, a member of class IWebBrowser2Disp.
	Navigate (see page 766)	This is Navigate, a member of class IWebBrowser2Disp.
	Navigate2 (see page 766)	This is Navigate2, a member of class IWebBrowser2Disp.
	PutProperty (see page 767)	This is PutProperty, a member of class IWebBrowser2Disp.
	QueryStatusWB (see page 767)	This is QueryStatusWB, a member of class IWebBrowser2Disp.
	Quit (see page 767)	This is Quit, a member of class IWebBrowser2Disp.
	Refresh (see page 767)	This is Refresh, a member of class IWebBrowser2Disp.
	Refresh2 (see page 767)	This is Refresh2, a member of class IWebBrowser2Disp.
	ShowBrowserBar (see page 768)	This is ShowBrowserBar, a member of class IWebBrowser2Disp.
	Stop (see page 768)	This is Stop, a member of class IWebBrowser2Disp.

8.2.28.2.1 IWebBrowser2Disp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowser2Disp.

8.2.28.2.2 IWebBrowser2Disp.ExecWB Method

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant);
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

This is ExecWB, a member of class IWebBrowser2Disp.

8.2.28.2.3 IWebBrowser2Disp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowser2Disp.

8.2.28.2.4 IWebBrowser2Disp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowser2Disp.

8.2.28.2.5 IWebBrowser2Disp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowser2Disp.

8.2.28.2.6 IWebBrowser2Disp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowser2Disp.

8.2.28.2.7 IWebBrowser2Disp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowser2Disp.

8.2.28.2.8 IWebBrowser2Disp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowser2Disp.

8.2.28.2.9 IWebBrowser2Disp.Navigate2 Method

Pascal

```
procedure Navigate2(const URL: OleVariant; const Flags: OleVariant; const TargetFrameName:
OleVariant; const PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate2(const OleVariant URL, const OleVariant Flags, const OleVariant
TargetFrameName, const OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate2, a member of class IWebBrowser2Disp.

8.2.28.2.10 IWebBrowser2Disp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowser2Disp.

8.2.28.2.11 IWebBrowser2Disp.QueryStatusWB Method

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

This is QueryStatusWB, a member of class IWebBrowser2Disp.

8.2.28.2.12 IWebBrowser2Disp.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowser2Disp.

8.2.28.2.13 IWebBrowser2Disp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowser2Disp.

8.2.28.2.14 IWebBrowser2Disp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowser2Disp.

8.2.28.2.15 IWebBrowser2Disp.ShowBrowserBar Method

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant);
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

This is ShowBrowserBar, a member of class IWebBrowser2Disp.

8.2.28.2.16 IWebBrowser2Disp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowser2Disp.

8.2.28.3 IWebBrowser2Disp Properties

The properties of the IWebBrowser2Disp class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 769)	This is AddressBar, a member of class IWebBrowser2Disp.
	Application (see page 769)	This is Application, a member of class IWebBrowser2Disp.
	Busy (see page 769)	This is Busy, a member of class IWebBrowser2Disp.
	Container (see page 769)	This is Container, a member of class IWebBrowser2Disp.
	Document (see page 770)	This is Document, a member of class IWebBrowser2Disp.
	FullName (see page 770)	This is FullName, a member of class IWebBrowser2Disp.
	FullScreen (see page 770)	This is FullScreen, a member of class IWebBrowser2Disp.
	Height (see page 770)	This is Height, a member of class IWebBrowser2Disp.
	HWnd (see page 771)	This is HWnd, a member of class IWebBrowser2Disp.
	Left (see page 771)	This is Left, a member of class IWebBrowser2Disp.
	LocationName (see page 771)	This is LocationName, a member of class IWebBrowser2Disp.
	LocationURL (see page 771)	This is LocationURL, a member of class IWebBrowser2Disp.
	MenuBar (see page 771)	This is MenuBar, a member of class IWebBrowser2Disp.
	Name (see page 772)	This is Name, a member of class IWebBrowser2Disp.
	Offline (see page 772)	This is Offline, a member of class IWebBrowser2Disp.
	Parent (see page 772)	This is Parent, a member of class IWebBrowser2Disp.
	Path (see page 772)	This is Path, a member of class IWebBrowser2Disp.
	ReadyState (see page 773)	This is ReadyState, a member of class IWebBrowser2Disp.
	RegisterAsBrowser (see page 773)	This is RegisterAsBrowser, a member of class IWebBrowser2Disp.

	RegisterAsDropTarget (see page 773)	This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.
	Resizable (see page 773)	This is Resizable, a member of class IWebBrowser2Disp.
	Silent (see page 773)	This is Silent, a member of class IWebBrowser2Disp.
	StatusBar (see page 774)	This is StatusBar, a member of class IWebBrowser2Disp.
	StatusText (see page 774)	This is StatusText, a member of class IWebBrowser2Disp.
	TheaterMode (see page 774)	This is TheaterMode, a member of class IWebBrowser2Disp.
	ToolBar (see page 774)	This is ToolBar, a member of class IWebBrowser2Disp.
	Top (see page 775)	This is Top, a member of class IWebBrowser2Disp.
	TopLevelContainer (see page 775)	This is TopLevelContainer, a member of class IWebBrowser2Disp.
	type_ (see page 775)	This is type_, a member of class IWebBrowser2Disp.
	Visible (see page 775)	This is Visible, a member of class IWebBrowser2Disp.
	Width (see page 775)	This is Width, a member of class IWebBrowser2Disp.

8.2.28.3.1 IWebBrowser2Disp.AddressBar Property

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

This is AddressBar, a member of class IWebBrowser2Disp.

8.2.28.3.2 IWebBrowser2Disp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowser2Disp.

8.2.28.3.3 IWebBrowser2Disp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowser2Disp.

8.2.28.3.4 IWebBrowser2Disp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowser2Disp.

8.2.28.3.5 IWebBrowser2Disp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowser2Disp.

8.2.28.3.6 IWebBrowser2Disp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowser2Disp.

8.2.28.3.7 IWebBrowser2Disp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowser2Disp.

8.2.28.3.8 IWebBrowser2Disp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowser2Disp.

8.2.28.3.9 IWebBrowser2Disp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowser2Disp.

8.2.28.3.10 IWebBrowser2Disp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowser2Disp.

8.2.28.3.11 IWebBrowser2Disp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowser2Disp.

8.2.28.3.12 IWebBrowser2Disp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowser2Disp.

8.2.28.3.13 IWebBrowser2Disp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowser2Disp.

8.2.28.3.14 IWebBrowser2Disp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowser2Disp.

8.2.28.3.15 IWebBrowser2Disp.Offline Property

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

This is Offline, a member of class IWebBrowser2Disp.

8.2.28.3.16 IWebBrowser2Disp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowser2Disp.

8.2.28.3.17 IWebBrowser2Disp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowser2Disp.

8.2.28.3.18 IWebBrowser2Disp.ReadyState Property

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

This is ReadyState, a member of class IWebBrowser2Disp.

8.2.28.3.19 IWebBrowser2Disp.RegisterAsBrowser Property

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

This is RegisterAsBrowser, a member of class IWebBrowser2Disp.

8.2.28.3.20 IWebBrowser2Disp.RegisterAsDropTarget Property

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.

8.2.28.3.21 IWebBrowser2Disp.Resizable Property

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

This is Resizable, a member of class IWebBrowser2Disp.

8.2.28.3.22 IWebBrowser2Disp.Silent Property

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

This is Silent, a member of class IWebBrowser2Disp.

8.2.28.3.23 IWebBrowser2Disp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowser2Disp.

8.2.28.3.24 IWebBrowser2Disp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowser2Disp.

8.2.28.3.25 IWebBrowser2Disp.TheaterMode Property

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

This is TheaterMode, a member of class IWebBrowser2Disp.

8.2.28.3.26 IWebBrowser2Disp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowser2Disp.

8.2.28.3.27 IWebBrowser2Disp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowser2Disp.

8.2.28.3.28 IWebBrowser2Disp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowser2Disp.

8.2.28.3.29 IWebBrowser2Disp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowser2Disp.

8.2.28.3.30 IWebBrowser2Disp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowser2Disp.

8.2.28.3.31 IWebBrowser2Disp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowser2Disp.

8.2.29 IWebBrowserApp Interface

Class Hierarchy

Pascal

```
IWebBrowserApp = interface(IWebBrowser);
```

C++

```
__interface IWebBrowserApp : public IWebBrowser;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserApp.

8.2.29.1 IWebBrowserApp Members

The following tables list the members exposed by IWebBrowserApp.

Public Methods

	Name	Description
	ClientToWindow (see page 778)	This is ClientToWindow, a member of class IWebBrowserApp.
	Get_Application (see page 735)	Returns the value of Application (see page 745).
	Get_Busy (see page 735)	Returns the value of Application (see page 745).
	Get_Container (see page 735)	Returns the value of Container (see page 746).
	Get_Document (see page 736)	Returns the value of Document (see page 746).
	Get_FullName (see page 778)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 779)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_Height (see page 736)	Returns the value of Height (see page 746).
	Get_HWnd (see page 779)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_Left (see page 736)	Returns the value of Left (see page 747).
	Get_LocationName (see page 737)	Returns the value of LocationName (see page 747).
	Get_LocationURL (see page 737)	Returns the value of LocationURL (see page 747).
	Get_MenuBar (see page 779)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 779)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Parent (see page 737)	Returns the value of Parent (see page 748).
	Get_Path (see page 779)	This is Get_Path, a member of class IWebBrowserApp.
	Get_StatusBar (see page 780)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 780)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_ToolBar (see page 780)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Top (see page 738)	Returns the value of Top (see page 748).
	Get_TopLevelContainer (see page 738)	Returns the value of TopLevelContainer (see page 748).
	Get_type_ (see page 738)	Returns the value of type_ (see page 749).
	Get_Visible (see page 780)	This is Get_Visible, a member of class IWebBrowserApp.

	Get_Width (see page 739)	Returns the value of Width (see page 749).
	GetIDsOfNames (see page 3495)	GetIDsOfNames returns a set of dispatch identifiers (**dispid**s) for a given member name.
	GetProperty (see page 781)	This is GetProperty, a member of class IWebBrowserApp.
	GetTypeInfo (see page 3496)	GetTypeInfo returns the object's type information.
	GetTypeInfoCount (see page 3496)	GetTypeInfoCount returns the count of type information interfaces.
	GoBack (see page 739)	Navigates to the previous item in the history list.
	GoForward (see page 739)	Navigates to the next item in the history list.
	GoHome (see page 740)	Navigates to the current start page.
	GoSearch (see page 740)	Navigates to the current search page.
	Invoke (see page 3497)	Invoke performs a call to a late-binded property or method.
	Navigate (see page 741)	Navigates to a resource identified by a path name or URL.
	PutProperty (see page 781)	This is PutProperty, a member of class IWebBrowserApp.
	Quit (see page 781)	This is Quit, a member of class IWebBrowserApp.
	Refresh (see page 742)	Reloads the current document.
	Refresh2 (see page 742)	Reloads the current document if necessary.
	Set_FullScreen (see page 781)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_Height (see page 743)	Modifies the object height in pixels.
	Set_Left (see page 743)	Modifies the X axis coordinate of the left edge of the window.
	Set_MenuBar (see page 781)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_StatusBar (see page 782)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 782)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_ToolBar (see page 782)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Top (see page 743)	Modifies the Y axis coordinate of the upper edge of the window.
	Set_Visible (see page 782)	This is Set_Visible, a member of class IWebBrowserApp.
	Set_Width (see page 744)	Modifies the object width in pixels.
	Stop (see page 744)	Stops the current operation.

Public Properties

	Name	Description
R	Application (see page 745)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 837) control, or, if that is unavailable, for the interface for the WebBrowser (see page 837) control.
R	Busy (see page 745)	Indicates whether the WebBrowser (see page 837) control is in the middle of a navigation or downloading operation.
R	Container (see page 746)	Provides access to the automation interface of the Web browser's container.
R	Document (see page 746)	Provides access to the Automation interface of the active document.
R	FullName (see page 783)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 783)	This is FullScreen, a member of class IWebBrowserApp.
	Height (see page 746)	Specifies the object height in pixels.
R	HWnd (see page 783)	This is HWnd, a member of class IWebBrowserApp.
	Left (see page 747)	Specifies the X axis coordinate of the left edge of the window.
R	LocationName (see page 747)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 747)	Identifies the URL or path of the document or folder currently displayed.
	MenuBar (see page 783)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 784)	This is Name, a member of class IWebBrowserApp.
R	Parent (see page 748)	Provides access to the Automation interface of the Web browser's container.
R	Path (see page 784)	This is Path, a member of class IWebBrowserApp.
	StatusBar (see page 784)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 784)	This is StatusText, a member of class IWebBrowserApp.
	ToolBar (see page 785)	This is ToolBar, a member of class IWebBrowserApp.
	Top (see page 748)	Specifies the Y axis coordinate of the upper edge of the window.
R	TopLevelContainer (see page 748)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 749)	Indicates the type name of the contained document object.
	Visible (see page 785)	This is Visible, a member of class IWebBrowserApp.
	Width (see page 749)	Specifies the object width in pixels.

8.2.29.2 IWebBrowserApp Methods

The methods of the IWebBrowserApp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 778)	This is ClientToWindow, a member of class IWebBrowserApp.
	Get_FullName (see page 778)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 779)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_HWnd (see page 779)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_MenuBar (see page 779)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 779)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Path (see page 779)	This is Get_Path, a member of class IWebBrowserApp.
	Get_StatusBar (see page 780)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 780)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_ToolBar (see page 780)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Visible (see page 780)	This is Get_Visible, a member of class IWebBrowserApp.
	GetProperty (see page 781)	This is GetProperty, a member of class IWebBrowserApp.
	PutProperty (see page 781)	This is PutProperty, a member of class IWebBrowserApp.
	Quit (see page 781)	This is Quit, a member of class IWebBrowserApp.
	Set_FullScreen (see page 781)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_MenuBar (see page 781)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_StatusBar (see page 782)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 782)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_ToolBar (see page 782)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Visible (see page 782)	This is Set_Visible, a member of class IWebBrowserApp.

8.2.29.2.1 IWebBrowserApp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT); safecall;
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowserApp.

8.2.29.2.2 IWebBrowserApp.Get_FullName Method

Pascal

```
function Get_FullName: WideString; safecall;
```

C++

```
__fastcall BSTR Get_FullName();
```

Description

This is Get_FullName, a member of class IWebBrowserApp.

8.2.29.2.3 IWebBrowserApp.Get_FullScreen Method

Pascal

```
function Get_FullScreen: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_FullScreen();
```

Description

This is Get_FullScreen, a member of class IWebBrowserApp.

8.2.29.2.4 IWebBrowserApp.Get_HWnd Method

Pascal

```
function Get_HWnd: Integer; safecall;
```

C++

```
__fastcall int Get_HWnd();
```

Description

This is Get_HWnd, a member of class IWebBrowserApp.

8.2.29.2.5 IWebBrowserApp.Get_MenuBar Method

Pascal

```
function Get_MenuBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_MenuBar();
```

Description

This is Get_MenuBar, a member of class IWebBrowserApp.

8.2.29.2.6 IWebBrowserApp.Get_Name Method

Pascal

```
function Get_Name: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Name();
```

Description

This is Get_Name, a member of class IWebBrowserApp.

8.2.29.2.7 IWebBrowserApp.Get_Path Method

Pascal

```
function Get_Path: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Path();
```

Description

This is Get_Path, a member of class IWebBrowserApp.

8.2.29.2.8 IWebBrowserApp.Get_StatusBar Method

Pascal

```
function Get_StatusBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_StatusBar();
```

Description

This is Get_StatusBar, a member of class IWebBrowserApp.

8.2.29.2.9 IWebBrowserApp.Get_StatusText Method

Pascal

```
function Get_StatusText: WideString; safecall;
```

C++

```
__fastcall BSTR Get_StatusText();
```

Description

This is Get_StatusText, a member of class IWebBrowserApp.

8.2.29.2.10 IWebBrowserApp.Get_ToolBar Method

Pascal

```
function Get_ToolBar: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_ToolBar();
```

Description

This is Get_ToolBar, a member of class IWebBrowserApp.

8.2.29.2.11 IWebBrowserApp.Get_Visible Method

Pascal

```
function Get_Visible: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Visible();
```

Description

This is Get_Visible, a member of class IWebBrowserApp.

8.2.29.2.12 IWebBrowserApp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowserApp.

8.2.29.2.13 IWebBrowserApp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant); safecall;
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowserApp.

8.2.29.2.14 IWebBrowserApp.Quit Method

Pascal

```
procedure Quit; safecall;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowserApp.

8.2.29.2.15 IWebBrowserApp.Set_FullScreen Method

Pascal

```
procedure Set_FullScreen(pbFullScreen: WordBool); safecall;
```

C++

```
__fastcall Set_FullScreen(WordBool pbFullScreen);
```

Description

This is Set_FullScreen, a member of class IWebBrowserApp.

8.2.29.2.16 IWebBrowserApp.Set_MenuBar Method

Pascal

```
procedure Set_MenuBar(Value: WordBool); safecall;
```

C++

```
__fastcall Set_MenuBar(WordBool Value);
```

Description

This is Set_MenuBar, a member of class IWebBrowserApp.

8.2.29.2.17 IWebBrowserApp.Set_StatusBar Method

Pascal

```
procedure Set_StatusBar(pBool: WordBool); safecall;
```

C++

```
__fastcall Set_StatusBar(WordBool pBool);
```

Description

This is Set_StatusBar, a member of class IWebBrowserApp.

8.2.29.2.18 IWebBrowserApp.Set_StatusText Method

Pascal

```
procedure Set_StatusText(const StatusText: WideString); safecall;
```

C++

```
__fastcall Set_StatusText(const BSTR StatusText);
```

Description

This is Set_StatusText, a member of class IWebBrowserApp.

8.2.29.2.19 IWebBrowserApp.Set_ToolBar Method

Pascal

```
procedure Set_ToolBar(Value: SYSINT); safecall;
```

C++

```
__fastcall Set_ToolBar(SYSINT Value);
```

Description

This is Set_ToolBar, a member of class IWebBrowserApp.

8.2.29.2.20 IWebBrowserApp.Set_Visible Method

Pascal

```
procedure Set_Visible(pBool: WordBool); safecall;
```

C++

```
__fastcall Set_Visible(WordBool pBool);
```

Description

This is Set_Visible, a member of class IWebBrowserApp.

8.2.29.3 IWebBrowserApp Properties

The properties of the IWebBrowserApp class are listed here.

Public Properties

	Name	Description
R	FullName (see page 783)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 783)	This is FullScreen, a member of class IWebBrowserApp.
R	HWnd (see page 783)	This is HWnd, a member of class IWebBrowserApp.
	MenuBar (see page 783)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 784)	This is Name, a member of class IWebBrowserApp.
R	Path (see page 784)	This is Path, a member of class IWebBrowserApp.
	StatusBar (see page 784)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 784)	This is StatusText, a member of class IWebBrowserApp.
	ToolBar (see page 785)	This is ToolBar, a member of class IWebBrowserApp.
	Visible (see page 785)	This is Visible, a member of class IWebBrowserApp.

8.2.29.3.1 IWebBrowserApp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowserApp.

8.2.29.3.2 IWebBrowserApp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowserApp.

8.2.29.3.3 IWebBrowserApp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowserApp.

8.2.29.3.4 IWebBrowserApp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowserApp.

8.2.29.3.5 IWebBrowserApp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowserApp.

8.2.29.3.6 IWebBrowserApp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowserApp.

8.2.29.3.7 IWebBrowserApp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowserApp.

8.2.29.3.8 IWebBrowserApp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowserApp.

8.2.29.3.9 IWebBrowserApp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowserApp.

8.2.29.3.10 IWebBrowserApp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowserApp.

8.2.30 IWebBrowserAppDisp Interface

Class Hierarchy

Pascal

```
IWebBrowserAppDisp = dispinterface;
```

C++

```
class IWebBrowserAppDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserAppDisp.

8.2.30.1 IWebBrowserAppDisp Members

The following tables list the members exposed by IWebBrowserAppDisp.

Public Methods

	Name	Description
	ClientToWindow (see page 787)	This is ClientToWindow, a member of class IWebBrowserAppDisp.
	GetProperty (see page 787)	This is GetProperty, a member of class IWebBrowserAppDisp.
	GoBack (see page 787)	This is GoBack, a member of class IWebBrowserAppDisp.

	GoForward (see page 787)	This is GoForward, a member of class IWebBrowserAppDisp.
	GoHome (see page 787)	This is GoHome, a member of class IWebBrowserAppDisp.
	GoSearch (see page 788)	This is GoSearch, a member of class IWebBrowserAppDisp.
	Navigate (see page 788)	This is Navigate, a member of class IWebBrowserAppDisp.
	PutProperty (see page 788)	This is PutProperty, a member of class IWebBrowserAppDisp.
	Quit (see page 788)	This is Quit, a member of class IWebBrowserAppDisp.
	Refresh (see page 789)	This is Refresh, a member of class IWebBrowserAppDisp.
	Refresh2 (see page 789)	This is Refresh2, a member of class IWebBrowserAppDisp.
	Stop (see page 789)	This is Stop, a member of class IWebBrowserAppDisp.

Public Properties

	Name	Description
	Application (see page 790)	This is Application, a member of class IWebBrowserAppDisp.
	Busy (see page 790)	This is Busy, a member of class IWebBrowserAppDisp.
	Container (see page 790)	This is Container, a member of class IWebBrowserAppDisp.
	Document (see page 790)	This is Document, a member of class IWebBrowserAppDisp.
	FullName (see page 791)	This is FullName, a member of class IWebBrowserAppDisp.
	FullScreen (see page 791)	This is FullScreen, a member of class IWebBrowserAppDisp.
	Height (see page 791)	This is Height, a member of class IWebBrowserAppDisp.
	HWnd (see page 791)	This is HWnd, a member of class IWebBrowserAppDisp.
	Left (see page 792)	This is Left, a member of class IWebBrowserAppDisp.
	LocationName (see page 792)	This is LocationName, a member of class IWebBrowserAppDisp.
	LocationURL (see page 792)	This is LocationURL, a member of class IWebBrowserAppDisp.
	MenuBar (see page 792)	This is MenuBar, a member of class IWebBrowserAppDisp.
	Name (see page 792)	This is Name, a member of class IWebBrowserAppDisp.
	Parent (see page 793)	This is Parent, a member of class IWebBrowserAppDisp.
	Path (see page 793)	This is Path, a member of class IWebBrowserAppDisp.
	StatusBar (see page 793)	This is StatusBar, a member of class IWebBrowserAppDisp.
	StatusText (see page 793)	This is StatusText, a member of class IWebBrowserAppDisp.
	ToolBar (see page 794)	This is ToolBar, a member of class IWebBrowserAppDisp.
	Top (see page 794)	This is Top, a member of class IWebBrowserAppDisp.
	TopLevelContainer (see page 794)	This is TopLevelContainer, a member of class IWebBrowserAppDisp.
	type_ (see page 794)	This is type_, a member of class IWebBrowserAppDisp.
	Visible (see page 794)	This is Visible, a member of class IWebBrowserAppDisp.
	Width (see page 795)	This is Width, a member of class IWebBrowserAppDisp.

8.2.30.2 IWebBrowserAppDisp Methods

The methods of the IWebBrowserAppDisp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 787)	This is ClientToWindow, a member of class IWebBrowserAppDisp.
	GetProperty (see page 787)	This is GetProperty, a member of class IWebBrowserAppDisp.
	GoBack (see page 787)	This is GoBack, a member of class IWebBrowserAppDisp.
	GoForward (see page 787)	This is GoForward, a member of class IWebBrowserAppDisp.
	GoHome (see page 787)	This is GoHome, a member of class IWebBrowserAppDisp.
	GoSearch (see page 788)	This is GoSearch, a member of class IWebBrowserAppDisp.
	Navigate (see page 788)	This is Navigate, a member of class IWebBrowserAppDisp.
	PutProperty (see page 788)	This is PutProperty, a member of class IWebBrowserAppDisp.
	Quit (see page 788)	This is Quit, a member of class IWebBrowserAppDisp.
	Refresh (see page 789)	This is Refresh, a member of class IWebBrowserAppDisp.
	Refresh2 (see page 789)	This is Refresh2, a member of class IWebBrowserAppDisp.

	Stop (see page 789)	This is Stop, a member of class IWebBrowserAppDisp.

8.2.30.2.1 IWebBrowserAppDisp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowserAppDisp.

8.2.30.2.2 IWebBrowserAppDisp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowserAppDisp.

8.2.30.2.3 IWebBrowserAppDisp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowserAppDisp.

8.2.30.2.4 IWebBrowserAppDisp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowserAppDisp.

8.2.30.2.5 IWebBrowserAppDisp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowserAppDisp.

8.2.30.2.6 IWebBrowserAppDisp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowserAppDisp.

8.2.30.2.7 IWebBrowserAppDisp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowserAppDisp.

8.2.30.2.8 IWebBrowserAppDisp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowserAppDisp.

8.2.30.2.9 IWebBrowserAppDisp.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowserAppDisp.

8.2.30.2.10 IWebBrowserAppDisp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowserAppDisp.

8.2.30.2.11 IWebBrowserAppDisp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowserAppDisp.

8.2.30.2.12 IWebBrowserAppDisp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowserAppDisp.

8.2.30.3 IWebBrowserAppDisp Properties

The properties of the IWebBrowserAppDisp class are listed here.

Public Properties

	Name	Description
	Application (see page 790)	This is Application, a member of class IWebBrowserAppDisp.
	Busy (see page 790)	This is Busy, a member of class IWebBrowserAppDisp.
	Container (see page 790)	This is Container, a member of class IWebBrowserAppDisp.
	Document (see page 790)	This is Document, a member of class IWebBrowserAppDisp.
	FullName (see page 791)	This is FullName, a member of class IWebBrowserAppDisp.
	FullScreen (see page 791)	This is FullScreen, a member of class IWebBrowserAppDisp.
	Height (see page 791)	This is Height, a member of class IWebBrowserAppDisp.
	HWnd (see page 791)	This is HWnd, a member of class IWebBrowserAppDisp.
	Left (see page 792)	This is Left, a member of class IWebBrowserAppDisp.
	LocationName (see page 792)	This is LocationName, a member of class IWebBrowserAppDisp.
	LocationURL (see page 792)	This is LocationURL, a member of class IWebBrowserAppDisp.
	MenuBar (see page 792)	This is MenuBar, a member of class IWebBrowserAppDisp.

	Name (see page 792)	This is Name, a member of class IWebBrowserAppDisp.
	Parent (see page 793)	This is Parent, a member of class IWebBrowserAppDisp.
	Path (see page 793)	This is Path, a member of class IWebBrowserAppDisp.
	StatusBar (see page 793)	This is StatusBar, a member of class IWebBrowserAppDisp.
	StatusText (see page 793)	This is StatusText, a member of class IWebBrowserAppDisp.
	ToolBar (see page 794)	This is ToolBar, a member of class IWebBrowserAppDisp.
	Top (see page 794)	This is Top, a member of class IWebBrowserAppDisp.
	TopLevelContainer (see page 794)	This is TopLevelContainer, a member of class IWebBrowserAppDisp.
	type_ (see page 794)	This is type_, a member of class IWebBrowserAppDisp.
	Visible (see page 794)	This is Visible, a member of class IWebBrowserAppDisp.
	Width (see page 795)	This is Width, a member of class IWebBrowserAppDisp.

8.2.30.3.1 IWebBrowserAppDisp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowserAppDisp.

8.2.30.3.2 IWebBrowserAppDisp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowserAppDisp.

8.2.30.3.3 IWebBrowserAppDisp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowserAppDisp.

8.2.30.3.4 IWebBrowserAppDisp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowserAppDisp.

8.2.30.3.5 IWebBrowserAppDisp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowserAppDisp.

8.2.30.3.6 IWebBrowserAppDisp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowserAppDisp.

8.2.30.3.7 IWebBrowserAppDisp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowserAppDisp.

8.2.30.3.8 IWebBrowserAppDisp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowserAppDisp.

8.2.30.3.9 IWebBrowserAppDisp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowserAppDisp.

8.2.30.3.10 IWebBrowserAppDisp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowserAppDisp.

8.2.30.3.11 IWebBrowserAppDisp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowserAppDisp.

8.2.30.3.12 IWebBrowserAppDisp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowserAppDisp.

8.2.30.3.13 IWebBrowserAppDisp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowserAppDisp.

8.2.30.3.14 IWebBrowserAppDisp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowserAppDisp.

8.2.30.3.15 IWebBrowserAppDisp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowserAppDisp.

8.2.30.3.16 IWebBrowserAppDisp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowserAppDisp.

8.2.30.3.17 IWebBrowserAppDisp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowserAppDisp.

8.2.30.3.18 IWebBrowserAppDisp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowserAppDisp.

8.2.30.3.19 IWebBrowserAppDisp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowserAppDisp.

8.2.30.3.20 IWebBrowserAppDisp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowserAppDisp.

8.2.30.3.21 IWebBrowserAppDisp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowserAppDisp.

8.2.30.3.22 IWebBrowserAppDisp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowserAppDisp.

8.2.30.3.23 IWebBrowserAppDisp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowserAppDisp.

8.2.31 IWebBrowserDisp Interface

Class Hierarchy

Pascal

```
IWebBrowserDisp = dispinterface;
```

C++

```
class IWebBrowserDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserDisp.

8.2.31.1 IWebBrowserDisp Members

The following tables list the members exposed by IWebBrowserDisp.

Public Methods

	Name	Description
	GoBack (see page 796)	This is GoBack, a member of class IWebBrowserDisp.
	GoForward (see page 796)	This is GoForward, a member of class IWebBrowserDisp.
	GoHome (see page 797)	This is GoHome, a member of class IWebBrowserDisp.
	GoSearch (see page 797)	This is GoSearch, a member of class IWebBrowserDisp.
	Navigate (see page 797)	This is Navigate, a member of class IWebBrowserDisp.
	Refresh (see page 797)	This is Refresh, a member of class IWebBrowserDisp.
	Refresh2 (see page 797)	This is Refresh2, a member of class IWebBrowserDisp.
	Stop (see page 798)	This is Stop, a member of class IWebBrowserDisp.

Public Properties

	Name	Description
	Application (see page 798)	This is Application, a member of class IWebBrowserDisp.

	Busy (see page 799)	This is Busy, a member of class IWebBrowserDisp.
	Container (see page 799)	This is Container, a member of class IWebBrowserDisp.
	Document (see page 799)	This is Document, a member of class IWebBrowserDisp.
	Height (see page 799)	This is Height, a member of class IWebBrowserDisp.
	Left (see page 799)	This is Left, a member of class IWebBrowserDisp.
	LocationName (see page 800)	This is LocationName, a member of class IWebBrowserDisp.
	LocationURL (see page 800)	This is LocationURL, a member of class IWebBrowserDisp.
	Parent (see page 800)	This is Parent, a member of class IWebBrowserDisp.
	Top (see page 800)	This is Top, a member of class IWebBrowserDisp.
	TopLevelContainer (see page 801)	This is TopLevelContainer, a member of class IWebBrowserDisp.
	type_ (see page 801)	This is type_, a member of class IWebBrowserDisp.
	Width (see page 801)	This is Width, a member of class IWebBrowserDisp.

8.2.31.2 IWebBrowserDisp Methods

The methods of the IWebBrowserDisp class are listed here.

Public Methods

	Name	Description
	GoBack (see page 796)	This is GoBack, a member of class IWebBrowserDisp.
	GoForward (see page 796)	This is GoForward, a member of class IWebBrowserDisp.
	GoHome (see page 797)	This is GoHome, a member of class IWebBrowserDisp.
	GoSearch (see page 797)	This is GoSearch, a member of class IWebBrowserDisp.
	Navigate (see page 797)	This is Navigate, a member of class IWebBrowserDisp.
	Refresh (see page 797)	This is Refresh, a member of class IWebBrowserDisp.
	Refresh2 (see page 797)	This is Refresh2, a member of class IWebBrowserDisp.
	Stop (see page 798)	This is Stop, a member of class IWebBrowserDisp.

8.2.31.2.1 IWebBrowserDisp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowserDisp.

8.2.31.2.2 IWebBrowserDisp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowserDisp.

8.2.31.2.3 IWebBrowserDisp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowserDisp.

8.2.31.2.4 IWebBrowserDisp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowserDisp.

8.2.31.2.5 IWebBrowserDisp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowserDisp.

8.2.31.2.6 IWebBrowserDisp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowserDisp.

8.2.31.2.7 IWebBrowserDisp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowserDisp.

8.2.31.2.8 IWebBrowserDisp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowserDisp.

8.2.31.3 IWebBrowserDisp Properties

The properties of the IWebBrowserDisp class are listed here.

Public Properties

	Name	Description
	Application (see page 798)	This is Application, a member of class IWebBrowserDisp.
	Busy (see page 799)	This is Busy, a member of class IWebBrowserDisp.
	Container (see page 799)	This is Container, a member of class IWebBrowserDisp.
	Document (see page 799)	This is Document, a member of class IWebBrowserDisp.
	Height (see page 799)	This is Height, a member of class IWebBrowserDisp.
	Left (see page 799)	This is Left, a member of class IWebBrowserDisp.
	LocationName (see page 800)	This is LocationName, a member of class IWebBrowserDisp.
	LocationURL (see page 800)	This is LocationURL, a member of class IWebBrowserDisp.
	Parent (see page 800)	This is Parent, a member of class IWebBrowserDisp.
	Top (see page 800)	This is Top, a member of class IWebBrowserDisp.
	TopLevelContainer (see page 801)	This is TopLevelContainer, a member of class IWebBrowserDisp.
	type_ (see page 801)	This is type_, a member of class IWebBrowserDisp.
	Width (see page 801)	This is Width, a member of class IWebBrowserDisp.

8.2.31.3.1 IWebBrowserDisp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowserDisp.

8.2.31.3.2 IWebBrowserDisp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowserDisp.

8.2.31.3.3 IWebBrowserDisp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowserDisp.

8.2.31.3.4 IWebBrowserDisp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowserDisp.

8.2.31.3.5 IWebBrowserDisp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowserDisp.

8.2.31.3.6 IWebBrowserDisp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowserDisp.

8.2.31.3.7 IWebBrowserDisp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowserDisp.

8.2.31.3.8 IWebBrowserDisp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowserDisp.

8.2.31.3.9 IWebBrowserDisp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowserDisp.

8.2.31.3.10 IWebBrowserDisp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowserDisp.

8.2.31.3.11 IWebBrowserDisp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowserDisp.

8.2.31.3.12 IWebBrowserDisp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowserDisp.

8.2.31.3.13 IWebBrowserDisp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowserDisp.

8.3 Types

The following table lists types in this documentation.

Types

Name	Description
BrowserNavConstants (see page 804)	This is type SHDocVw.BrowserNavConstants.
CommandStateChangeConstants (see page 804)	Represents an alias for TOleEnum.
CScriptErrorList (see page 804)	This is type SHDocVw.CScriptErrorList.
InternetExplorer (see page 805)	This is type SHDocVw.InternetExplorer.
OLECMDEXECOPT (see page 805)	OLECMDF (see page 806) influences the way in which an OLECMDID (see page 806) command is executed.
OLECMDF (see page 806)	OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.
OLECMDID (see page 806)	OLECMDID represents a command that can be executed by an Automation object.
POleVariant1 (see page 807)	POleVariant1 is a pointer to a System::OleVariant (see page 3274) variable.
RefreshConstants (see page 807)	This is type SHDocVw.RefreshConstants.
SearchAssistantOC (see page 808)	This is type SHDocVw.SearchAssistantOC.
SecureLockIconConstants (see page 808)	This is type SHDocVw.SecureLockIconConstants.
ShellBrowserWindow (see page 808)	This is type SHDocVw.ShellBrowserWindow.
ShellNameSpace (see page 809)	This is type SHDocVw.ShellNameSpace.
ShellUIHelper (see page 809)	This is type SHDocVw.ShellUIHelper.
ShellWindowFindWindowOptions (see page 809)	This is type SHDocVw.ShellWindowFindWindowOptions.
ShellWindows (see page 810)	This is type SHDocVw.ShellWindows.
ShellWindowTypeConstants (see page 810)	This is type SHDocVw.ShellWindowTypeConstants.
tagREADYSTATE (see page 810)	This is type SHDocVw.tagREADYSTATE.
TInternetExplorerBeforeNavigate2 (see page 811)	This is type SHDocVw.TInternetExplorerBeforeNavigate2.
TInternetExplorerClientToHostWindow (see page 811)	This is type SHDocVw.TInternetExplorerClientToHostWindow.
TInternetExplorerCommandStateChange (see page 811)	This is type SHDocVw.TInternetExplorerCommandStateChange.
TInternetExplorerDocumentComplete (see page 812)	This is type SHDocVw.TInternetExplorerDocumentComplete.
TInternetExplorerFileDownload (see page 812)	This is type SHDocVw.TInternetExplorerFileDownload.
TInternetExplorerNavigateComplete2 (see page 812)	This is type SHDocVw.TInternetExplorerNavigateComplete2.
TInternetExplorerNavigateError (see page 813)	This is type SHDocVw.TInternetExplorerNavigateError.
TInternetExplorerNewWindow2 (see page 813)	This is type SHDocVw.TInternetExplorerNewWindow2.
TInternetExplorerOnFullScreen (see page 813)	This is type SHDocVw.TInternetExplorerOnFullScreen.
TInternetExplorerOnMenuBar (see page 814)	This is type SHDocVw.TInternetExplorerOnMenuBar.
TInternetExplorerOnStatusBar (see page 814)	This is type SHDocVw.TInternetExplorerOnStatusBar.
TInternetExplorerOnTheaterMode (see page 814)	This is type SHDocVw.TInternetExplorerOnTheaterMode.
TInternetExplorerOnToolBar (see page 815)	This is type SHDocVw.TInternetExplorerOnToolBar.
TInternetExplorerOnVisible (see page 815)	This is type SHDocVw.TInternetExplorerOnVisible.
TInternetExplorerPrintTemplateInstantiation (see page 815)	This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.
TInternetExplorerPrintTemplateTeardown (see page 816)	This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.
TInternetExplorerPrivacyImpactedStateChange (see page 816)	This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.
TInternetExplorerProgressChange (see page 816)	This is type SHDocVw.TInternetExplorerProgressChange.
TInternetExplorerPropertyChange (see page 817)	This is type SHDocVw.TInternetExplorerPropertyChange.
TInternetExplorerSetSecureLockIcon (see page 817)	This is type SHDocVw.TInternetExplorerSetSecureLockIcon.
TInternetExplorerStatusTextChange (see page 817)	This is type SHDocVw.TInternetExplorerStatusTextChange.
TInternetExplorerTitleChange (see page 818)	This is type SHDocVw.TInternetExplorerTitleChange.
TInternetExplorerUpdatePageStatus (see page 818)	This is type SHDocVw.TInternetExplorerUpdatePageStatus.
TInternetExplorerWindowClosing (see page 818)	This is type SHDocVw.TInternetExplorerWindowClosing.

TInternetExplorerWindowSetHeight (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetHeight.
TInternetExplorerWindowSetLeft (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetLeft.
TInternetExplorerWindowSetResizable (see page 819)	This is type SHDocVw.TInternetExplorerWindowSetResizable.
TInternetExplorerWindowSetTop (see page 820)	This is type SHDocVw.TInternetExplorerWindowSetTop.
TInternetExplorerWindowSetWidth (see page 820)	This is type SHDocVw.TInternetExplorerWindowSetWidth.
TShellNameSpaceFavoritesSelectionChange (see page 820)	This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.
TShellWindowsWindowRegistered (see page 821)	This is type SHDocVw.TShellWindowsWindowRegistered.
TShellWindowsWindowRevoked (see page 821)	This is type SHDocVw.TShellWindowsWindowRevoked.
TWebBrowser_V1BeforeNavigate (see page 821)	This is type SHDocVw.TWebBrowser_V1BeforeNavigate.
TWebBrowser_V1CommandStateChange (see page 822)	This is type SHDocVw.TWebBrowser_V1CommandStateChange.
TWebBrowser_V1FrameBeforeNavigate (see page 822)	This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.
TWebBrowser_V1FrameNavigateComplete (see page 823)	This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.
TWebBrowser_V1FrameNewWindow (see page 823)	This is type SHDocVw.TWebBrowser_V1FrameNewWindow.
TWebBrowser_V1NavigateComplete (see page 823)	This is type SHDocVw.TWebBrowser_V1NavigateComplete.
TWebBrowser_V1NewWindow (see page 824)	This is type SHDocVw.TWebBrowser_V1NewWindow.
TWebBrowser_V1ProgressChange (see page 824)	This is type SHDocVw.TWebBrowser_V1ProgressChange.
TWebBrowser_V1PropertyChange (see page 824)	This is type SHDocVw.TWebBrowser_V1PropertyChange.
TWebBrowser_V1Quit (see page 825)	This is type SHDocVw.TWebBrowser_V1Quit.
TWebBrowser_V1StatusTextChange (see page 825)	This is type SHDocVw.TWebBrowser_V1StatusTextChange.
TWebBrowser_V1TitleChange (see page 825)	This is type SHDocVw.TWebBrowser_V1TitleChange.
TWebBrowserBeforeNavigate2 (see page 826)	TWebBrowserBeforeNavigate2 is the type for the BeforeNavigate2 event handler on TWebBrowser (see page 504).
TWebBrowserClientToHostWindow (see page 826)	This is type SHDocVw.TWebBrowserClientToHostWindow.
TWebBrowserCommandStateChange (see page 827)	TWebBrowserCommandStateChange is the type for the OnCommandStateChange event handler on TWebBrowser (see page 504).
TWebBrowserDocumentComplete (see page 827)	TWebBrowserDocumentComplete is the type for event handlers that respond when the Service Control manager stops a service.
TWebBrowserFileDownload (see page 828)	This is type SHDocVw.TWebBrowserFileDownload.
TWebBrowserNavigateComplete2 (see page 828)	TWebBrowserNavigateComplete2 is the type for the OnNavigateComplete2 event handler on TWebBrowser (see page 504).
TWebBrowserNavigateError (see page 829)	This is type SHDocVw.TWebBrowserNavigateError.
TWebBrowserNewWindow2 (see page 829)	TWebBrowserNewWindow2 is the type for the OnNewWindow2 event handler on TWebBrowser (see page 504).
TWebBrowserOnFullScreen (see page 830)	This is type SHDocVw.TWebBrowserOnFullScreen.
TWebBrowserOnMenuBar (see page 830)	This is type SHDocVw.TWebBrowserOnMenuBar.
TWebBrowserOnStatusBar (see page 830)	This is type SHDocVw.TWebBrowserOnStatusBar.
TWebBrowserOnTheaterMode (see page 831)	This is type SHDocVw.TWebBrowserOnTheaterMode.
TWebBrowserOnToolBar (see page 831)	This is type SHDocVw.TWebBrowserOnToolBar.
TWebBrowserOnVisible (see page 831)	TWebBrowserOnVisible is the type for the OnVisible event handler on TWebBrowser (see page 504).
TWebBrowserPrintTemplateInstantiation (see page 832)	This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.
TWebBrowserPrintTemplateTeardown (see page 832)	This is type SHDocVw.TWebBrowserPrintTemplateTeardown.
TWebBrowserPrivacyImpactedStateChange (see page 832)	This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.
TWebBrowserProgressChange (see page 833)	TWebBrowserProgressChange is the type for the OnProgressChange event handler on TWebBrowser (see page 504).
TWebBrowserPropertyChange (see page 833)	This is type SHDocVw.TWebBrowserPropertyChange.
TWebBrowserSetSecureLockIcon (see page 834)	This is type SHDocVw.TWebBrowserSetSecureLockIcon.
TWebBrowserStatusTextChange (see page 834)	This is type SHDocVw.TWebBrowserStatusTextChange.
TWebBrowserTitleChange (see page 834)	TWebBrowserTitleChange is the type for the OnTitleChange event handler on TWebBrowser (see page 504).
TWebBrowserUpdatePageStatus (see page 835)	This is type SHDocVw.TWebBrowserUpdatePageStatus.
TWebBrowserWindowClosing (see page 835)	This is type SHDocVw.TWebBrowserWindowClosing.
TWebBrowserWindowSetHeight (see page 835)	This is type SHDocVw.TWebBrowserWindowSetHeight.
TWebBrowserWindowSetLeft (see page 836)	This is type SHDocVw.TWebBrowserWindowSetLeft.
TWebBrowserWindowSetResizable (see page 836)	This is type SHDocVw.TWebBrowserWindowSetResizable.
TWebBrowserWindowSetTop (see page 836)	This is type SHDocVw.TWebBrowserWindowSetTop.
TWebBrowserWindowSetWidth (see page 837)	This is type SHDocVw.TWebBrowserWindowSetWidth.

WebBrowser (see page 837)	This is type SHDocVw.WebBrowser.
WebBrowser_V1 (see page 837)	This is type SHDocVw.WebBrowser_V1.

8.3.1 SHDocVw.BrowserNavConstants Type

Pascal

```
BrowserNavConstants = TOleEnum;
```

C++

```
TOleEnum BrowserNavConstants;
```

File

SHDocVw

Description

This is type SHDocVw.BrowserNavConstants.

8.3.2 SHDocVw.CommandStateChangeConstants Type

Represents an alias for TOleEnum.

Pascal

```
CommandStateChangeConstants = TOleEnum;
```

C++

```
TOleEnum CommandStateChangeConstants;
```

File

SHDocVw

Description

CommandStateChangeConstants is used by the IWebBrowser (see page 733) interface for sending update, forward and back commands.

See Also

TOleEnum

CSC_UPDATECOMMANDS (see page 844)

CSC_NAVIGATEFORWARD (see page 844)

CSC_NAVIGATEBACK (see page 844)

8.3.3 SHDocVw.CScriptErrorList Type

Pascal

```
CScriptErrorList = IScriptErrorList;
```

C++

```
IScriptErrorList CScriptErrorList;
```

File

SHDocVw

Description

This is type SHDocVw.CScriptErrorList.

8.3.4 SHDocVw.InternetExplorer Type

Pascal

```
InternetExplorer = IWebBrowser2;
```

C++

```
IWebBrowser2 InternetExplorer;
```

File

SHDocVw

Description

This is type SHDocVw.InternetExplorer.

8.3.5 SHDocVw.OLECMDEXECOPT Type

OLECMDF (see page 806) influences the way in which an OLECMDID (see page 806) command is executed.

Pascal

```
OLECMDEXECOPT = TOleEnum;
```

C++

```
TOleEnum OLECMDEXECOPT;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDEXECOPT indicates what an Automation object should do in response to an OLECMDID (see page 806) command. The following table lists the possible values:

Constant	Value	Meaning
OLECMDEXECOPT_DODEFAULT (see page 855)	0	Use the default behavior, whether prompting the user for input or not.
OLECMDEXECOPT_PROMPTUSER (see page 855)	1	Execute the command after obtaining user input.
OLECMDEXECOPT_DONTPROMPTUSER (see page 855)	2	Execute the command without prompting the user.

OLECMDEXECOPT_SHOWHELP (see page 856)	3	Show help for the command, but do not execute it.

See Also

OLECMDID (see page 806)

8.3.6 SHDocVw.OLECMDF Type

OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.

Pascal

```
OLECMDF = TOleEnum;
```

C++

```
TOleEnum OLECMDF;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDF is a set of flags that together indicate how a command can be used. These values can be or'd together:

Value	Meaning	
OLECMDF_SUPPORTED (see page 858)	The Automation object supports the command (but it may not be enabled).	
OLECMDF_ENABLED (see page 856)	The command is currently enabled.	
OLECMDF_LATCHED (see page 857)	The command is an on/off toggle that is currently on.	
OLECMDF_NINCHED (see page 857)	Not currently used.	
OLECMDF_INVISIBLE (see page 857)	Not currently used.	
OLECMDF_DEFHIDEONCTXTMENU (see page 856)	Not currently used.	

See Also

OLECMDID (see page 806)

8.3.7 SHDocVw.OLECMDID Type

OLECMDID represents a command that can be executed by an Automation object.

Pascal

```
OLECMDID = TOleEnum;
```

C++

```
TOleEnum OLECMDID;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDID represents a set of standard commands that can be executed by many Automation objects. Typically, each command represents a command in the user interface of the Automation object, such as a menu command. For specific details on how the Automation object interprets a particular command, see the documentation for the Automation object.

See Also

OLECMDEXECOPT (see page 805)

8.3.8 SHDocVw.POleVariant1 Type

POleVariant1 is a pointer to a System::OleVariant (see page 3274) variable.

Pascal

```
POleVariant1 = ^OleVariant;
```

C++

```
^OleVariant POleVariant1;
```

File

SHDocVw

Description

POleVariant1 is a pointer to a System::OleVariant (see page 3274) variable.

See Also

System::OleVariant (see page 3274)

POleVariant (see page 3770)

8.3.9 SHDocVw.RefreshConstants Type

Pascal

```
RefreshConstants = TOleEnum;
```

C++

```
TOleEnum RefreshConstants;
```

File

SHDocVw

Description

This is type SHDocVw.RefreshConstants.

8.3.10 SHDocVw.SearchAssistantOC Type

Pascal

```
SearchAssistantOC = ISearchAssistantOC3;
```

C++

```
ISearchAssistantOC3 SearchAssistantOC;
```

File

SHDocVw

Description

This is type SHDocVw.SearchAssistantOC.

8.3.11 SHDocVw.SecureLockIconConstants Type

Pascal

```
SecureLockIconConstants = TOleEnum;
```

C++

```
TOleEnum SecureLockIconConstants;
```

File

SHDocVw

Description

This is type SHDocVw.SecureLockIconConstants.

8.3.12 SHDocVw.ShellBrowserWindow Type

Pascal

```
ShellBrowserWindow = IWebBrowser2;
```

C++

```
IWebBrowser2 ShellBrowserWindow;
```

File

SHDocVw

Description

This is type SHDocVw.ShellBrowserWindow.

8.3.13 SHDocVw.ShellNameSpace Type

Pascal

```
ShellNameSpace = IShellNameSpace;
```

C++

```
IShellNameSpace ShellNameSpace;
```

File

SHDocVw

Description

This is type SHDocVw.ShellNameSpace.

8.3.14 SHDocVw.ShellUIHelper Type

Pascal

```
ShellUIHelper = IShellUIHelper;
```

C++

```
IShellUIHelper ShellUIHelper;
```

File

SHDocVw

Description

This is type SHDocVw.ShellUIHelper.

8.3.15 SHDocVw.ShellWindowFindWindowOptions Type

Pascal

```
ShellWindowFindWindowOptions = TOleEnum;
```

C++

```
TOleEnum ShellWindowFindWindowOptions;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindowFindWindowOptions.

8.3.16 SHDocVw.ShellWindows Type

Pascal

```
ShellWindows = IShellWindows;
```

C++

```
IShellWindows ShellWindows;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindows.

8.3.17 SHDocVw.ShellWindowTypeConstants Type

Pascal

```
ShellWindowTypeConstants = TOleEnum;
```

C++

```
TOleEnum ShellWindowTypeConstants;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindowTypeConstants.

8.3.18 SHDocVw.tagREADYSTATE Type

Pascal

```
tagREADYSTATE = TOleEnum;
```

C++

```
TOleEnum tagREADYSTATE;
```

File

SHDocVw

Description

This is type SHDocVw.tagREADYSTATE.

8.3.19 SHDocVw.TInternetExplorerBeforeNavigate2 Type

Pascal

```
TInternetExplorerBeforeNavigate2 = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant; var Flags: OleVariant; var TargetFrameName: OleVariant; var PostData:
OleVariant; var Headers: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Flags: OleVariant; var
TargetFrameName: OleVariant; var PostData: OleVariant; var Headers: OleVariant; var Cancel:
WordBool) ( TInternetExplorerBeforeNavigate2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerBeforeNavigate2.

8.3.20 SHDocVw.TInternetExplorerClientToHostWindow Type

Pascal

```
TInternetExplorerClientToHostWindow = procedure (ASender: TObject; var CX: Integer; var CY:
Integer) of object;
```

C++

```
(ASender: TObject; var CX: Integer; var CY: Integer) ( TInternetExplorerClientToHostWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerClientToHostWindow.

8.3.21 SHDocVw.TInternetExplorerCommandStateChange Type

Pascal

```
TInternetExplorerCommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) (
TInternetExplorerCommandStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerCommandStateChange.

8.3.22 SHDocVw.TInternetExplorerDocumentComplete Type

Pascal

```
TInternetExplorerDocumentComplete = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TInternetExplorerDocumentComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerDocumentComplete.

8.3.23 SHDocVw.TInternetExplorerFileDownload Type

Pascal

```
TInternetExplorerFileDownload = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TInternetExplorerFileDownload)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerFileDownload.

8.3.24 SHDocVw.TInternetExplorerNavigateComplete2 Type

Pascal

```
TInternetExplorerNavigateComplete2 = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TInternetExplorerNavigateComplete2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNavigateComplete2.

8.3.25 SHDocVw.TInternetExplorerNavigateError Type

Pascal

```
TInternetExplorerNavigateError = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Frame: OleVariant; var StatusCode: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant; var
StatusCode: OleVariant; var Cancel: WordBool) ( TInternetExplorerNavigateError)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNavigateError.

8.3.26 SHDocVw.TInternetExplorerNewWindow2 Type

Pascal

```
TInternetExplorerNewWindow2 = procedure (ASender: TObject; var ppDisp: IDispatch; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; var ppDisp: IDispatch; var Cancel: WordBool) (
TInternetExplorerNewWindow2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNewWindow2.

8.3.27 SHDocVw.TInternetExplorerOnFullScreen Type

Pascal

```
TInternetExplorerOnFullScreen = procedure (ASender: TObject; FullScreen: WordBool) of object;
```

C++

```
(ASender: TObject; FullScreen: WordBool) ( TInternetExplorerOnFullScreen)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnFullScreen.

8.3.28 SHDocVw.TInternetExplorerOnMenuBar Type

Pascal

```
TInternetExplorerOnMenuBar = procedure (ASender: TObject; MenuBar: WordBool) of object;
```

C++

```
(ASender: TObject; MenuBar: WordBool) ( TInternetExplorerOnMenuBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnMenuBar.

8.3.29 SHDocVw.TInternetExplorerOnStatusBar Type

Pascal

```
TInternetExplorerOnStatusBar = procedure (ASender: TObject; StatusBar: WordBool) of object;
```

C++

```
(ASender: TObject; StatusBar: WordBool) ( TInternetExplorerOnStatusBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnStatusBar.

8.3.30 SHDocVw.TInternetExplorerOnTheaterMode Type

Pascal

```
TInternetExplorerOnTheaterMode = procedure (ASender: TObject; TheaterMode: WordBool) of object;
```

C++

```
(ASender: TObject; TheaterMode: WordBool) ( TInternetExplorerOnTheaterMode)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnTheaterMode.

8.3.31 SHDocVw.TInternetExplorerOnToolBar Type

Pascal

```
TInternetExplorerOnToolBar = procedure (ASender: TObject; ToolBar: WordBool) of object;
```

C++

```
(ASender: TObject; ToolBar: WordBool) ( TInternetExplorerOnToolBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnToolBar.

8.3.32 SHDocVw.TInternetExplorerOnVisible Type

Pascal

```
TInternetExplorerOnVisible = procedure (ASender: TObject; Visible: WordBool) of object;
```

C++

```
(ASender: TObject; Visible: WordBool) ( TInternetExplorerOnVisible)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnVisible.

8.3.33 SHDocVw.TInternetExplorerPrintTemplateInstantiation Type

Pascal

```
TInternetExplorerPrintTemplateInstantiation = procedure (ASender: TObject; const pDisp:
IDispatch) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TInternetExplorerPrintTemplateInstantiation)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.

8.3.34 SHDocVw.TInternetExplorerPrintTemplateTeardown Type

Pascal

```
TInternetExplorerPrintTemplateTeardown = procedure (ASender: TObject; const pDisp: IDispatch)
of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TInternetExplorerPrintTemplateTeardown)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.

8.3.35 SHDocVw.TInternetExplorerPrivacyImpactedStateChange Type

Pascal

```
TInternetExplorerPrivacyImpactedStateChange = procedure (ASender: TObject; bImpacted:
WordBool) of object;
```

C++

```
(ASender: TObject; bImpacted: WordBool) ( TInternetExplorerPrivacyImpactedStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.

8.3.36 SHDocVw.TInternetExplorerProgressChange Type

Pascal

```
TInternetExplorerProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) (
TInternetExplorerProgressChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerProgressChange.

8.3.37 SHDocVw.TInternetExplorerPropertyChange Type

Pascal

```
TInternetExplorerPropertyChange = procedure (ASender: TObject; const szProperty: WideString)
of object;
```

C++

```
(ASender: TObject; const szProperty: WideString) ( TInternetExplorerPropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPropertyChange.

8.3.38 SHDocVw.TInternetExplorerSetSecureLockIcon Type

Pascal

```
TInternetExplorerSetSecureLockIcon = procedure (ASender: TObject; SecureLockIcon: Integer) of
object;
```

C++

```
(ASender: TObject; SecureLockIcon: Integer) ( TInternetExplorerSetSecureLockIcon)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerSetSecureLockIcon.

8.3.39 SHDocVw.TInternetExplorerStatusTextChange Type

Pascal

```
TInternetExplorerStatusTextChange = procedure (ASender: TObject; const Text: WideString) of
object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TInternetExplorerStatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerStatusTextChange.

8.3.40 SHDocVw.TInternetExplorerTitleChange Type

Pascal

```
TInternetExplorerTitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TInternetExplorerTitleChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerTitleChange.

8.3.41 SHDocVw.TInternetExplorerUpdatePageStatus Type

Pascal

```
TInternetExplorerUpdatePageStatus = procedure (ASender: TObject; const pDisp: IDispatch; var
nPage: OleVariant; var fDone: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var nPage: OleVariant; var fDone: OleVariant) (
TInternetExplorerUpdatePageStatus)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerUpdatePageStatus.

8.3.42 SHDocVw.TInternetExplorerWindowClosing Type

Pascal

```
TInternetExplorerWindowClosing = procedure (ASender: TObject; IsChildWindow: WordBool; var
Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; IsChildWindow: WordBool; var Cancel: WordBool) (
TInternetExplorerWindowClosing)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowClosing.

8.3.43 SHDocVw.TInternetExplorerWindowSetHeight Type

Pascal

```
TInternetExplorerWindowSetHeight = procedure (ASender: TObject; Height: Integer) of object;
```

C++

```
(ASender: TObject; Height: Integer) ( TInternetExplorerWindowSetHeight)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetHeight.

8.3.44 SHDocVw.TInternetExplorerWindowSetLeft Type

Pascal

```
TInternetExplorerWindowSetLeft = procedure (ASender: TObject; Left: Integer) of object;
```

C++

```
(ASender: TObject; Left: Integer) ( TInternetExplorerWindowSetLeft)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetLeft.

8.3.45 SHDocVw.TInternetExplorerWindowSetResizable Type

Pascal

```
TInternetExplorerWindowSetResizable = procedure (ASender: TObject; Resizable: WordBool) of
object;
```

C++

```
(ASender: TObject; Resizable: WordBool) ( TInternetExplorerWindowSetResizable)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetResizable.

8.3.46 SHDocVw.TInternetExplorerWindowSetTop Type

Pascal

```
TInternetExplorerWindowSetTop = procedure (ASender: TObject; Top: Integer) of object;
```

C++

```
(ASender: TObject; Top: Integer) ( TInternetExplorerWindowSetTop)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetTop.

8.3.47 SHDocVw.TInternetExplorerWindowSetWidth Type

Pascal

```
TInternetExplorerWindowSetWidth = procedure (ASender: TObject; Width: Integer) of object;
```

C++

```
(ASender: TObject; Width: Integer) ( TInternetExplorerWindowSetWidth)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetWidth.

8.3.48 SHDocVw.TShellNameSpaceFavoritesSelectionChange Type

Pascal

```
TShellNameSpaceFavoritesSelectionChange = procedure (ASender: TObject; cItems: Integer; hItem:
Integer; const strName: WideString; const strUrl: WideString; cVisits: Integer; const strDate:
WideString; fAvailableOffline: Integer) of object;
```

C++

```
(ASender: TObject; cItems: Integer; hItem: Integer; const strName: WideString; const strUrl:
WideString; cVisits: Integer; const strDate: WideString; fAvailableOffline: Integer) (
TShellNameSpaceFavoritesSelectionChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.

8.3.49 SHDocVw.TShellWindowsWindowRegistered Type

Pascal

```
TShellWindowsWindowRegistered = procedure (ASender: TObject; lCookie: Integer) of object;
```

C++

```
(ASender: TObject; lCookie: Integer) ( TShellWindowsWindowRegistered)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellWindowsWindowRegistered.

8.3.50 SHDocVw.TShellWindowsWindowRevoked Type

Pascal

```
TShellWindowsWindowRevoked = procedure (ASender: TObject; lCookie: Integer) of object;
```

C++

```
(ASender: TObject; lCookie: Integer) ( TShellWindowsWindowRevoked)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellWindowsWindowRevoked.

8.3.51 SHDocVw.TWebBrowser_V1BeforeNavigate Type

Pascal

```
TWebBrowser_V1BeforeNavigate = procedure (ASender: TObject; const URL: WideString; Flags:
Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers:
WideString; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool) (
TWebBrowser_V1BeforeNavigate)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1BeforeNavigate.

8.3.52 SHDocVw.TWebBrowser_V1CommandStateChange Type

Pascal

```
TWebBrowser_V1CommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) ( TWebBrowser_V1CommandStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1CommandStateChange.

8.3.53 SHDocVw.TWebBrowser_V1FrameBeforeNavigate Type

Pascal

```
TWebBrowser_V1FrameBeforeNavigate = procedure (ASender: TObject; const URL: WideString; Flags:
Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers:
WideString; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool) (
TWebBrowser_V1FrameBeforeNavigate)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.

8.3.54 SHDocVw.TWebBrowser_V1FrameNavigateComplete Type

Pascal

```
TWebBrowser_V1FrameNavigateComplete = procedure (ASender: TObject; const URL: WideString) of object;
```

C++

```
(ASender: TObject; const URL: WideString) ( TWebBrowser_V1FrameNavigateComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.

8.3.55 SHDocVw.TWebBrowser_V1FrameNewWindow Type

Pascal

```
TWebBrowser_V1FrameNewWindow = procedure (ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers: WideString; var Processed: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers: WideString; var Processed: WordBool) ( TWebBrowser_V1FrameNewWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameNewWindow.

8.3.56 SHDocVw.TWebBrowser_V1NavigateComplete Type

Pascal

```
TWebBrowser_V1NavigateComplete = procedure (ASender: TObject; const URL: WideString) of object;
```

C++

```
(ASender: TObject; const URL: WideString) ( TWebBrowser_V1NavigateComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1NavigateComplete.

8.3.57 SHDocVw.TWebBrowser_V1NewWindow Type

Pascal

```
TWebBrowser_V1NewWindow = procedure (ASender: TObject; const URL: WideString; Flags: Integer;
const TargetFrameName: WideString; var PostData: OleVariant; const Headers: WideString; var
Processed: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Processed: WordBool) (
TWebBrowser_V1NewWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1NewWindow.

8.3.58 SHDocVw.TWebBrowser_V1ProgressChange Type

Pascal

```
TWebBrowser_V1ProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) ( TWebBrowser_V1ProgressChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1ProgressChange.

8.3.59 SHDocVw.TWebBrowser_V1PropertyChange Type

Pascal

```
TWebBrowser_V1PropertyChange = procedure (ASender: TObject; const Property_: WideString) of
object;
```

C++

```
(ASender: TObject; const Property_: WideString) ( TWebBrowser_V1PropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1PropertyChange.

8.3.60 SHDocVw.TWebBrowser_V1Quit Type

Pascal

```
TWebBrowser_V1Quit = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TWebBrowser_V1Quit)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1Quit.

8.3.61 SHDocVw.TWebBrowser_V1StatusTextChange Type

Pascal

```
TWebBrowser_V1StatusTextChange = procedure (ASender: TObject; const Text: WideString) of
object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowser_V1StatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1StatusTextChange.

8.3.62 SHDocVw.TWebBrowser_V1TitleChange Type

Pascal

```
TWebBrowser_V1TitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowser_V1TitleChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1TitleChange.

8.3.63 SHDocVw.TWebBrowserBeforeNavigate2 Type

TWebBrowserBeforeNavigate2 is the type for the BeforeNavigate2 event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserBeforeNavigate2 = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Flags: OleVariant; var TargetFrameName: OleVariant; var PostData: OleVariant;
var Headers: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Flags: OleVariant; var
TargetFrameName: OleVariant; var PostData: OleVariant; var Headers: OleVariant; var Cancel:
WordBool) ( TWebBrowserBeforeNavigate2)();
```

File

SHDocVw

Description

Sender is the Web browser control that is about to look up a new URL.

pDisp is the Automation interface of the Web browser control specified by Sender.

URL is the Uniform Resource Locator of the resource the Web browser is looking up. Change this value to redirect the navigation operation to a different resource.

Flags is not currently used.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame. Change this value to change where the resource is displayed. See the Navigate method for a list of possible values.

PostData contains the data sent to the server when the underlying operation is an HTTP post message. The event handler can change this value before it is sent to the target URL.

Headers contains any headers sent to the servers when the URL represents an HTTP message. HTTP headers specify such things as the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers). The event handler can change this value before it is sent to the target URL.

Cancel determines whether the Web browser looks up the specified resource after the event handler exits. Change Cancel to true to cancel the navigation operation.

8.3.64 SHDocVw.TWebBrowserClientToHostWindow Type

Pascal

```
TWebBrowserClientToHostWindow = procedure (ASender: TObject; var CX: Integer; var CY: Integer)
of object;
```

C++

```
(ASender: TObject; var CX: Integer; var CY: Integer) ( TWebBrowserClientToHostWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserClientToHostWindow.

8.3.65 SHDocVw.TWebBrowserCommandStateChange Type

TWebBrowserCommandStateChange is the type for the OnCommandStateChange event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserCommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) ( TWebBrowserCommandStateChange)();
```

File

SHDocVw

Description

Sender is the Web browser control whose capabilities have changed.

Command indicates what has changed. The following table lists the possible values:

ConstantValueMeaning

Constant	Value	Meaning
CSC_UPDATECOMMANDS (see page 844)	-1	Any change not covered by the other constants. The application must check the properties of the Web browser to update its controls. For example, the event handler might check the Busy property to update a Stop button.
CSC_NAVIGATEFORWARD (see page 844)	1	The history list changed the ability of the GoForward method to navigate to a new URL. The Enable parameter indicates whether GoForward now navigates to a new URL (true), or not (false).
CSC_NAVIGATEBACK (see page 844)	2	The history list changed the ability of the GoBack method to navigate to a new URL. The Enable parameter indicates whether GoBack now navigates to a new URL (true), or not (false).

Enable indicates whether the CSC_NAVIGATEFORWARD (see page 844) or CSC_NAVIGATEBACK (see page 844) commands should now be enabled (true), or not (false).

8.3.66 SHDocVw.TWebBrowserDocumentComplete Type

TWebBrowserDocumentComplete is the type for event handlers that respond when the Service Control manager stops a service.

Pascal

```
TWebBrowserDocumentComplete = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
```

```
OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TWebBrowserDocumentComplete)();
```

File

SHDocVw

Description

Sender is the Web browser that is loading the document.

pDisp is the Automation interface of the top-level frame or browser. When loading a document without frames, pDisp is the interface of the Web browser. When loading a document with multiple frames, this is the interface of the containing frame, except for the very last time the event occurs, when it is the interface of the Web browser.

URL is the URL, UNC file name, or PIDL that to which the Web browser navigated. This URL can be different from the URL to which the browser was told to navigate. For example, the browser may have been redirected by the target resource or by an OnCommandStateChange event handler. In addition, the value of URL is the canonicalized and qualified URL: for example, if an application specified a URL of "www.borland.com" in a call to the Navigate or Navigate2 method, the URL in the OnDocumentComplete event handler is "http://www.borland.com/".

8.3.67 SHDocVw.TWebBrowserFileDownload Type

Pascal

```
TWebBrowserFileDownload = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TWebBrowserFileDownload)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserFileDownload.

8.3.68 SHDocVw.TWebBrowserNavigateComplete2 Type

TWebBrowserNavigateComplete2 is the type for the OnNavigateComplete2 event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserNavigateComplete2 = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TWebBrowserNavigateComplete2)();
```

File

SHDocVw

Description

Sender is the Web browser that navigated to the new resource.

pDisp is the Automation interface of the browser.

URL is the URL, UNC file name, or PIDL that to which the Web browser navigated. This URL can be different from the URL to which the browser was told to navigate. For example, the browser may have been redirected by the target resource or by an OnBeforeNavigate2 event handler. In addition, the value of URL is the canonicalized and qualified URL: for example, if an application specified a URL of "www.borland.com" in a call to the Navigate or Navigate2 method, the URL in the OnDocumentComplete event handler is "http://www.borland.com/".

8.3.69 SHDocVw.TWebBrowserNavigateError Type

Pascal

```
TWebBrowserNavigateError = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Frame: OleVariant; var StatusCode: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant; var
StatusCode: OleVariant; var Cancel: WordBool) ( TWebBrowserNavigateError)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserNavigateError.

8.3.70 SHDocVw.TWebBrowserNewWindow2 Type

TWebBrowserNewWindow2 is the type for the OnNewWindow2 event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserNewWindow2 = procedure (ASender: TObject; var ppDisp: IDispatch; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; var ppDisp: IDispatch; var Cancel: WordBool) ( TWebBrowserNewWindow2)();
```

File

SHDocVw

Description

Sender is the WebBrowser (see page 837) that needs a new window to display its target resource.

ppDisp optionally returns the interface for a newly created, hidden, TWebBrowser (see page 504) component that can act as the new window. The Web browser configures this component and navigates to the target URL, starting with an OnBeforeNavigate2 event. If the event handler does not create a component and return its interface as the ppDisp parameter, the Web browser generates a top-level window as a separate, nonhosted process.

Cancel allows the event handler to block the creation of a new window. When the event handler sets Cancel to true, the Web

browser tries to display the target resource in its current window, starting with an OnBeforeNavigate2 event.

Note: The event handler should not return a value for ppDisp when setting Cancel to true.

8.3.71 SHDocVw.TWebBrowserOnFullScreen Type

Pascal

```
TWebBrowserOnFullScreen = procedure (ASender: TObject; FullScreen: WordBool) of object;
```

C++

```
(ASender: TObject; FullScreen: WordBool) ( TWebBrowserOnFullScreen)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnFullScreen.

8.3.72 SHDocVw.TWebBrowserOnMenuBar Type

Pascal

```
TWebBrowserOnMenuBar = procedure (ASender: TObject; MenuBar: WordBool) of object;
```

C++

```
(ASender: TObject; MenuBar: WordBool) ( TWebBrowserOnMenuBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnMenuBar.

8.3.73 SHDocVw.TWebBrowserOnStatusBar Type

Pascal

```
TWebBrowserOnStatusBar = procedure (ASender: TObject; StatusBar: WordBool) of object;
```

C++

```
(ASender: TObject; StatusBar: WordBool) ( TWebBrowserOnStatusBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnStatusBar.

8.3.74 SHDocVw.TWebBrowserOnTheaterMode Type

Pascal

```
TWebBrowserOnTheaterMode = procedure (ASender: TObject; TheaterMode: WordBool) of object;
```

C++

```
(ASender: TObject; TheaterMode: WordBool) ( TWebBrowserOnTheaterMode)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnTheaterMode.

8.3.75 SHDocVw.TWebBrowserOnToolBar Type

Pascal

```
TWebBrowserOnToolBar = procedure (ASender: TObject; ToolBar: WordBool) of object;
```

C++

```
(ASender: TObject; ToolBar: WordBool) ( TWebBrowserOnToolBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnToolBar.

8.3.76 SHDocVw.TWebBrowserOnVisible Type

TWebBrowserOnVisible is the type for the OnVisible event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserOnVisible = procedure (ASender: TObject; Visible: WordBool) of object;
```

C++

```
(ASender: TObject; Visible: WordBool) ( TWebBrowserOnVisible)();
```

File

SHDocVw

Description

Sender is the Web browser whose Visible property is changing.

Visible is true if the Web browser is about to appear, false if the Web browser is about to be hidden.

8.3.77 SHDocVw.TWebBrowserPrintTemplateInstantiation Type

Pascal

```
TWebBrowserPrintTemplateInstantiation = procedure (ASender: TObject; const pDisp: IDispatch)
of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TWebBrowserPrintTemplateInstantiation)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.

8.3.78 SHDocVw.TWebBrowserPrintTemplateTeardown Type

Pascal

```
TWebBrowserPrintTemplateTeardown = procedure (ASender: TObject; const pDisp: IDispatch) of
object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TWebBrowserPrintTemplateTeardown)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrintTemplateTeardown.

8.3.79 SHDocVw.TWebBrowserPrivacyImpactedStateChange Type

Pascal

```
TWebBrowserPrivacyImpactedStateChange = procedure (ASender: TObject; bImpacted: WordBool) of
object;
```

C++

```
(ASender: TObject; bImpacted: WordBool) ( TWebBrowserPrivacyImpactedStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.

8.3.80 SHDocVw.TWebBrowserProgressChange Type

TWebBrowserProgressChange is the type for the OnProgressChange event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) ( TWebBrowserProgressChange)();
```

File

SHDocVw

Description

Sender is the Web browser control that is in the process of downloading a document.

Progress indicates how much of the document has already been downloaded, on a scale of 0 to ProgressMax. When Progress is –1, the operation is finished.

ProgressMax indicates the total size of the download operation.

Tip: To calculate the percentage of progress to show in a progress indicator (when Progress is not –1), multiply the value of Progress by 100 and divide by the value of ProgressMax.

8.3.81 SHDocVw.TWebBrowserPropertyChange Type

Pascal

```
TWebBrowserPropertyChange = procedure (ASender: TObject; const szProperty: WideString) of
object;
```

C++

```
(ASender: TObject; const szProperty: WideString) ( TWebBrowserPropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPropertyChange.

8.3.82 SHDocVw.TWebBrowserSetSecureLockIcon Type

Pascal

```
TWebBrowserSetSecureLockIcon = procedure (ASender: TObject; SecureLockIcon: Integer) of object;
```

C++

```
(ASender: TObject; SecureLockIcon: Integer) ( TWebBrowserSetSecureLockIcon)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserSetSecureLockIcon.

8.3.83 SHDocVw.TWebBrowserStatusTextChange Type

Pascal

```
TWebBrowserStatusTextChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowserStatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserStatusTextChange.

8.3.84 SHDocVw.TWebBrowserTitleChange Type

TWebBrowserTitleChange is the type for the OnTitleChange event handler on TWebBrowser (see page 504).

Pascal

```
TWebBrowserTitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowserTitleChange)();
```

File

SHDocVw

Description

Sender is the Web browser that is unloading a document.

Text is the newly-available title of the document.

8.3.85 SHDocVw.TWebBrowserUpdatePageStatus Type

Pascal

```
TWebBrowserUpdatePageStatus = procedure (ASender: TObject; const pDisp: IDispatch; var nPage:
OleVariant; var fDone: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var nPage: OleVariant; var fDone: OleVariant) (
TWebBrowserUpdatePageStatus)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserUpdatePageStatus.

8.3.86 SHDocVw.TWebBrowserWindowClosing Type

Pascal

```
TWebBrowserWindowClosing = procedure (ASender: TObject; IsChildWindow: WordBool; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; IsChildWindow: WordBool; var Cancel: WordBool) (
TWebBrowserWindowClosing)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowClosing.

8.3.87 SHDocVw.TWebBrowserWindowSetHeight Type

Pascal

```
TWebBrowserWindowSetHeight = procedure (ASender: TObject; Height: Integer) of object;
```

C++

```
(ASender: TObject; Height: Integer) ( TWebBrowserWindowSetHeight)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetHeight.

8.3.88 SHDocVw.TWebBrowserWindowSetLeft Type

Pascal

```
TWebBrowserWindowSetLeft = procedure (ASender: TObject; Left: Integer) of object;
```

C++

```
(ASender: TObject; Left: Integer) ( TWebBrowserWindowSetLeft)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetLeft.

8.3.89 SHDocVw.TWebBrowserWindowSetResizable Type

Pascal

```
TWebBrowserWindowSetResizable = procedure (ASender: TObject; Resizable: WordBool) of object;
```

C++

```
(ASender: TObject; Resizable: WordBool) ( TWebBrowserWindowSetResizable)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetResizable.

8.3.90 SHDocVw.TWebBrowserWindowSetTop Type

Pascal

```
TWebBrowserWindowSetTop = procedure (ASender: TObject; Top: Integer) of object;
```

C++

```
(ASender: TObject; Top: Integer) ( TWebBrowserWindowSetTop)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetTop.

8.3.91 SHDocVw.TWebBrowserWindowSetWidth Type

Pascal

```
TWebBrowserWindowSetWidth = procedure (ASender: TObject; Width: Integer) of object;
```

C++

```
(ASender: TObject; Width: Integer) ( TWebBrowserWindowSetWidth)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetWidth.

8.3.92 SHDocVw.WebBrowser Type

Pascal

```
WebBrowser = IWebBrowser2;
```

C++

```
IWebBrowser2 WebBrowser;
```

File

SHDocVw

Description

This is type SHDocVw.WebBrowser.

8.3.93 SHDocVw.WebBrowser_V1 Type

Pascal

```
WebBrowser_V1 = IWebBrowser;
```

C++

```
IWebBrowser WebBrowser_V1;
```

File

SHDocVw

Description

This is type SHDocVw.WebBrowser_V1.

8.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CGID_IWebBrowser (see page 840)	This is constant SHDocVw.CGID_IWebBrowser.
CLASS_CScriptErrorList (see page 841)	This is constant SHDocVw.CLASS_CScriptErrorList.
CLASS_InternetExplorer (see page 841)	This is constant SHDocVw.CLASS_InternetExplorer.
CLASS_SearchAssistantOC (see page 841)	This is constant SHDocVw.CLASS_SearchAssistantOC.
CLASS_ShellBrowserWindow (see page 842)	This is constant SHDocVw.CLASS_ShellBrowserWindow.
CLASS_ShellNameSpace (see page 842)	This is constant SHDocVw.CLASS_ShellNameSpace.
CLASS_ShellUIHelper (see page 842)	This is constant SHDocVw.CLASS_ShellUIHelper.
CLASS_ShellWindows (see page 843)	This is constant SHDocVw.CLASS_ShellWindows.
CLASS_WebBrowser (see page 843)	This is constant SHDocVw.CLASS_WebBrowser.
CLASS_WebBrowser_V1 (see page 843)	This is constant SHDocVw.CLASS_WebBrowser_V1.
CSC_NAVIGATEBACK (see page 844)	This is constant SHDocVw.CSC_NAVIGATEBACK.
CSC_NAVIGATEFORWARD (see page 844)	This is constant SHDocVw.CSC_NAVIGATEFORWARD.
CSC_UPDATECOMMANDS (see page 844)	This is constant SHDocVw.CSC_UPDATECOMMANDS.
DIID__SearchAssistantEvents (see page 845)	This is constant SHDocVw.DIID__SearchAssistantEvents.
DIID_DShellNameSpaceEvents (see page 845)	This is constant SHDocVw.DIID_DShellNameSpaceEvents.
DIID_DShellWindowsEvents (see page 845)	This is constant SHDocVw.DIID_DShellWindowsEvents.
DIID_DWebBrowserEvents (see page 846)	This is constant SHDocVw.DIID_DWebBrowserEvents.
DIID_DWebBrowserEvents2 (see page 846)	This is constant SHDocVw.DIID_DWebBrowserEvents2.
dtlOcxPage (see page 846)	This is constant SHDocVw.dtlOcxPage.
dtlServerPage (see page 847)	This is constant SHDocVw.dtlServerPage.
HTMLID_FIND (see page 847)	This is constant SHDocVw.HTMLID_FIND.
HTMLID_OPTIONS (see page 847)	This is constant SHDocVw.HTMLID_OPTIONS.
HTMLID_VIEWSOURCE (see page 848)	This is constant SHDocVw.HTMLID_VIEWSOURCE.
IID_IScriptErrorList (see page 848)	This is constant SHDocVw.IID_IScriptErrorList.
IID_ISearch (see page 848)	This is constant SHDocVw.IID_ISearch.
IID_ISearchAssistantOC (see page 849)	This is constant SHDocVw.IID_ISearchAssistantOC.
IID_ISearchAssistantOC2 (see page 849)	This is constant SHDocVw.IID_ISearchAssistantOC2.
IID_ISearchAssistantOC3 (see page 849)	This is constant SHDocVw.IID_ISearchAssistantOC3.
IID_ISearches (see page 850)	This is constant SHDocVw.IID_ISearches.
IID_IShellFavoritesNameSpace (see page 850)	This is constant SHDocVw.IID_IShellFavoritesNameSpace.
IID_IShellNameSpace (see page 850)	This is constant SHDocVw.IID_IShellNameSpace.
IID_IShellUIHelper (see page 851)	This is constant SHDocVw.IID_IShellUIHelper.
IID_IShellWindows (see page 851)	This is constant SHDocVw.IID_IShellWindows.
IID_IWebBrowser (see page 851)	This is constant SHDocVw.IID_IWebBrowser.
IID_IWebBrowser2 (see page 852)	This is constant SHDocVw.IID_IWebBrowser2.
IID_IWebBrowserApp (see page 852)	This is constant SHDocVw.IID_IWebBrowserApp.
LIBID_SHDocVw (see page 852)	This is constant SHDocVw.LIBID_SHDocVw.
navAllowAutosearch (see page 853)	This is constant SHDocVw.navAllowAutosearch.
navBrowserBar (see page 853)	This is constant SHDocVw.navBrowserBar.
navNoHistory (see page 853)	This is constant SHDocVw.navNoHistory.
navNoReadFromCache (see page 854)	This is constant SHDocVw.navNoReadFromCache.
navNoWriteToCache (see page 854)	This is constant SHDocVw.navNoWriteToCache.
navOpenInNewWindow (see page 854)	This is constant SHDocVw.navOpenInNewWindow.
OLECMDEXECOPT_DODEFAULT (see page 855)	This is constant SHDocVw.OLECMDEXECOPT_DODEFAULT.

OLECMDEXECOPT_DONTPROMPTUSER (see page 855)	This is constant SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER.
OLECMDEXECOPT_PROMPTUSER (see page 855)	This is constant SHDocVw.OLECMDEXECOPT_PROMPTUSER.
OLECMDEXECOPT_SHOWHELP (see page 856)	This is constant SHDocVw.OLECMDEXECOPT_SHOWHELP.
OLECMDF_DEFHIDEONCTXTMENU (see page 856)	This is constant SHDocVw.OLECMDF_DEFHIDEONCTXTMENU.
OLECMDF_ENABLED (see page 856)	This is constant SHDocVw.OLECMDF_ENABLED.
OLECMDF_INVISIBLE (see page 857)	This is constant SHDocVw.OLECMDF_INVISIBLE.
OLECMDF_LATCHED (see page 857)	This is constant SHDocVw.OLECMDF_LATCHED.
OLECMDF_NINCHED (see page 857)	This is constant SHDocVw.OLECMDF_NINCHED.
OLECMDF_SUPPORTED (see page 858)	This is constant SHDocVw.OLECMDF_SUPPORTED.
OLECMDID_ALLOWUILESSSAVEAS (see page 858)	This is constant SHDocVw.OLECMDID_ALLOWUILESSSAVEAS.
OLECMDID_CLEARSELECTION (see page 858)	This is constant SHDocVw.OLECMDID_CLEARSELECTION.
OLECMDID_CLOSE (see page 859)	This is constant SHDocVw.OLECMDID_CLOSE.
OLECMDID_COPY (see page 859)	This is constant SHDocVw.OLECMDID_COPY.
OLECMDID_CUT (see page 859)	This is constant SHDocVw.OLECMDID_CUT.
OLECMDID_DELETE (see page 860)	This is constant SHDocVw.OLECMDID_DELETE.
OLECMDID_DONTDOWNLOADCSS (see page 860)	This is constant SHDocVw.OLECMDID_DONTDOWNLOADCSS.
OLECMDID_ENABLE_INTERACTION (see page 860)	This is constant SHDocVw.OLECMDID_ENABLE_INTERACTION.
OLECMDID_FIND (see page 861)	This is constant SHDocVw.OLECMDID_FIND.
OLECMDID_GETPRINTTEMPLATE (see page 861)	This is constant SHDocVw.OLECMDID_GETPRINTTEMPLATE.
OLECMDID_GETZOOMRANGE (see page 861)	This is constant SHDocVw.OLECMDID_GETZOOMRANGE.
OLECMDID_HIDETOOLBARS (see page 862)	This is constant SHDocVw.OLECMDID_HIDETOOLBARS.
OLECMDID_HTTPEQUIV (see page 862)	This is constant SHDocVw.OLECMDID_HTTPEQUIV.
OLECMDID_HTTPEQUIV_DONE (see page 862)	This is constant SHDocVw.OLECMDID_HTTPEQUIV_DONE.
OLECMDID_NEW (see page 863)	This is constant SHDocVw.OLECMDID_NEW.
OLECMDID_ONTOOLBARACTIVATED (see page 863)	This is constant SHDocVw.OLECMDID_ONTOOLBARACTIVATED.
OLECMDID_ONUNLOAD (see page 863)	This is constant SHDocVw.OLECMDID_ONUNLOAD.
OLECMDID_OPEN (see page 864)	This is constant SHDocVw.OLECMDID_OPEN.
OLECMDID_PAGESETUP (see page 864)	This is constant SHDocVw.OLECMDID_PAGESETUP.
OLECMDID_PASTE (see page 864)	This is constant SHDocVw.OLECMDID_PASTE.
OLECMDID_PASTESPECIAL (see page 865)	This is constant SHDocVw.OLECMDID_PASTESPECIAL.
OLECMDID_PREREFRESH (see page 865)	This is constant SHDocVw.OLECMDID_PREREFRESH.
OLECMDID_PRINT (see page 865)	This is constant SHDocVw.OLECMDID_PRINT.
OLECMDID_PRINT2 (see page 866)	This is constant SHDocVw.OLECMDID_PRINT2.
OLECMDID_PRINTPREVIEW (see page 866)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW.
OLECMDID_PRINTPREVIEW2 (see page 866)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW2.
OLECMDID_PROPERTIES (see page 867)	This is constant SHDocVw.OLECMDID_PROPERTIES.
OLECMDID_PROPERTYBAG2 (see page 867)	This is constant SHDocVw.OLECMDID_PROPERTYBAG2.
OLECMDID_REDO (see page 867)	This is constant SHDocVw.OLECMDID_REDO.
OLECMDID_REFRESH (see page 868)	This is constant SHDocVw.OLECMDID_REFRESH.
OLECMDID_SAVE (see page 868)	This is constant SHDocVw.OLECMDID_SAVE.
OLECMDID_SAVEAS (see page 868)	This is constant SHDocVw.OLECMDID_SAVEAS.
OLECMDID_SAVECOPYAS (see page 869)	This is constant SHDocVw.OLECMDID_SAVECOPYAS.
OLECMDID_SELECTALL (see page 869)	This is constant SHDocVw.OLECMDID_SELECTALL.
OLECMDID_SETDOWNLOADSTATE (see page 869)	This is constant SHDocVw.OLECMDID_SETDOWNLOADSTATE.
OLECMDID_SETPRINTTEMPLATE (see page 870)	This is constant SHDocVw.OLECMDID_SETPRINTTEMPLATE.
OLECMDID_SETPROGRESSMAX (see page 870)	This is constant SHDocVw.OLECMDID_SETPROGRESSMAX.
OLECMDID_SETPROGRESSPOS (see page 870)	This is constant SHDocVw.OLECMDID_SETPROGRESSPOS.
OLECMDID_SETPROGRESSTEXT (see page 871)	This is constant SHDocVw.OLECMDID_SETPROGRESSTEXT.
OLECMDID_SETTITLE (see page 871)	This is constant SHDocVw.OLECMDID_SETTITLE.
OLECMDID_SHOWFIND (see page 871)	This is constant SHDocVw.OLECMDID_SHOWFIND.
OLECMDID_SHOWMESSAGE (see page 872)	This is constant SHDocVw.OLECMDID_SHOWMESSAGE.
OLECMDID_SHOWPAGESETUP (see page 872)	This is constant SHDocVw.OLECMDID_SHOWPAGESETUP.
OLECMDID_SHOWPRINT (see page 872)	This is constant SHDocVw.OLECMDID_SHOWPRINT.
OLECMDID_SHOWSCRIPTERROR (see page 873)	This is constant SHDocVw.OLECMDID_SHOWSCRIPTERROR.

OLECMDID_SPELL (see page 873)	This is constant SHDocVw.OLECMDID_SPELL.
OLECMDID_STOP (see page 873)	This is constant SHDocVw.OLECMDID_STOP.
OLECMDID_STOPDOWNLOAD (see page 874)	This is constant SHDocVw.OLECMDID_STOPDOWNLOAD.
OLECMDID_UNDO (see page 874)	This is constant SHDocVw.OLECMDID_UNDO.
OLECMDID_UPDATECOMMANDS (see page 874)	This is constant SHDocVw.OLECMDID_UPDATECOMMANDS.
OLECMDID_UPDATEPAGESTATUS (see page 875)	This is constant SHDocVw.OLECMDID_UPDATEPAGESTATUS.
OLECMDID_ZOOM (see page 875)	This is constant SHDocVw.OLECMDID_ZOOM.
READYSTATE_COMPLETE (see page 875)	This is constant SHDocVw.READYSTATE_COMPLETE.
READYSTATE_INTERACTIVE (see page 876)	This is constant SHDocVw.READYSTATE_INTERACTIVE.
READYSTATE_LOADED (see page 876)	This is constant SHDocVw.READYSTATE_LOADED.
READYSTATE_LOADING (see page 876)	This is constant SHDocVw.READYSTATE_LOADING.
READYSTATE_UNINITIALIZED (see page 877)	This is constant SHDocVw.READYSTATE_UNINITIALIZED.
REFRESH_COMPLETELY (see page 877)	This is constant SHDocVw.REFRESH_COMPLETELY.
REFRESH_CONTINUE (see page 877)	This is constant SHDocVw.REFRESH_CONTINUE.
REFRESH_IFEXPIRED (see page 878)	This is constant SHDocVw.REFRESH_IFEXPIRED.
REFRESH_NORMAL (see page 878)	This is constant SHDocVw.REFRESH_NORMAL.
secureLockIconMixed (see page 878)	This is constant SHDocVw.secureLockIconMixed.
secureLockIconSecure128Bit (see page 879)	This is constant SHDocVw.secureLockIconSecure128Bit.
secureLockIconSecure40Bit (see page 879)	This is constant SHDocVw.secureLockIconSecure40Bit.
secureLockIconSecure56Bit (see page 879)	This is constant SHDocVw.secureLockIconSecure56Bit.
secureLockIconSecureFortezza (see page 880)	This is constant SHDocVw.secureLockIconSecureFortezza.
secureLockIconSecureUnknownBits (see page 880)	This is constant SHDocVw.secureLockIconSecureUnknownBits.
secureLockIconUnsecure (see page 880)	This is constant SHDocVw.secureLockIconUnsecure.
SHDocVwMajorVersion (see page 881)	This is constant SHDocVw.SHDocVwMajorVersion.
SHDocVwMinorVersion (see page 881)	This is constant SHDocVw.SHDocVwMinorVersion.
SWC_3RDPARTY (see page 881)	This is constant SHDocVw.SWC_3RDPARTY.
SWC_BROWSER (see page 882)	This is constant SHDocVw.SWC_BROWSER.
SWC_CALLBACK (see page 882)	This is constant SHDocVw.SWC_CALLBACK.
SWC_EXPLORER (see page 882)	This is constant SHDocVw.SWC_EXPLORER.
SWFO_COOKIEPASSED (see page 883)	This is constant SHDocVw.SWFO_COOKIEPASSED.
SWFO_INCLUDEPENDING (see page 883)	This is constant SHDocVw.SWFO_INCLUDEPENDING.
SWFO_NEEDDISPATCH (see page 883)	This is constant SHDocVw.SWFO_NEEDDISPATCH.

8.4.1 SHDocVw.CGID_IWebBrowser Constant

Pascal

```
CGID_IWebBrowser: TGUID = '{ED016940-BD5B-11CF-BA4E-00C04FD70816}';
```

C++

```
TGUID CGID_IWebBrowser = '{ED016940-BD5B-11CF-BA4E-00C04FD70816}';
```

File

SHDocVw

Description

This is constant SHDocVw.CGID_IWebBrowser.

8.4.2 SHDocVw.CLASS_CScriptErrorList Constant

Pascal

```
CLASS_CScriptErrorList: TGUID = '{EFD01300-160F-11D2-BB2E-00805FF7EFCA}';
```

C++

```
TGUID CLASS_CScriptErrorList = '{EFD01300-160F-11D2-BB2E-00805FF7EFCA}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_CScriptErrorList.

8.4.3 SHDocVw.CLASS_InternetExplorer Constant

Pascal

```
CLASS_InternetExplorer: TGUID = '{0002DF01-0000-0000-C000-000000000046}';
```

C++

```
TGUID CLASS_InternetExplorer = '{0002DF01-0000-0000-C000-000000000046}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_InternetExplorer.

8.4.4 SHDocVw.CLASS_SearchAssistantOC Constant

Pascal

```
CLASS_SearchAssistantOC: TGUID = '{B45FF030-4447-11D2-85DE-00C04FA35C89}';
```

C++

```
TGUID CLASS_SearchAssistantOC = '{B45FF030-4447-11D2-85DE-00C04FA35C89}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_SearchAssistantOC.

8.4.5 SHDocVw.CLASS_ShellBrowserWindow Constant

Pascal

```
CLASS_ShellBrowserWindow: TGUID = '{C08AFD90-F2A1-11D1-8455-00A0C91F3880}';
```

C++

```
TGUID CLASS_ShellBrowserWindow = '{C08AFD90-F2A1-11D1-8455-00A0C91F3880}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellBrowserWindow.

8.4.6 SHDocVw.CLASS_ShellNameSpace Constant

Pascal

```
CLASS_ShellNameSpace: TGUID = '{55136805-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID CLASS_ShellNameSpace = '{55136805-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellNameSpace.

8.4.7 SHDocVw.CLASS_ShellUIHelper Constant

Pascal

```
CLASS_ShellUIHelper: TGUID = '{64AB4BB7-111E-11D1-8F79-00C04FC2FBE1}';
```

C++

```
TGUID CLASS_ShellUIHelper = '{64AB4BB7-111E-11D1-8F79-00C04FC2FBE1}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellUIHelper.

8.4.8 SHDocVw.CLASS_ShellWindows Constant

Pascal

```
CLASS_ShellWindows: TGUID = '{9BA05972-F6A8-11CF-A442-00A0C90A8F39}';
```

C++

```
TGUID CLASS_ShellWindows = '{9BA05972-F6A8-11CF-A442-00A0C90A8F39}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellWindows.

8.4.9 SHDocVw.CLASS_WebBrowser Constant

Pascal

```
CLASS_WebBrowser: TGUID = '{8856F961-340A-11D0-A96B-00C04FD705A2}';
```

C++

```
TGUID CLASS_WebBrowser = '{8856F961-340A-11D0-A96B-00C04FD705A2}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_WebBrowser.

8.4.10 SHDocVw.CLASS_WebBrowser_V1 Constant

Pascal

```
CLASS_WebBrowser_V1: TGUID = '{EAB22AC3-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID CLASS_WebBrowser_V1 = '{EAB22AC3-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_WebBrowser_V1.

8.4.11 SHDocVw.CSC_NAVIGATEBACK Constant

Pascal

```
CSC_NAVIGATEBACK = $00000002;
```

C++

```
CSC_NAVIGATEBACK = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_NAVIGATEBACK.

8.4.12 SHDocVw.CSC_NAVIGATEFORWARD Constant

Pascal

```
CSC_NAVIGATEFORWARD = $00000001;
```

C++

```
CSC_NAVIGATEFORWARD = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_NAVIGATEFORWARD.

8.4.13 SHDocVw.CSC_UPDATECOMMANDS Constant

Pascal

```
CSC_UPDATECOMMANDS = $FFFFFFFF;
```

C++

```
CSC_UPDATECOMMANDS = 0xFFFFFFFF;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_UPDATECOMMANDS.

8.4.14 SHDocVw.DIID__SearchAssistantEvents Constant

Pascal

```
DIID__SearchAssistantEvents: TGUID = '{1611FDDA-445B-11D2-85DE-00C04FA35C89}';
```

C++

```
TGUID DIID__SearchAssistantEvents = '{1611FDDA-445B-11D2-85DE-00C04FA35C89}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID__SearchAssistantEvents.

8.4.15 SHDocVw.DIID_DShellNameSpaceEvents Constant

Pascal

```
DIID_DShellNameSpaceEvents: TGUID = '{55136806-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID DIID_DShellNameSpaceEvents = '{55136806-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DShellNameSpaceEvents.

8.4.16 SHDocVw.DIID_DShellWindowsEvents Constant

Pascal

```
DIID_DShellWindowsEvents: TGUID = '{FE4106E0-399A-11D0-A48C-00A0C90A8F39}';
```

C++

```
TGUID DIID_DShellWindowsEvents = '{FE4106E0-399A-11D0-A48C-00A0C90A8F39}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DShellWindowsEvents.

8.4.17 SHDocVw.DIID_DWebBrowserEvents Constant

Pascal

```
DIID_DWebBrowserEvents: TGUID = '{EAB22AC2-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID DIID_DWebBrowserEvents = '{EAB22AC2-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DWebBrowserEvents.

8.4.18 SHDocVw.DIID_DWebBrowserEvents2 Constant

Pascal

```
DIID_DWebBrowserEvents2: TGUID = '{34A715A0-6587-11D0-924A-0020AFC7AC4D}';
```

C++

```
TGUID DIID_DWebBrowserEvents2 = '{34A715A0-6587-11D0-924A-0020AFC7AC4D}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DWebBrowserEvents2.

8.4.19 SHDocVw.dtlOcxPage Constant

Pascal

```
dtlOcxPage = 'ActiveX';
```

C++

```
dtlOcxPage = 'ActiveX';
```

File

SHDocVw

Description

This is constant SHDocVw.dtlOcxPage.

8.4.20 SHDocVw.dtlServerPage Constant

Pascal

```
dtlServerPage = 'Servers';
```

C++

```
dtlServerPage = 'Servers';
```

File

SHDocVw

Description

This is constant SHDocVw.dtlServerPage.

8.4.21 SHDocVw.HTMLID_FIND Constant

Pascal

```
HTMLID_FIND = 1;
```

C++

```
HTMLID_FIND = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_FIND.

8.4.22 SHDocVw.HTMLID_OPTIONS Constant

Pascal

```
HTMLID_OPTIONS = 3;
```

C++

```
HTMLID_OPTIONS = 3;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_OPTIONS.

8.4.23 SHDocVw.HTMLID_VIEWSOURCE Constant

Pascal

```
HTMLID_VIEWSOURCE = 2;
```

C++

```
HTMLID_VIEWSOURCE = 2;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_VIEWSOURCE.

8.4.24 SHDocVw.IID_IScriptErrorList Constant

Pascal

```
IID_IScriptErrorList: TGUID = '{F3470F24-15FD-11D2-BB2E-00805FF7EFCA}';
```

C++

```
TGUID IID_IScriptErrorList = '{F3470F24-15FD-11D2-BB2E-00805FF7EFCA}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IScriptErrorList.

8.4.25 SHDocVw.IID_ISearch Constant

Pascal

```
IID_ISearch: TGUID = '{BA9239A4-3DD5-11D2-BF8B-00C04FB93661}';
```

C++

```
TGUID IID_ISearch = '{BA9239A4-3DD5-11D2-BF8B-00C04FB93661}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearch.

8.4.26 SHDocVw.IID_ISearchAssistantOC Constant

Pascal

```
IID_ISearchAssistantOC: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA1}';
```

C++

```
TGUID IID_ISearchAssistantOC = '{72423E8F-8011-11D2-BE79-00A0C9A83DA1}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC.

8.4.27 SHDocVw.IID_ISearchAssistantOC2 Constant

Pascal

```
IID_ISearchAssistantOC2: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA2}';
```

C++

```
TGUID IID_ISearchAssistantOC2 = '{72423E8F-8011-11D2-BE79-00A0C9A83DA2}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC2.

8.4.28 SHDocVw.IID_ISearchAssistantOC3 Constant

Pascal

```
IID_ISearchAssistantOC3: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA3}';
```

C++

```
TGUID IID_ISearchAssistantOC3 = '{72423E8F-8011-11D2-BE79-00A0C9A83DA3}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC3.

8.4.29 SHDocVw.IID_ISearches Constant

Pascal

```
IID_ISearches: TGUID = '{47C922A2-3DD5-11D2-BF8B-00C04FB93661}';
```

C++

```
TGUID IID_ISearches = '{47C922A2-3DD5-11D2-BF8B-00C04FB93661}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearches.

8.4.30 SHDocVw.IID_IShellFavoritesNameSpace Constant

Pascal

```
IID_IShellFavoritesNameSpace: TGUID = '{55136804-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID IID_IShellFavoritesNameSpace = '{55136804-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellFavoritesNameSpace.

8.4.31 SHDocVw.IID_IShellNameSpace Constant

Pascal

```
IID_IShellNameSpace: TGUID = '{E572D3C9-37BE-4AE2-825D-D521763E3108}';
```

C++

```
TGUID IID_IShellNameSpace = '{E572D3C9-37BE-4AE2-825D-D521763E3108}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellNameSpace.

8.4.32 SHDocVw.IID_IShellUIHelper Constant

Pascal

```
IID_IShellUIHelper: TGUID = '{729FE2F8-1EA8-11D1-8F85-00C04FC2FBE1}';
```

C++

```
TGUID IID_IShellUIHelper = '{729FE2F8-1EA8-11D1-8F85-00C04FC2FBE1}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellUIHelper.

8.4.33 SHDocVw.IID_IShellWindows Constant

Pascal

```
IID_IShellWindows: TGUID = '{85CB6900-4D95-11CF-960C-0080C7F4EE85}';
```

C++

```
TGUID IID_IShellWindows = '{85CB6900-4D95-11CF-960C-0080C7F4EE85}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellWindows.

8.4.34 SHDocVw.IID_IWebBrowser Constant

Pascal

```
IID_IWebBrowser: TGUID = '{EAB22AC1-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID IID_IWebBrowser = '{EAB22AC1-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowser.

8.4.35 SHDocVw.IID_IWebBrowser2 Constant

Pascal

```
IID_IWebBrowser2: TGUID = '{D30C1661-CDAF-11D0-8A3E-00C04FC9E26E}';
```

C++

```
TGUID IID_IWebBrowser2 = '{D30C1661-CDAF-11D0-8A3E-00C04FC9E26E}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowser2.

8.4.36 SHDocVw.IID_IWebBrowserApp Constant

Pascal

```
IID_IWebBrowserApp: TGUID = '{0002DF05-0000-0000-C000-000000000046}';
```

C++

```
TGUID IID_IWebBrowserApp = '{0002DF05-0000-0000-C000-000000000046}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowserApp.

8.4.37 SHDocVw.LIBID_SHDocVw Constant

Pascal

```
LIBID_SHDocVw: TGUID = '{EAB22AC0-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID LIBID_SHDocVw = '{EAB22AC0-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.LIBID_SHDocVw.

8.4.38 SHDocVw.navAllowAutosearch Constant

Pascal

```
navAllowAutosearch = $00000010;
```

C++

```
navAllowAutosearch = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.navAllowAutosearch.

8.4.39 SHDocVw.navBrowserBar Constant

Pascal

```
navBrowserBar = $00000020;
```

C++

```
navBrowserBar = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.navBrowserBar.

8.4.40 SHDocVw.navNoHistory Constant

Pascal

```
navNoHistory = $00000002;
```

C++

```
navNoHistory = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoHistory.

8.4.41 SHDocVw.navNoReadFromCache Constant

Pascal

```
navNoReadFromCache = $00000004;
```

C++

```
navNoReadFromCache = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoReadFromCache.

8.4.42 SHDocVw.navNoWriteToCache Constant

Pascal

```
navNoWriteToCache = $00000008;
```

C++

```
navNoWriteToCache = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoWriteToCache.

8.4.43 SHDocVw.navOpenInNewWindow Constant

Pascal

```
navOpenInNewWindow = $00000001;
```

C++

```
navOpenInNewWindow = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.navOpenInNewWindow.

8.4.44 SHDocVw.OLECMDEXECOPT_DODEFAULT Constant

Pascal

```
OLECMDEXECOPT_DODEFAULT = $00000000;
```

C++

```
OLECMDEXECOPT_DODEFAULT = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_DODEFAULT.

8.4.45 SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER Constant

Pascal

```
OLECMDEXECOPT_DONTPROMPTUSER = $00000002;
```

C++

```
OLECMDEXECOPT_DONTPROMPTUSER = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER.

8.4.46 SHDocVw.OLECMDEXECOPT_PROMPTUSER Constant

Pascal

```
OLECMDEXECOPT_PROMPTUSER = $00000001;
```

C++

```
OLECMDEXECOPT_PROMPTUSER = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_PROMPTUSER.

8.4.47 SHDocVw.OLECMDEXECOPT_SHOWHELP Constant

Pascal

```
OLECMDEXECOPT_SHOWHELP = $00000003;
```

C++

```
OLECMDEXECOPT_SHOWHELP = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_SHOWHELP.

8.4.48 SHDocVw.OLECMDF_DEFHIDEONCTXTMENU Constant

Pascal

```
OLECMDF_DEFHIDEONCTXTMENU = $00000020;
```

C++

```
OLECMDF_DEFHIDEONCTXTMENU = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_DEFHIDEONCTXTMENU.

8.4.49 SHDocVw.OLECMDF_ENABLED Constant

Pascal

```
OLECMDF_ENABLED = $00000002;
```

C++

```
OLECMDF_ENABLED = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_ENABLED.

8.4.50 SHDocVw.OLECMDF_INVISIBLE Constant

Pascal

```
OLECMDF_INVISIBLE = $00000010;
```

C++

```
OLECMDF_INVISIBLE = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_INVISIBLE.

8.4.51 SHDocVw.OLECMDF_LATCHED Constant

Pascal

```
OLECMDF_LATCHED = $00000004;
```

C++

```
OLECMDF_LATCHED = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_LATCHED.

8.4.52 SHDocVw.OLECMDF_NINCHED Constant

Pascal

```
OLECMDF_NINCHED = $00000008;
```

C++

```
OLECMDF_NINCHED = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_NINCHED.

8.4.53 SHDocVw.OLECMDF_SUPPORTED Constant

Pascal

```
OLECMDF_SUPPORTED = $00000001;
```

C++

```
OLECMDF_SUPPORTED = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_SUPPORTED.

8.4.54 SHDocVw.OLECMDID_ALLOWUILESSSAVEAS Constant

Pascal

```
OLECMDID_ALLOWUILESSSAVEAS = $0000002E;
```

C++

```
OLECMDID_ALLOWUILESSSAVEAS = 0x0000002E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ALLOWUILESSSAVEAS.

8.4.55 SHDocVw.OLECMDID_CLEARSELECTION Constant

Pascal

```
OLECMDID_CLEARSELECTION = $00000012;
```

C++

```
OLECMDID_CLEARSELECTION = 0x00000012;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CLEARSELECTION.

8.4.56 SHDocVw.OLECMDID_CLOSE Constant

Pascal

```
OLECMDID_CLOSE = $0000002D;
```

C++

```
OLECMDID_CLOSE = 0x0000002D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CLOSE.

8.4.57 SHDocVw.OLECMDID_COPY Constant

Pascal

```
OLECMDID_COPY = $0000000C;
```

C++

```
OLECMDID_COPY = 0x0000000C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_COPY.

8.4.58 SHDocVw.OLECMDID_CUT Constant

Pascal

```
OLECMDID_CUT = $0000000B;
```

C++

```
OLECMDID_CUT = 0x0000000B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CUT.

8.4.59 SHDocVw.OLECMDID_DELETE Constant

Pascal

```
OLECMDID_DELETE = $00000021;
```

C++

```
OLECMDID_DELETE = 0x00000021;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_DELETE.

8.4.60 SHDocVw.OLECMDID_DONTDOWNLOADCSS Constant

Pascal

```
OLECMDID_DONTDOWNLOADCSS = $0000002F;
```

C++

```
OLECMDID_DONTDOWNLOADCSS = 0x0000002F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_DONTDOWNLOADCSS.

8.4.61 SHDocVw.OLECMDID_ENABLE_INTERACTION Constant

Pascal

```
OLECMDID_ENABLE_INTERACTION = $00000024;
```

C++

```
OLECMDID_ENABLE_INTERACTION = 0x00000024;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ENABLE_INTERACTION.

8.4.62 SHDocVw.OLECMDID_FIND Constant

Pascal

```
OLECMDID_FIND = $00000020;
```

C++

```
OLECMDID_FIND = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_FIND.

8.4.63 SHDocVw.OLECMDID_GETPRINTTEMPLATE Constant

Pascal

```
OLECMDID_GETPRINTTEMPLATE = $00000034;
```

C++

```
OLECMDID_GETPRINTTEMPLATE = 0x00000034;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_GETPRINTTEMPLATE.

8.4.64 SHDocVw.OLECMDID_GETZOOMRANGE Constant

Pascal

```
OLECMDID_GETZOOMRANGE = $00000014;
```

C++

```
OLECMDID_GETZOOMRANGE = 0x00000014;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_GETZOOMRANGE.

8.4.65 SHDocVw.OLECMDID_HIDETOOLBARS Constant

Pascal

```
OLECMDID_HIDETOOLBARS = $00000018;
```

C++

```
OLECMDID_HIDETOOLBARS = 0x00000018;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HIDETOOLBARS.

8.4.66 SHDocVw.OLECMDID_HTTPEQUIV Constant

Pascal

```
OLECMDID_HTTPEQUIV = $00000022;
```

C++

```
OLECMDID_HTTPEQUIV = 0x00000022;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HTTPEQUIV.

8.4.67 SHDocVw.OLECMDID_HTTPEQUIV_DONE Constant

Pascal

```
OLECMDID_HTTPEQUIV_DONE = $00000023;
```

C++

```
OLECMDID_HTTPEQUIV_DONE = 0x00000023;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HTTPEQUIV_DONE.

8.4.68 SHDocVw.OLECMDID_NEW Constant

Pascal

```
OLECMDID_NEW = $00000002;
```

C++

```
OLECMDID_NEW = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_NEW.

8.4.69 SHDocVw.OLECMDID_ONTOOLBARACTIVATED Constant

Pascal

```
OLECMDID_ONTOOLBARACTIVATED = $0000001F;
```

C++

```
OLECMDID_ONTOOLBARACTIVATED = 0x0000001F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ONTOOLBARACTIVATED.

8.4.70 SHDocVw.OLECMDID_ONUNLOAD Constant

Pascal

```
OLECMDID_ONUNLOAD = $00000025;
```

C++

```
OLECMDID_ONUNLOAD = 0x00000025;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ONUNLOAD.

8.4.71 SHDocVw.OLECMDID_OPEN Constant

Pascal

```
OLECMDID_OPEN = $00000001;
```

C++

```
OLECMDID_OPEN = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_OPEN.

8.4.72 SHDocVw.OLECMDID_PAGESETUP Constant

Pascal

```
OLECMDID_PAGESETUP = $00000008;
```

C++

```
OLECMDID_PAGESETUP = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PAGESETUP.

8.4.73 SHDocVw.OLECMDID_PASTE Constant

Pascal

```
OLECMDID_PASTE = $0000000D;
```

C++

```
OLECMDID_PASTE = 0x0000000D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PASTE.

8.4.74 SHDocVw.OLECMDID_PASTESPECIAL Constant

Pascal

```
OLECMDID_PASTESPECIAL = $0000000E;
```

C++

```
OLECMDID_PASTESPECIAL = 0x0000000E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PASTESPECIAL.

8.4.75 SHDocVw.OLECMDID_PREREFRESH Constant

Pascal

```
OLECMDID_PREREFRESH = $00000027;
```

C++

```
OLECMDID_PREREFRESH = 0x00000027;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PREREFRESH.

8.4.76 SHDocVw.OLECMDID_PRINT Constant

Pascal

```
OLECMDID_PRINT = $00000006;
```

C++

```
OLECMDID_PRINT = 0x00000006;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINT.

8.4.77 SHDocVw.OLECMDID_PRINT2 Constant

Pascal

```
OLECMDID_PRINT2 = $00000031;
```

C++

```
OLECMDID_PRINT2 = 0x00000031;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINT2.

8.4.78 SHDocVw.OLECMDID_PRINTPREVIEW Constant

Pascal

```
OLECMDID_PRINTPREVIEW = $00000007;
```

C++

```
OLECMDID_PRINTPREVIEW = 0x00000007;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINTPREVIEW.

8.4.79 SHDocVw.OLECMDID_PRINTPREVIEW2 Constant

Pascal

```
OLECMDID_PRINTPREVIEW2 = $00000032;
```

C++

```
OLECMDID_PRINTPREVIEW2 = 0x00000032;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINTPREVIEW2.

8.4.80 SHDocVw.OLECMDID_PROPERTIES Constant

Pascal

```
OLECMDID_PROPERTIES = $0000000A;
```

C++

```
OLECMDID_PROPERTIES = 0x0000000A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PROPERTIES.

8.4.81 SHDocVw.OLECMDID_PROPERTYBAG2 Constant

Pascal

```
OLECMDID_PROPERTYBAG2 = $00000026;
```

C++

```
OLECMDID_PROPERTYBAG2 = 0x00000026;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PROPERTYBAG2.

8.4.82 SHDocVw.OLECMDID_REDO Constant

Pascal

```
OLECMDID_REDO = $00000010;
```

C++

```
OLECMDID_REDO = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_REDO.

8.4.83 SHDocVw.OLECMDID_REFRESH Constant

Pascal

```
OLECMDID_REFRESH = $00000016;
```

C++

```
OLECMDID_REFRESH = 0x00000016;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_REFRESH.

8.4.84 SHDocVw.OLECMDID_SAVE Constant

Pascal

```
OLECMDID_SAVE = $00000003;
```

C++

```
OLECMDID_SAVE = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVE.

8.4.85 SHDocVw.OLECMDID_SAVEAS Constant

Pascal

```
OLECMDID_SAVEAS = $00000004;
```

C++

```
OLECMDID_SAVEAS = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVEAS.

8.4.86 SHDocVw.OLECMDID_SAVECOPYAS Constant

Pascal

```
OLECMDID_SAVECOPYAS = $00000005;
```

C++

```
OLECMDID_SAVECOPYAS = 0x00000005;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVECOPYAS.

8.4.87 SHDocVw.OLECMDID_SELECTALL Constant

Pascal

```
OLECMDID_SELECTALL = $00000011;
```

C++

```
OLECMDID_SELECTALL = 0x00000011;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SELECTALL.

8.4.88 SHDocVw.OLECMDID_SETDOWNLOADSTATE Constant

Pascal

```
OLECMDID_SETDOWNLOADSTATE = $0000001D;
```

C++

```
OLECMDID_SETDOWNLOADSTATE = 0x0000001D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETDOWNLOADSTATE.

8.4.89 SHDocVw.OLECMDID_SETPRINTTEMPLATE Constant

Pascal

```
OLECMDID_SETPRINTTEMPLATE = $00000033;
```

C++

```
OLECMDID_SETPRINTTEMPLATE = 0x00000033;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPRINTTEMPLATE.

8.4.90 SHDocVw.OLECMDID_SETPROGRESSMAX Constant

Pascal

```
OLECMDID_SETPROGRESSMAX = $00000019;
```

C++

```
OLECMDID_SETPROGRESSMAX = 0x00000019;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSMAX.

8.4.91 SHDocVw.OLECMDID_SETPROGRESSPOS Constant

Pascal

```
OLECMDID_SETPROGRESSPOS = $0000001A;
```

C++

```
OLECMDID_SETPROGRESSPOS = 0x0000001A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSPOS.

8.4.92 SHDocVw.OLECMDID_SETPROGRESSTEXT Constant

Pascal

```
OLECMDID_SETPROGRESSTEXT = $0000001B;
```

C++

```
OLECMDID_SETPROGRESSTEXT = 0x0000001B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSTEXT.

8.4.93 SHDocVw.OLECMDID_SETTITLE Constant

Pascal

```
OLECMDID_SETTITLE = $0000001C;
```

C++

```
OLECMDID_SETTITLE = 0x0000001C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETTITLE.

8.4.94 SHDocVw.OLECMDID_SHOWFIND Constant

Pascal

```
OLECMDID_SHOWFIND = $0000002A;
```

C++

```
OLECMDID_SHOWFIND = 0x0000002A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWFIND.

8.4.95 SHDocVw.OLECMDID_SHOWMESSAGE Constant

Pascal

```
OLECMDID_SHOWMESSAGE = $00000029;
```

C++

```
OLECMDID_SHOWMESSAGE = 0x00000029;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWMESSAGE.

8.4.96 SHDocVw.OLECMDID_SHOWPAGESETUP Constant

Pascal

```
OLECMDID_SHOWPAGESETUP = $0000002B;
```

C++

```
OLECMDID_SHOWPAGESETUP = 0x0000002B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWPAGESETUP.

8.4.97 SHDocVw.OLECMDID_SHOWPRINT Constant

Pascal

```
OLECMDID_SHOWPRINT = $0000002C;
```

C++

```
OLECMDID_SHOWPRINT = 0x0000002C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWPRINT.

8.4.98 SHDocVw.OLECMDID_SHOWSCRIPTERROR Constant

Pascal

```
OLECMDID_SHOWSCRIPTERROR = $00000028;
```

C++

```
OLECMDID_SHOWSCRIPTERROR = 0x00000028;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWSCRIPTERROR.

8.4.99 SHDocVw.OLECMDID_SPELL Constant

Pascal

```
OLECMDID_SPELL = $00000009;
```

C++

```
OLECMDID_SPELL = 0x00000009;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SPELL.

8.4.100 SHDocVw.OLECMDID_STOP Constant

Pascal

```
OLECMDID_STOP = $00000017;
```

C++

```
OLECMDID_STOP = 0x00000017;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_STOP.

8.4.101 SHDocVw.OLECMDID_STOPDOWNLOAD Constant

Pascal

```
OLECMDID_STOPDOWNLOAD = $0000001E;
```

C++

```
OLECMDID_STOPDOWNLOAD = 0x0000001E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_STOPDOWNLOAD.

8.4.102 SHDocVw.OLECMDID_UNDO Constant

Pascal

```
OLECMDID_UNDO = $0000000F;
```

C++

```
OLECMDID_UNDO = 0x0000000F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UNDO.

8.4.103 SHDocVw.OLECMDID_UPDATECOMMANDS Constant

Pascal

```
OLECMDID_UPDATECOMMANDS = $00000015;
```

C++

```
OLECMDID_UPDATECOMMANDS = 0x00000015;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UPDATECOMMANDS.

8.4.104 SHDocVw.OLECMDID_UPDATEPAGESTATUS Constant

Pascal

```
OLECMDID_UPDATEPAGESTATUS = $00000030;
```

C++

```
OLECMDID_UPDATEPAGESTATUS = 0x00000030;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UPDATEPAGESTATUS.

8.4.105 SHDocVw.OLECMDID_ZOOM Constant

Pascal

```
OLECMDID_ZOOM = $00000013;
```

C++

```
OLECMDID_ZOOM = 0x00000013;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ZOOM.

8.4.106 SHDocVw.READYSTATE_COMPLETE Constant

Pascal

```
READYSTATE_COMPLETE = $00000004;
```

C++

```
READYSTATE_COMPLETE = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_COMPLETE.

8.4.107 SHDocVw.READYSTATE_INTERACTIVE Constant

Pascal

```
READYSTATE_INTERACTIVE = $00000003;
```

C++

```
READYSTATE_INTERACTIVE = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_INTERACTIVE.

8.4.108 SHDocVw.READYSTATE_LOADED Constant

Pascal

```
READYSTATE_LOADED = $00000002;
```

C++

```
READYSTATE_LOADED = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_LOADED.

8.4.109 SHDocVw.READYSTATE_LOADING Constant

Pascal

```
READYSTATE_LOADING = $00000001;
```

C++

```
READYSTATE_LOADING = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_LOADING.

8.4.110 SHDocVw.READYSTATE_UNINITIALIZED Constant

Pascal

```
READYSTATE_UNINITIALIZED = $00000000;
```

C++

```
READYSTATE_UNINITIALIZED = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_UNINITIALIZED.

8.4.111 SHDocVw.REFRESH_COMPLETELY Constant

Pascal

```
REFRESH_COMPLETELY = 3;
```

C++

```
REFRESH_COMPLETELY = 3;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_COMPLETELY.

8.4.112 SHDocVw.REFRESH_CONTINUE Constant

Pascal

```
REFRESH_CONTINUE = 2;
```

C++

```
REFRESH_CONTINUE = 2;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_CONTINUE.

8.4.113 SHDocVw.REFRESH_IFEXPIRED Constant

Pascal

```
REFRESH_IFEXPIRED = 1;
```

C++

```
REFRESH_IFEXPIRED = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_IFEXPIRED.

8.4.114 SHDocVw.REFRESH_NORMAL Constant

Pascal

```
REFRESH_NORMAL = 0;
```

C++

```
REFRESH_NORMAL = 0;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_NORMAL.

8.4.115 SHDocVw.secureLockIconMixed Constant

Pascal

```
secureLockIconMixed = $00000001;
```

C++

```
secureLockIconMixed = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconMixed.

8.4.116 SHDocVw.secureLockIconSecure128Bit Constant

Pascal

```
secureLockIconSecure128Bit = $00000006;
```

C++

```
secureLockIconSecure128Bit = 0x00000006;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure128Bit.

8.4.117 SHDocVw.secureLockIconSecure40Bit Constant

Pascal

```
secureLockIconSecure40Bit = $00000003;
```

C++

```
secureLockIconSecure40Bit = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure40Bit.

8.4.118 SHDocVw.secureLockIconSecure56Bit Constant

Pascal

```
secureLockIconSecure56Bit = $00000004;
```

C++

```
secureLockIconSecure56Bit = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure56Bit.

8.4.119 SHDocVw.secureLockIconSecureFortezza Constant

Pascal

```
secureLockIconSecureFortezza = $00000005;
```

C++

```
secureLockIconSecureFortezza = 0x00000005;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecureFortezza.

8.4.120 SHDocVw.secureLockIconSecureUnknownBits Constant

Pascal

```
secureLockIconSecureUnknownBits = $00000002;
```

C++

```
secureLockIconSecureUnknownBits = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecureUnknownBits.

8.4.121 SHDocVw.secureLockIconUnsecure Constant

Pascal

```
secureLockIconUnsecure = $00000000;
```

C++

```
secureLockIconUnsecure = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconUnsecure.

8.4.122 SHDocVw.SHDocVwMajorVersion Constant

Pascal

```
SHDocVwMajorVersion = 1;
```

C++

```
SHDocVwMajorVersion = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.SHDocVwMajorVersion.

8.4.123 SHDocVw.SHDocVwMinorVersion Constant

Pascal

```
SHDocVwMinorVersion = 1;
```

C++

```
SHDocVwMinorVersion = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.SHDocVwMinorVersion.

8.4.124 SHDocVw.SWC_3RDPARTY Constant

Pascal

```
SWC_3RDPARTY = $00000002;
```

C++

```
SWC_3RDPARTY = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_3RDPARTY.

8.4.125 SHDocVw.SWC_BROWSER Constant

Pascal

```
SWC_BROWSER = $00000001;
```

C++

```
SWC_BROWSER = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_BROWSER.

8.4.126 SHDocVw.SWC_CALLBACK Constant

Pascal

```
SWC_CALLBACK = $00000004;
```

C++

```
SWC_CALLBACK = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_CALLBACK.

8.4.127 SHDocVw.SWC_EXPLORER Constant

Pascal

```
SWC_EXPLORER = $00000000;
```

C++

```
SWC_EXPLORER = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_EXPLORER.

8.4.128 SHDocVw.SWFO_COOKIEPASSED Constant

Pascal

```
SWFO_COOKIEPASSED = $00000004;
```

C++

```
SWFO_COOKIEPASSED = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_COOKIEPASSED.

8.4.129 SHDocVw.SWFO_INCLUDEPENDING Constant

Pascal

```
SWFO_INCLUDEPENDING = $00000002;
```

C++

```
SWFO_INCLUDEPENDING = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_INCLUDEPENDING.

8.4.130 SHDocVw.SWFO_NEEDDISPATCH Constant

Pascal

```
SWFO_NEEDDISPATCH = $00000001;
```

C++

```
SWFO_NEEDDISPATCH = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_NEEDDISPATCH.

9 ShellAnimations Namespace

This is namespace ShellAnimations.

Topics

Name	Description
Classes (see page 886)	The following table lists classes in this documentation.

Classes

	Name	Description
	TShellResources (see page 886)	TShellResources provides forwards compability for programs that use system animations in Windows Vista.

9.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TShellResources (see page 886)	TShellResources provides forwards compability for programs that use system animations in Windows Vista.

9.1.1 TShellResources Class

TShellResources provides forwards compability for programs that use system animations in Windows Vista.

Class Hierarchy

Pascal

```
TShellResources = class(TComponent);
```

C++

```
class TShellResources : public TComponent;
```

File

ShellAnimations

Description

Windows Vista shell animations are no longer accessible outside of the system; programs must now store local copies of these animations instead of linking to them as was done in the past.

Placing TShellResources onto a form copies the following system animation resources into the program:

- CopyFile.res
- CopyFiles.res
- DeleteFile.res
- EmptyRecycle.res
- FindComputer.res
- FindFiles.res
- FindFolder.res
- RecycleFile.res

TShellResources should only be used in programs that are run on Vista and use animations from the common library, otherwise this function adds unneeded overhead.

TAnimate

10 SimpleDS Namespace

This is namespace SimpleDS.

Topics

Name	Description
Classes (see page 888)	The following table lists classes in this documentation.

Classes

	Name	Description
	TInternalSQLDataSet (see page 888)	This is class SimpleDS.TInternalSQLDataSet.
	TSimpleDataSet (see page 896)	TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

10.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TInternalSQLDataSet (see page 888)	This is class SimpleDS.TInternalSQLDataSet.
	TSimpleDataSet (see page 896)	TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

10.1.1 TInternalSQLDataSet Class

Class Hierarchy

Pascal

```
TInternalSQLDataSet = class(TCustomSQLDataSet);
```

C++

```
class TInternalSQLDataSet : public TCustomSQLDataSet;
```

File

SimpleDS

Description

This is class SimpleDS.TInternalSQLDataSet.

10.1.1.1 TInternalSQLDataSet Members

The following tables list the members exposed by TInternalSQLDataSet.

Protected Methods

	Name	Description
	AddFieldDesc (see page 1527)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 1527)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
	CheckPrepareError (see page 1527)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
	ClearIndexDefs (see page 1528)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
	CloseCursor (see page 1528)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 1528)	This is CloseStatement, a member of class TCustomSQLDataSet.
	DefineProperties (see page 1529)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	ExecSQL (see page 1529)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 1529)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FreeBuffers (see page 1530)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 1530)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeReader (see page 1530)	This is FreeReader, a member of class TCustomSQLDataSet.
	GetCanModify (see page 1531)	This is GetCanModify, a member of class TCustomSQLDataSet.

	GetDataSource (see page 1531)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetObjectTypeNames (see page 1533)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 1534)	This is GetOutputParams, a member of class TCustomSQLDataSet.
	GetRecord (see page 1534)	This is GetRecord, a member of class TCustomSQLDataSet.
	GetRecordCount (see page 1534)	This is GetRecordCount, a member of class TCustomSQLDataSet.
	GetSortFieldNames (see page 1535)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
	InitRecord (see page 1535)	This is InitRecord, a member of class TCustomSQLDataSet.
	InternalClose (see page 1535)	This is InternalClose, a member of class TCustomSQLDataSet.
	InternalFreeCommand (see page 1535)	This is InternalFreeCommand, a member of class TCustomSQLDataSet.
	InternalHandleException (see page 1535)	This is InternalHandleException, a member of class TCustomSQLDataSet.
	InternalInitFieldDefs (see page 1536)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
	InternalOpen (see page 1536)	This is InternalOpen, a member of class TCustomSQLDataSet.
	InternalRefresh (see page 1536)	This is InternalRefresh, a member of class TCustomSQLDataSet.
	IsCursorOpen (see page 1536)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
	Loaded (see page 1537)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 1538)	This is LocateRecord, a member of class TCustomSQLDataSet.
	OpenCursor (see page 1539)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenSchema (see page 1539)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PropertyChanged (see page 1540)	This is PropertyChanged, a member of class TCustomSQLDataSet.
	PSEndTransaction (see page 1540)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 1541)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 1541)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
	PSGetAttributes (see page 1541)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 1542)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandType (see page 1542)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 1542)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 1543)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFieldsW (see page 1543)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 1544)	Returns the current parameter values of the dataset.
	PSGetQuoteCharW (see page 1544)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableNameW (see page 1544)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 1544)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 1545)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 1545)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 1546)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 1546)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 1546)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetParams (see page 1547)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 1547)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 1548)	Applies a single update to the underlying database table or tables.
	SetBufListSize (see page 1548)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetCommandText (see page 1549)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetFCommandText (see page 1549)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 1549)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetMaxBlobSize (see page 1549)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetParamsFromCursor (see page 1549)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetSortFieldNames (see page 1551)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	UpdateIndexDefs (see page 1551)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.

Protected Properties

	Name	Description
	BlobBuffer (see page 1554)	Reserves a buffer for storing BLOB values.
	CurrentBlobSize (see page 1556)	Indicates the size of the most recently read BLOB field.

	DataLink (see page 1556)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	DbxCommandType (see page 1557)	This is DbxCommandType, a member of class TCustomSQLDataSet.
	InternalConnection (see page 1559)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	NativeCommand (see page 1560)	Represents the SQL command that is sent to the server.
	ParamCount (see page 1562)	Indicates the number of parameters listed by the Params (see page 1562) property.
	ProcParams (see page 1564)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	RowsAffected (see page 1564)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 1565)	Identifies the metadata with which to populate the dataset.

Public Methods

	Name	Description
	Create (see page 1524)	This is the overview for the Create constructor overload.
	CreateBlobStream (see page 1528)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	Destroy (see page 1525)	Destroys the TCustomSQLDataSet (see page 1520) instance.
	GetBlobFieldData (see page 1530)	Retrieves the current value of a BLOB field into a buffer.
	GetCommandNames (see page 1531)	This is GetCommandNames, a member of class TCustomSQLDataSet.
	GetDetailLinkFields (see page 1531)	Lists the field components that link this dataset as a detail of a master dataset.
	GetFieldData (see page 1532)	This is the overview for the GetFieldData method overload.
	GetKeyFieldNames (see page 1533)	This is the overview for the GetKeyFieldNames method overload.
	GetQuoteChar (see page 1534)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	IsSequenced (see page 1536)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Locate (see page 1538)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 1538)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	ParamByName (see page 1539)	Locates a parameter in the Params (see page 1562) property collection.
	PrepareStatement (see page 1540)	Performs a prepare on the SQL statement.
	SetSchemaInfo (see page 1550)	Indicates whether the dataset represents metadata from the server, and if so, what kind.

Public Properties

	Name	Description
	DesignerData (see page 1557)	Stores custom data.
	IndexDefs (see page 1558)	Contains the definitions of all indexes defined on the server for the dataset.
	Prepared (see page 1563)	Specifies whether the command is prepared before execution.
	RecordCount (see page 1564)	Indicates the total number of records associated with the dataset.
	SQLConnection (see page 1566)	Specifies the SQL connection component that connects the dataset to a database server.
	TransactionLevel (see page 1567)	Indicates the transaction to which this dataset belongs.

Published Events

	Name	Description
	AfterClose (see page 1568)	Occurs after a data source connection is closed.
	AfterOpen (see page 1568)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 1568)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 1568)	Occurs after a result set is scrolled.
	BeforeClose (see page 1569)	Occurs just before a data connection is closed.
	BeforeOpen (see page 1569)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 1569)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 1569)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.

	OnCalcFields (see page 1569)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 1569)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 1554) property.
	ParseInsertSql (see page 1570)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 1554) property.
	ParseSelectSql (see page 1570)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 1554) property.
	ParseUpdateSql (see page 1570)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 1554) property.

Published Properties

	Name	Description
	Active (see page 1552)	Specifies whether or not a dataset is open.
	CommandText (see page 891)	Specifies the command the dataset executes.
	CommandType (see page 892)	Indicates the meaning of the CommandText property.
	DataSource (see page 893)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 894)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 894)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	NumericMapping (see page 1560)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 1560)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	ParamCheck (see page 895)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 895)	Represents the parameters for a query or stored procedure.
	SchemaName (see page 1565)	Specifies the name of the database schema.
	SortFieldNames (see page 896)	Indicates the sort order when CommandType is ctTable.

10.1.1.2 TInternalSQLDataSet Properties

The properties of the TInternalSQLDataSet class are listed here.

Published Properties

	Name	Description
	CommandText (see page 891)	Specifies the command the dataset executes.
	CommandType (see page 892)	Indicates the meaning of the CommandText property.
	DataSource (see page 893)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 894)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 894)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	ParamCheck (see page 895)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 895)	Represents the parameters for a query or stored procedure.
	SortFieldNames (see page 896)	Indicates the sort order when CommandType is ctTable.

10.1.1.2.1 TInternalSQLDataSet.CommandText Property

Specifies the command the dataset executes.

Pascal

```
property CommandText: UnicodeString;
```

C++

```
__property UnicodeString CommandText;
```

Description

The value of CommandText depends on the CommandType property:

When CommandType is ctQuery, CommandText is an SQL statement that the dataset executes. If the statement is a SELECT statement, the SQL dataset executes the statement when it is opened. If the statement does not return a result set, the SQL dataset executes the statement when the ExecSQL method is called.

When CommandType is ctStoredProc, CommandText is the name of a stored procedure. The SQL dataset executes the stored procedure when it is opened or when the ExecSQL method is called, depending on whether the stored procedure returns a set of records.

When CommandType is ctTable, CommandText is the name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table, sorting by the fields listed in the SortFieldNames property. The generated statement is executed when the dataset is opened.

If CommandText is an SQL statement that includes parameters or the name of a stored procedure that has parameters, use the Params property to supply parameter values.

10.1.1.2.2 TInternalSQLDataSet.CommandType Property

Indicates the meaning of the CommandText property.

Pascal

```
property CommandType: TSQLCommandType;
```

C++

```
__property TSQLCommandType CommandType;
```

Description

CommandType indicates the type of command that is contained in the CommandText property. TCustomSQLDataSet descendants set this value to the way in which they specify a query or stored procedure.

The following table lists the possible values:

CommandType	Corresponding CommandText
ctQuery	An SQL statement that the dataset executes.
ctStoredProc	The name of a stored procedure.
ctTable	The name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table.

10.1.1.2.3 TInternalSQLDataSet.DataSource Property

Links the SQL dataset to another (master) dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource links this SQL dataset to another (master) dataset that supplies values for this dataset's parameters.

When the SQL dataset's CommandText (or SQL) property specifies a parameterized query but the application does not provide values for the corresponding parameters in the Params property, the SQL dataset fetches parameter values from the dataset identified with the specified data source. When the current record in the dataset associated with DataSource changes, the SQL dataset refreshes its data to reflect the new parameter values.

CommandText (see page 1554)

SQL (see page 1663)

Params (see page 1562)

MasterSource (see page 1692)

10.1.1.2.4 TInternalSQLDataSet.GetMetadata Property

Specifies whether the SQL dataset fetches metadata information along with the data.

Pascal

```
property GetMetadata: Boolean;
```

C++

```
__property Boolean GetMetadata;
```

Description

Use GetMetadata to turn on or off the fetching of metadata on a database object. Setting GetMetadata to False will improve performance because no additional SQL will execute in order to get index information. However, setting GetMetadata to False might slow any attempts to update data using a client dataset that is linked via a dataset provider because the resolver might not generate optimized SQL to perform the update.

GetMetadata must be True to perform any operations that require an index. These operations include setting up master/detail relationships, updating data from a client dataset when the provider's UpdateMode is not upWhereAll, and delayed fetching of BLOB data.

Set GetMetadata to False if you are fetching a dataset for read-only purposes.

10.1.1.2.5 TInternalSQLDataSet.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

Params (see page 1621)

SQLConnection (see page 1566)

10.1.1.2.6 TInternalSQLDataSet.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params property is updated automatically to reflect any parameters that appear in the query specified by the CommandText property (or the SQL property for TSQLQuery) at runtime. That is, whenever the CommandText property changes, the Params property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params property in response to changes in CommandText, set ParamCheck to false.

Params (see page 1562)

CommandText (see page 1554)

SQL (see page 1663)

10.1.1.2.7 TInternalSQLDataSet.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText property (or the SQL property in TSQLQuery), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText property (or the StoredProcName property in TSQLStoredProc), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by

the DataSource property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

10.1.1.2.8 TInternalSQLDataSet.SortFieldNames Property

Indicates the sort order when CommandType is ctTable.

Pascal

```
property SortFieldNames: UnicodeString;
```

C++

```
__property UnicodeString SortFieldNames;
```

Description

Use SortFieldNames to specify the fields that should be used to order the records in the dataset. SortFieldNames is only used when CommandType is ctTable.

SortFieldNames is a semicolon-delimited list of field names. These names are used to generate the ORDER BY clause of the SQL statement the dataset creates to fetch data from a server table. Records are sorted by the first named field, and within that sort order, by the second named field, and so on.

10.1.2 TSimpleDataSet Class

TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

Class Hierarchy

Pascal

```
TSimpleDataSet = class(TCustomClientDataSet);
```

C++

```
class TSimpleDataSet : public TCustomClientDataSet;
```

File

SimpleDS

Description

TSimpleDataSet is a client dataset that uses an internal TSQLDataSet (see page 1631) and TDataSetProvider for fetching data and applying updates. It combines the fast access and easy deployment of a unidirectional dataset with a client dataset's ability to edit and navigate data.

TSimpleDataSet uses dbExpress for fast access to database information. As a client dataset, TSimpleDataSet caches that information in memory and saves any updates the application makes. With its internal dataset provider, TSimpleDataSet can apply those updates back to the database server. Thus, TSimpleDataSet works like TClientDataSet when it is connected to a local TSQLDataSet (see page 1631) via a provider, except that the source dataset and provider are internal.

TSimpleDataSet surfaces some of the properties and events of TSQLDataSet (see page 1631) so that you can specify the database server from which to fetch data, indicate what data to fetch from that server, influence what information is included in data packets, and provide input on the updating process.

In addition to using the source TSQLDataSet (see page 1631), TSimpleDataSet can read from and write to a dedicated file on disk. The internal provider and source dataset are not needed for working with file-based data, making TClientDataSet a more suitable choice if you are writing a purely file-based application. However, the ability to work with a file on disk makes TSimpleDataSet well-suited to briefcase model applications.

Types of Unidirectional Datasets

10.1.2.1 TSimpleDataSet Members

The following tables list the members exposed by TSimpleDataSet.

Protected Methods

	Name	Description
	AllocConnection (see page 900)	This is AllocConnection, a member of class TSimpleDataSet.
	AllocDataSet (see page 900)	This is AllocDataSet, a member of class TSimpleDataSet.
	AllocProvider (see page 901)	This is AllocProvider, a member of class TSimpleDataSet.
	Loaded (see page 901)	Initializes the component after the form file has been read into memory.
	Notification (see page 901)	Forwards notification messages to all owned components.
	OpenCursor (see page 902)	This is OpenCursor, a member of class TSimpleDataSet.
	PSGetCommandText (see page 902)	Gets the SQL command to be executed by PSExecute.
	SetConnection (see page 903)	This is SetConnection, a member of class TSimpleDataSet.

Public Methods

	Name	Description
	Create (see page 899)	Creates and initializes an instance of TSimpleDataSet (see page 896).
	Destroy (see page 900)	Destroys the instance of TSimpleDataSet (see page 896).

Published Events

	Name	Description
	AfterApplyUpdates (see page 931)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 931)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 933)	Occurs after an application closes a dataset.
	AfterDelete (see page 935)	Occurs after an application deletes a record.
	AfterEdit (see page 937)	Occurs after an application starts editing a record.
	AfterExecute (see page 938)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 939)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 940)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 940)	Occurs after an application inserts a new record.
	AfterOpen (see page 941)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 942)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 943)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 943)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 944)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 944)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 945)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 946)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 946)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 947)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 947)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 948)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 949)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 950)	Occurs before an application enters insert mode.
	BeforeOpen (see page 952)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 952)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 953)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 953)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 954)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 955)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 955)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 956)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 956)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 957)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 957)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 958)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Published Properties

	Name	Description
	Active (see page 904)	Specifies whether the client dataset contains data.
	Aggregates (see page 906)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 907)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 907)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	Connection (see page 908)	Identifies the TSQLConnection (see page 1580) component that connects the dataset to a database server.
	Constraints (see page 908)	Specifies record-level constraints that must be met when editing the data.
R	DataSet (see page 909)	Provides access to the internal dataset that fetches data from the server.
	DisableStringTrim (see page 909)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 910)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 911)	Points to the list of field definitions for the dataset.
	FileName (see page 914)	Specifies a file that stores the data of the client dataset.
	Filter (see page 915)	Specifies the text of the current filter.
	Filtered (see page 917)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 917)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 918)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 919)	Lists the fields to use as an index.
	IndexName (see page 920)	Identifies an index for the client dataset.
	MasterFields (see page 921)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 921)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	ObjectView (see page 922)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 923)	Indicates the number or type of records in a single data packet.
	Params (see page 924)	Contains parameter values that are sent to the provider.
	ReadOnly (see page 929)	Specifies whether the client dataset is read-only for this application.
	StoreDefs (see page 929)	Indicates whether field and index definitions are saved with the client dataset.

10.1.2.2 TSimpleDataSet.Create Constructor

Creates and initializes an instance of TSimpleDataSet (see page 896).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSimpleDataSet(TComponent * AOwner);
```

Description

Call Create to create TSimpleDataSet (see page 896) at runtime. Datasets added to forms or data modules at design time are created automatically.

AOwner is the component that is responsible for freeing the TSimpleDataSet (see page 896) instance. If AOwner is nil (Delphi) or NULL (C++), the application must explicitly free the dataset.

Create creates the internal source dataset and provider that fetch data from the database server and apply updates back to the database server.

See Also

Owner

10.1.2.3 TSimpleDataSet.Destroy Destructor

Destroys the instance of TSimpleDataSet (see page 896).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSimpleDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically. If an application creates its own instances of a dataset without assigning an Owner, however, it should call Free, which verifies that the dataset component is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

10.1.2.4 TSimpleDataSet Methods

The methods of the TSimpleDataSet class are listed here.

Protected Methods

	Name	Description
	AllocConnection (see page 900)	This is AllocConnection, a member of class TSimpleDataSet.
	AllocDataSet (see page 900)	This is AllocDataSet, a member of class TSimpleDataSet.
	AllocProvider (see page 901)	This is AllocProvider, a member of class TSimpleDataSet.
	Loaded (see page 901)	Initializes the component after the form file has been read into memory.
	Notification (see page 901)	Forwards notification messages to all owned components.
	OpenCursor (see page 902)	This is OpenCursor, a member of class TSimpleDataSet.
	PSGetCommandText (see page 902)	Gets the SQL command to be executed by PSExecute.
	SetConnection (see page 903)	This is SetConnection, a member of class TSimpleDataSet.

10.1.2.4.1 TSimpleDataSet.AllocConnection Method

Pascal

```
procedure AllocConnection; virtual;
```

C++

```
virtual __fastcall AllocConnection();
```

Description

This is AllocConnection, a member of class TSimpleDataSet.

10.1.2.4.2 TSimpleDataSet.AllocDataSet Method

Pascal

```
procedure AllocDataSet; virtual;
```

C++

```
virtual __fastcall AllocDataSet();
```

Description

This is AllocDataSet, a member of class TSimpleDataSet.

10.1.2.4.3 TSimpleDataSet.AllocProvider Method

Pascal

```
procedure AllocProvider; virtual;
```

C++

```
virtual __fastcall AllocProvider();
```

Description

This is AllocProvider, a member of class TSimpleDataSet.

10.1.2.4.4 TSimpleDataSet.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState

Create

TReader

10.1.2.4.5 TSimpleDataSet.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

10.1.2.4.6 TSimpleDataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TSimpleDataSet.

10.1.2.4.7 TSimpleDataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override;
```

C++

```
virtual __fastcall UnicodeString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

10.1.2.4.8 TSimpleDataSet.SetConnection Method

Pascal

```
procedure SetConnection(Value: TSQLConnection); virtual;
```

C++

```
virtual __fastcall SetConnection(TSQLConnection Value);
```

Description

This is SetConnection, a member of class TSimpleDataSet.

10.1.2.5 TSimpleDataSet Properties

The properties of the TSimpleDataSet class are listed here.

Published Properties

	Name	Description
	Active (see page 904)	Specifies whether the client dataset contains data.
	Aggregates (see page 906)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 907)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 907)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	Connection (see page 908)	Identifies the TSQLConnection (see page 1580) component that connects the dataset to a database server.
	Constraints (see page 908)	Specifies record-level constraints that must be met when editing the data.
R	DataSet (see page 909)	Provides access to the internal dataset that fetches data from the server.
	DisableStringTrim (see page 909)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 910)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 911)	Points to the list of field definitions for the dataset.
	FileName (see page 914)	Specifies a file that stores the data of the client dataset.
	Filter (see page 915)	Specifies the text of the current filter.
	Filtered (see page 917)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 917)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 918)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 919)	Lists the fields to use as an index.
	IndexName (see page 920)	Identifies an index for the client dataset.
	MasterFields (see page 921)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 921)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	ObjectView (see page 922)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 923)	Indicates the number or type of records in a single data packet.
	Params (see page 924)	Contains parameter values that are sent to the provider.

	ReadOnly (see page 929)	Specifies whether the client dataset is read-only for this application.
	StoreDefs (see page 929)	Indicates whether field and index definitions are saved with the client dataset.

10.1.2.5.1 TSimpleDataSet.Active Property

Specifies whether the client dataset contains data.

Pascal

```
property Active;
```

C++

```
__property Active;
```

Description

Use Active to determine whether the client dataset makes its data available. When Active is false, the client dataset is closed; It can't manipulate the data it represents. When Active is true, data can be read or edited using the client dataset.

Setting Active to true:

1Fills the client dataset with data. Depending on the other properties of the client dataset, this data comes from:

The file specified by the FileName property.

The provider specified by the ProviderName property or SetProvider method. (For some TCustomClientDataSet descendants, this is an internal provider component)

The data that was active when the client dataset was deactivated (only if the application has run continuously since the dataset was deactivated).

2Triggers a BeforeOpen event.

3Sets the State property to dsBrowse.

4Opens a cursor into the dataset.

5Triggers an After Open event.

If the client dataset has never been active previously, setting Active to true defines the structure (metadata) of the client dataset. This structure is retrieved with the data packet from the provider or stored on disk, or, if there is no data packet, it is built using the current value of the FieldDefs property or from the persistent field components listed by the Fields property.

If an error occurs during the dataset open, the dataset state is set to dsInactive, and the cursor is closed.

Setting Active to false:

1Triggers a BeforeClose event.

2Sets the State property to dsInactive.

3Closes the cursor, saving the current data to disk if the FileName property is set, and saving the current data packet to a cache so that it can be restored when the client dataset is reopened.

4Triggers an AfterClose event.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
```

```
  information it needs for incremental data fetching. Before
  fetching the next data packet, the client dataset packages
  up the key value of the last record so that the provider
  knows where to begin the next data packet. It also sends
  some application-specific information, which is stored in
  Memo1.  This method is used to pass the sql statement and the
  value of the first field for the last record to the server so
  that the server can return the correct records. The complete
  project using this code example is in
  Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
  }
  procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
  var
    LastValue: OleVariant;
    CDSClone: TClientDataSet;
  begin
    if ClientDataSet1.Active then
    begin
      CDSClone := TClientDataSet.Create(Form1);
      try
        CDSClone.CloneCursor(ClientDataSet1, True);
        { turn off FetchOnDemand so that the clone only fetches
          the last LOCAL record }
        CDSClone.FetchOnDemand := False;
        CDSClone.Last;
        LastValue := CDSClone.Fields[0].AsString;
        CDSClone.Close;
      finally
        CDSClone.Free;
      end;
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
  {
  The following code fragment illustrates how DataSets and
  DataSetCount can be used to ensure that an action is taken
  for every open dataset.  Assign CheckButtonActive as the
  AfterClose and AfterOpen event handlers for TClientDataSet1.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    I: Integer;
  begin
    if not RemoteServer1.Connected then
      RemoteServer1.Connected := True;
    ClientDataSet1.Close;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].EnableControls;
    end;
    ClientDataSet1.Open;
  end;

  procedure TForm1.Button3Click(Sender: TObject);
  var
    I: Integer;
  begin
    ClientDataSet1.Close;
```

```
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;
    Button2.Enabled := ClientDataSet1.Active;
    Button3.Enabled := ClientDataSet1.Active;
  end;
```

ProviderName

10.1.2.5.2 TSimpleDataSet.Aggregates Property

Lists all aggregates that apply to the client dataset.

Pascal

```
property Aggregates;
```

C++

```
__property Aggregates;
```

Description

Use Aggregates to define aggregates that summarize the data in the client dataset. Aggregates is a collection of TAggregate objects, each of which defines a formula for calculating an aggregate value from a group of records in the client dataset. The individual aggregates can summarize all the records in the client dataset or subgroups of records that have the same value on a set of fields. Aggregates that summarize a subgroup of records are associated with indexes, and can only be used when the associated index is current.

Do not use Aggregates to obtain summarized values maintained by the client dataset. Aggregates can contain TAggregate objects that are not currently active. Instead, use the ActiveAggs property, which represents only those TAggregate objects that are currently active.

Note: You do not need to add a TAggregate object to the Aggregates collection when you add an aggregate field using the Fields editor. The Fields editor automatically adds TAggregate objects to Aggregates for every aggregate field you define.

Obtaining Aggregate Values

Specifying Aggregates

Defining an Aggregate Field

10.1.2.5.3 TSimpleDataSet.AggregatesActive Property

Specifies whether the client dataset calculates and maintains aggregate values.

Pascal

```
property AggregatesActive;
```

C++

```
__property AggregatesActive;
```

Description

Use AggregatesActive to indicate whether the client dataset should maintain aggregate values. When AggregatesActive is false (the default), the client dataset does not support maintained aggregates. This allows the client dataset to avoid the overhead of calculating values that the application is not using. When AggregatesActive is true, the client dataset calculates and maintains all aggregate values specified by the Aggregates property that are compatible with the current index.

When aggregates are maintained, the Value method of every active aggregate object returns a value that reflects the current data in the client dataset. When users edit the data in the dataset, these values are recalculated to reflect the user's changes.

Note: To selectively enable and disable aggregates rather than turning them all on or off at once, use the Active property of individual TAggregate objects. These objects are available through the Aggregates property.

10.1.2.5.4 TSimpleDataSet.AutoCalcFields Property

Determines when the OnCalcFields event is triggered and when lookup field values are calculated.

Pascal

```
property AutoCalcFields;
```

C++

```
__property AutoCalcFields;
```

Description

Set AutoCalcFields to control when the OnCalcFields event is triggered to update calculated fields and when lookup fields are calculated.

A calculated field is one that derives its value from the values of one or more fields in the active record, sometimes with additional processing. Lookup fields are fields whose values come from a secondary dataset or lookup cache.

Note: Unidirectional datasets support calculated fields but not unidirectional fields. For unidirectional datasets, OnCalcFields only controls when calculated fields are updated.

When AutoCalcFields is true (the default), Lookup fields are recalculated and OnCalcFields is triggered when:

The dataset is opened.

The dataset is put into dsEdit state.

Focus moves from one visual control to another, or from one column to another in a data-aware grid and modifications have been made to the record.

When AutoCalcFields is false, Lookup fields are recalculated and the OnCalcFields event occurs only when

The dataset is opened.

The dataset is put into dsEdit state.

A record is retrieved from a database.

If an application permits users to change data, OnCalcFields is frequently triggered. In these cases an application may set AutoCalcFields to false to reduce the frequency with which the OnCalcFields event occurs and with which lookup values are fetched.

OnCalcFields

Calculating Fields

10.1.2.5.5 TSimpleDataSet.Connection Property

Identifies the TSQLConnection (see page 1580) component that connects the dataset to a database server.

Pascal

```
property Connection: TSQLConnection;
```

C++

```
__property TSQLConnection Connection;
```

Description

Use Connection to specify the component that connects this dataset to a database server. TSimpleDataSet (see page 896) can use either an external TSQLConnection (see page 1580) component or, if you set the ConnectionName property instead, an internally-created component. By using an external TSQLConnection (see page 1580) component, you can let multiple datasets share a single database connection.

10.1.2.5.6 TSimpleDataSet.Constraints Property

Specifies record-level constraints that must be met when editing the data.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to read or add record-level constraints to the dataset. Record-level constraints usually impose relationships between the fields in a single record. Constraints that limit the value of a single field should be added to the individual field components.

10.1.2.5.7 TSimpleDataSet.DataSet Property

Provides access to the internal dataset that fetches data from the server.

Pascal

```
property DataSet: TInternalSQLDataSet;
```

C++

```
__property TInternalSQLDataSet DataSet;
```

Description

Read (see page 3634) DataSet to access the internal dataset that TSimpleDataSet (see page 896) uses to fetch data from the server. TSimpleDataSet (see page 896) populates its Data property by fetching data from this internal dataset using an internal provider component.

Data

10.1.2.5.8 TSimpleDataSet.DisableStringTrim Property

Specifies whether trailing spaces are trimmed from field values when records are posted.

Pascal

```
property DisableStringTrim;
```

C++

```
__property DisableStringTrim;
```

Description

When DisableStringTrim is false, trailing spaces are trimmed from field values when records are posted. When DisableStringTrim is true, field values are posted exactly as typed, including any trailing spaces.

10.1.2.5.9 TSimpleDataSet.FetchOnDemand Property

Indicates whether to fetch data packets from the provider on an as-needed basis.

Pascal

```
property FetchOnDemand;
```

C++

```
__property FetchOnDemand;
```

Description

By default FetchOnDemand is true, meaning that the client dataset fetches additional packets of data as needed (for example, as a user scrolls through data, or conducts a search). If the provider does not automatically include BLOB fields or nested detail sets in data packets, setting FetchOnDemand to true causes the client dataset to fetch these values when needed as well.

Set FetchOnDemand to false only if your application contains code that explicitly fetches data packets as needed using the GetNextPacket method. Similarly, if FetchOnDemand is false and the provider does not include BLOB data by default (Options includes poFetchBlobsOnDemand), the application must fetch BLOB fields explicitly using the FetchBlobs method. If the provider does not include nested detail sets (Options includes poFetchDetailsOnDemand) and FetchOnDemand is false, the application must fetch nested details explicitly using the FetchDetails method.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;
```

```
procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;

Requesting Data from the Source Dataset or Document

10.1.2.5.10 TSimpleDataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs;
```

C++

```
__property FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

```
/*
The following example shows how to create a table.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  if (Table1->Exists)
    MessageDlg("CustInfo table already exists.", mtWarning, TMsgDlgButtons() << mbOK, 0);
  else // Don't overwrite an existing table
  {
    // describe the fields in the table
    Table1->FieldDefs->Clear();
    TFieldDef *newDef = Table1->FieldDefs->AddFieldDef();
    newDef->Name = "Field1";
    newDef->DataType = ftInteger;
    newDef->Required = true;
    newDef = Table1->FieldDefs->AddFieldDef();
    newDef->Name = "Field2";
    newDef->DataType = ftString;
    newDef->Size = 30;
    // Next, describe any indexes
    Table1->IndexDefs->Clear();
    /* the 1st index has no name because it is a Paradox primary key */
    Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
    Table1->IndexDefs->Add("Fld2Index", "Field2", TIndexOptions() << ixCaseInsensitive);
    // Now that we have specified what we want, create the table
    Table1->CreateTable();
    Table1->Active = True;
    for (int i = 1; i <= 20; i++)
      Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  }
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->Active = True;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Close();
  Table1->DeleteTable();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
```

```
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
    CreateDataSet;
  end;
end;
{ The following example shows how to create a table. }
procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Close;
  Table1.DeleteTable;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
      MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
    else
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
```

```
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.Active:= True;
end;

Creating and Deleting Tables

10.1.2.5.11 TSimpleDataSet.FileName Property

Specifies a file that stores the data of the client dataset.

Pascal

```
property FileName;
```

C++

```
__property FileName;
```

Description

Set FileName if the client dataset always reads its data from and writes its data to a single file. When FileName represents a valid file name, the client dataset automatically writes its data to that file when it is closed. When FileName specifies the name of an existing file, the client dataset automatically reads its data from that file when it is opened.

Changes are not merged into the data when it is saved to the file. This allows an application that employs the "briefcase" model to set FileName without losing updates that are destined for a database server. Single-tiered applications should explicitly merge changes before closing the dataset and saving the data to disk.

Note: When client datasets write their data to a file, they overwrite the contents of the file. Any previous contents of the file are lost.

To read from or write to a different file, use the LoadFromFile and SaveToFile methods instead. These methods can also be used to load and save data at times other than when the Active property changes.

10.1.2.5.12 TSimpleDataSet.Filter Property

Specifies the text of the current filter.

Pascal

```
property Filter;
```

C++

```
__property Filter;
```

Description

Use Filter to specify a dataset filter. When filtering is applied to a client dataset, only the records that meet a filter's conditions are available to an application. Filter contains the string that describes the filter condition. The Filter property is effective only if the Filtered property is set to True. In this case, if you change the Filter property, the filter is automatically updated.

The following table lists all the operators that can be used when defining a filter, as well as usage examples.

Operator or function comparisons	Example	Comment
=	State = 'CA'	
<>	State <> 'CA'	
>=	DateEntered >= '1/1/1998'	
<=	Total <= 100,000	
>	Percentile > 50	
<	Field1 < Field2	
BLANK	State <> 'CA' or State = BLANK	Blank records do not appear unless explicitly included in the filter.
IS NULL	Field1 IS NULL	
IS NOT NULL	Field1 IS NOT NULL.	
Logical operators		

and	State = 'CA' and Country = 'US'	
or	State = 'CA' or State = 'MA'	
not	not (State = 'CA')	
Arithmetic operators		
+	Total + 5 > 100	Applies to numbers, strings, or date (time).
-	Field1 - 7 <> 10	Applies to numbers, dates, or date (time).
*	Discount * 100 > 20	Applies to numbers only.
/	Discount > Total / 5	Applies to numbers only.
String functions		
Upper	Upper(Field1) = 'ALWAYS'	
Lower	Lower(Field1 + Field2) = 'josp'	
Substring	Substring(DateString,8) = '1998' | Substring(DateString,1,3) = 'JAN'	Extracts a substring from the string named in the first argument, starting at the position specified in the second argument. The third argument represents the number of characters copied from the string to the substring. If the third argument is missing, the string is copied from the specified position until the end.
Trim	Trim(Field1 + Field2) | Trim(Field1, '-')	Removes spaces from the beginning and the end of a string.
TrimLeft	TrimLeft(StringField) | TrimLeft(Field1, '$') <> ''	Removes spaces from the beginning of a string.
TrimRight	TrimRight(StringField) | TrimRight(Field1, '.') <> ''	Removes spaces from the end of a string.
DateTime functions		
Year	Year(DateField) = 2000	
Month	Month(DateField) <> 12	
Day	Day(DateField) = 1	
Hour	Hour(DateField) < 16	
Minute	Minute(DateField) = 0	
Second	Second(DateField) = 30	
GetDate	GetDate - DateField > 7	Represents current date and time.
Date	DateField = Date(GetDate)	Returns the date portion of a date-time value.
Time	TimeField > Time(GetDate)	Returns the time portion of a date-time value.
Miscellaneous		
Like	Memo LIKE '%filters%'	Works like SQL-92 without the ESC clause. When applied to BLOB fields, FilterOptions determines whether case is considered.
In	Day(DateField) in (1,7)	Works like SQL-92. Second argument is a list of values all with the same type.
*	State = 'M*'	Wildcard for partial comparisons.

OnFilterRecord

Filter

10.1.2.5.13 TSimpleDataSet.Filtered Property

Specifies whether or not filtering is active for a dataset.

Pascal

```
property Filtered;
```

C++

```
__property Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter property or the OnFilterRecord event handler, set Filtered to true. Because unidirectional datasets do not support filters, when you set Filtered to true on a unidirectional dataset, it raises an exception.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time an attempt is made to the read the record from the dataset while the filter is in effect, the record is not visible. If that happens, the next record that passes the filter condition becomes the active record.

Lookup

10.1.2.5.14 TSimpleDataSet.FilterOptions Property

Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.

Pascal

```
property FilterOptions;
```

C++

```
__property FilterOptions;
```

Description

Set FilterOptions to specify whether or not filtering is case insensitive when filtering on string or character fields, and whether or not partial comparisons for matching filter conditions is allowed.

Note: Because unidirectional datasets do not support filters, when you set the FilterOptions property of a unidirectional dataset,

it raises an exception.

By default, FilterOptions is set to an empty set. For filters based on string fields, set FilterOptions to foCaseInsensitive to catch all variations on a string regardless of capitalization.

When a string in a filter ends with an asterisk (*), it can be used to match partial strings. To disable matching of partial strings and to treat the asterisk as a literal character in string comparisons, set FilterOptions to include foNoPartialCompare.

```

C++

```
__property IndexDefs;
```

Description

Examine IndexDefs for index information. IndexDefs maintains an array of TIndexDef items, each of which describes an available index for the dataset. Set the value of IndexDefs before calling CreateDataSet to create a set of indexes with the client dataset.

Note: The index items in IndexDefs may not always reflect the current indexes available for a dataset. Before examining IndexDefs, call the IndexDefs.Update (Delphi) or IndexDefs->Update (C++) method to refresh the item list.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Adding a New Index

10.1.2.5.16 TSimpleDataSet.IndexFieldNames Property

Lists the fields to use as an index.

Pascal

```
property IndexFieldNames;
```

C++

```
__property IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a client dataset. Specify the name of each field on which to index the dataset, separating names with semicolons. Ordering of field names is significant.

Note: Indexes added using IndexFieldNames do not support grouping or maintained aggregates.

Tip: Use IndexFieldNames to create sort orders on the fly at runtime.

Note: The IndexFieldNames and IndexName properties are mutually exclusive. Setting one clears the other.

IndexName

Creating an Index with IndexFieldNames

Adding a New Index

10.1.2.5.17 TSimpleDataSet.IndexName Property

Identifies an index for the client dataset.

Pascal

```
property IndexName;
```

C++

```
__property IndexName;
```

Description

Use IndexName to specify an alternative index for a client dataset.If IndexName is empty, the dataset's sort order is based on the IndexFieldNames property or on its default ordering in the data packet. Default ordering is determined by the predefined index, DEFAULT_ORDER.

If IndexName contains a valid index name, then that index is used to determine sort order of records.

Note: IndexFieldNames and IndexName are mutually exclusive. Setting one clears the other.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
```

```
    for I := 0 to CDS2.IndexDefs.Count - 1 do
      if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
      begin
        { set that index as the current index for the dataset}
        CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
      end;
    CDS2.Active := True;
  end;
```

10.1.2.5.18 TSimpleDataSet.MasterFields Property

Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.

Pascal

```
property MasterFields;
```

C++

```
__property MasterFields;
```

Description

Use MasterFields after setting the MasterSource property to specify the names of one or more fields to use in establishing a detail-master relationship between this dataset and the one specified in MasterSource.

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

MasterSource

Making the Table a Detail of Another Dataset

10.1.2.5.19 TSimpleDataSet.MasterSource Property

Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.

Pascal

```
property MasterSource;
```

C++

```
__property MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this dataset and another one.

At design time choose an available data source from the MasterSource property's drop-down list in the Object Inspector.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

Tip: MasterSource establishes a master/detail relationship using the traditional linked cursor approach. Alternately, client datasets can participate in master/detail relationships using nested datasets, where the detail dataset is stored with the master table's data. To assign a client dataset's data as the value of a nested detail, use the DataSetField property.

MasterFields

Making the Table a Detail of Another Dataset

10.1.2.5.20 TSimpleDataSet.ObjectView Property

Specifies whether fields are stored hierarchically or flattened out in the Fields property.

Pascal

```
property ObjectView;
```

C++

```
__property ObjectView;
```

Description

ObjectView affects the way the Fields property stores object fields and the way data-aware grids display ADT and array fields.

When ObjectView is true, the fields are stored hierarchically in the Fields property, meaning any child fields of an object field are referenced by the object field and don't appear sequentially after the object field in the TFields:: .Fields array. When ObjectView is false, the fields are stored sequentially in the Fields property, meaning any child fields of an object field are stored after the object field as siblings in the Fields array.

When ObjectView is false, object field types, such as TADTField, are not created. This switch is provided for increased compatibility with older data-aware controls, which may not handle object field types properly. The default is false for TBDEDataSet, and true for TClientDataSet.

Note: If the ObjectView property of the dataset provided to a TClientDataSet is false, then the TClientDataSet's ObjectView property always acts as false, since the data received is already flattened.

10.1.2.5.21 TSimpleDataSet.PacketRecords Property

Indicates the number or type of records in a single data packet.

Pascal

```
property PacketRecords;
```

C++

```
__property PacketRecords;
```

Description

Use PacketRecords to specify how many records should be contained in a single packet fetched from a provider, or to indicate that the packet returned should contain only metadata.

When a client dataset is instantiated, PacketRecords is automatically set to -1, meaning that a single packet should contain all records in the dataset.

If PacketRecords is greater than zero, then it specifies the number of records to return in a packet.

To retrieve the metadata for a dataset, set PacketRecords to 0. When PacketRecords is zero, the provider returns only information from its dataset that defines the database's structure, such as table, column, constraint, and domain definitions.

Warning: When PacketRecords is greater than 0, the client dataset must fetch its data incrementally. If the provider is on a stateless application server, the client dataset must inform the provider where to start fetching data. This communication can occur using a BeforeGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
```

```
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;

10.1.2.5.22 TSimpleDataSet.Params Property

Contains parameter values that are sent to the provider.

Pascal

```
property Params;
```

C++

```
__property Params;
```

Description

Use Params to specify parameter values that the provider should pass to a source dataset. If the client dataset uses an internal provider, Params represents the values for any parameters used by the SQL statement specified by the CommandText property. If the client dataset uses an external provider that is associated with a dataset that represents a query or stored procedure, these parameter values supply input parameter values for that query or stored procedure and return any output parameters of a stored procedure. If the provider is associated with a TTable or TSQLTable component, Params limits the records that are sent in data packets. After specifying the parameters (at design time or runtime), they are sent to the provider automatically when the client dataset fetches data or executes a query or stored procedure using its Execute method.

To send parameter values to a query or stored procedure, for every parameter on the query or stored procedure for which the client dataset should send a value, add a parameter object (TParam) to Params. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the provider when the client dataset fetches data.

To send parameter values to a TTable or TSQLTable, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the provider only contain records that match the assigned value on the corresponding fields. You can achieve the same affect by applying a filter to the field, but using Params is more efficient because the data need not be included in data packets.

Note: To initialize Params so that it reflects the parameters of a provider's associated query or stored procedure, call the FetchParams method.

Warning: The parameters are only applied to the provider when a query or stored procedure is run the first time the client dataset fetches records. To change parameter values and force a query or stored procedure to be rerun with new values, use the Execute method.

C++ Examples:

```
/*
  This example saves params from a ClientDataSet, alters them
  and restores them.
*/
TParams *SavedParams;

void __fastcall TForm1::SaveParamsClick(TObject *Sender)
{
  // Save the parameters for the TDataSet
  SavedParams->Assign(CDS->Params);
}

void __fastcall TForm1::AlterParamsClick(TObject *Sender)
{
  CDS->Params->CreateParam(ftString, "stringParam", ptInput);  // you can also edit the params
in the CDS dynamically
  CDS->Params->CreateParam(ftSmallint, "smallIntParam", ptInput);
  CDS->Params->CreateParam(ftInteger, "intParam", ptInput);
  CDS->Params->CreateParam(ftWord, "wordParam", ptInput);
  CDS->Params->CreateParam(ftBoolean, "boolParam", ptInput);
  CDS->Params->CreateParam(ftFloat, "floatParam", ptInput);
  CDS->Params->CreateParam(ftCurrency, "currencyParam", ptInput);
  CDS->Params->CreateParam(ftBCD, "bcdParam", ptInput);
  CDS->Params->CreateParam(ftDate, "dateParam", ptInput);
  CDS->Params->CreateParam(ftTime, "timeParam", ptInput);
  CDS->Params->CreateParam(ftDateTime, "dateTimeParam", ptInput);
  // Call FetchParams to ensure parameters reflect server metadata
  CDS->FetchParams();
//  with CDS->Params do
  for (int I = 0; I < CDS->Params->Count; I++)
  {
    AnsiString ListItem = ListBox1->Items->Strings[I];
    switch (CDS->Params->Items[I]->DataType)
    {
      case ftString:
        CDS->Params->Items[I]->AsString = ListItem; break;
      case ftSmallint:
        CDS->Params->Items[I]->AsSmallInt = StrToIntDef(ListItem, 0); break;
      case ftInteger:
        CDS->Params->Items[I]->AsInteger = StrToIntDef(ListItem, 0); break;
      case ftWord:
        CDS->Params->Items[I]->AsWord = StrToIntDef(ListItem, 0); break;
      case ftBoolean:
        CDS->Params->Items[I]->AsBoolean = (ListItem == "True"); break;
      case ftFloat:
        CDS->Params->Items[I]->AsFloat = StrToFloat(ListItem); break;
      case ftCurrency:
        CDS->Params->Items[I]->AsCurrency = double(StrToFloat(ListItem)); break;
      case ftBCD:
        CDS->Params->Items[I]->AsBCD = StrToCurr(ListItem); break;
      case ftDate:
        CDS->Params->Items[I]->AsDate = StrToDate(ListItem); break;
      case ftTime:
        CDS->Params->Items[I]->AsTime = StrToTime(ListItem); break;
      case ftDateTime:
        CDS->Params->Items[I]->AsDateTime = StrToDateTime(ListItem); break;
```

```
    }
  }
}

void __fastcall TForm1::RestoreParamsClick(TObject *Sender)
{
  // Restore the parameters to TDataSet
  CDS->Params->AssignValues(SavedParams);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Initialize SavedParams
  SavedParams = new TParams;
  ListBox1->Items->Add("Here is a string");
  ListBox1->Items->Add("4");
  ListBox1->Items->Add("3456789");
  ListBox1->Items->Add("34");
  ListBox1->Items->Add("0");
  ListBox1->Items->Add("12.56");
  ListBox1->Items->Add("4.23");
  ListBox1->Items->Add("99.5");
  ListBox1->Items->Add("4/12/53");
  ListBox1->Items->Add("7:45:00");
  ListBox1->Items->Add("4/12/53 7:45:00");
}
```

Delphi Examples:

```
{
  This example uses the FetchParams method to sync the params
  with the server.
}
procedure TForm1.SaveParamsClick(Sender: TObject);
begin
  { Save the parameters for the TDataSet }
  SavedParams.Assign(CDS.Params);
end;

procedure TForm1.AlterParamsClick(Sender: TObject);
var
  I : Integer;
  ListItem: string;
begin
  CDS.Params.CreateParam(ftString, 'stringParam', ptInput);  // you can also edit the params
in the CDS dynamically
  CDS.Params.CreateParam(ftSmallInt, 'smallIntParam', ptInput);
  CDS.Params.CreateParam(ftInteger, 'intParam', ptInput);
  CDS.Params.CreateParam(ftWord, 'wordParam', ptInput);
  CDS.Params.CreateParam(ftBoolean, 'boolParam', ptInput);
  CDS.Params.CreateParam(ftFloat, 'floatParam', ptInput);
  CDS.Params.CreateParam(ftCurrency, 'currencyParam', ptInput);
  CDS.Params.CreateParam(ftBCD, 'bcdParam', ptInput);
  CDS.Params.CreateParam(ftDate, 'dateParam', ptInput);
  CDS.Params.CreateParam(ftTime, 'timeParam', ptInput);
  CDS.Params.CreateParam(ftDateTime, 'dateTimeParam', ptInput);
  { Call FetchParams to ensure parameters reflect server metadata }
  CDS.FetchParams;
  with CDS.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
```

```
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
        ftFloat:
          Items[I].AsFloat := StrToFloat(ListItem);
        ftCurrency:
          Items[I].AsCurrency := StrToFloat(ListItem);
        ftBCD:
          Items[I].AsBCD := StrToCurr(ListItem);
        ftDate:
          Items[I].AsDate := StrToDate(ListItem);
        ftTime:
          Items[I].AsTime := StrToTime(ListItem);
        ftDateTime:
          Items[I].AsDateTime := StrToDateTime(ListItem);
      end;
    end;
  end;
end;

procedure TForm1.RestoreParamsClick(Sender: TObject);
begin
  { Restore the parameters to TDataSet }

Setting Up a Simple Dataset

10.1.2.5.23 TSimpleDataSet.ReadOnly Property

Specifies whether the client dataset is read-only for this application.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the dataset. By default, ReadOnly is false, meaning users can potentially alter the dataset's data.

To guarantee that users cannot modify or add data to a dataset, set ReadOnly to true.

When ReadOnly is true, the dataset's CanModify property is false.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a client dataset if it gets its data from a provider. The provider's Options property can limit whether data can be edited, and if so, what types of edits are allowed.

Active

CanModify

Options

10.1.2.5.24 TSimpleDataSet.StoreDefs Property

Indicates whether field and index definitions are saved with the client dataset.

Pascal

```
property StoreDefs;
```

C++

```
__property StoreDefs;
```

Description

If StoreDefs is true, the client dataset's index and field definitions are stored with the client dataset when the form or data module that contains it is saved. Setting StoreDefs to true makes the CreateDataSet method into a one-step procedure that creates fields and indexes at runtime.

10.1.2.6 TSimpleDataSet Events

The events of the TSimpleDataSet class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 931)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 931)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 933)	Occurs after an application closes a dataset.
	AfterDelete (see page 935)	Occurs after an application deletes a record.
	AfterEdit (see page 937)	Occurs after an application starts editing a record.
	AfterExecute (see page 938)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 939)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 940)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 940)	Occurs after an application inserts a new record.
	AfterOpen (see page 941)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 942)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 943)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 943)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 944)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 944)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 945)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 946)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 946)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 947)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 947)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 948)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 949)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 950)	Occurs before an application enters insert mode.
	BeforeOpen (see page 952)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 952)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 953)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 953)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 954)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 955)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 955)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 956)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 956)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 957)	Occurs when an application inserts or appends a new dataset record.

	OnPostError (see page 957)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 958)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

10.1.2.6.1 TSimpleDataSet.AfterApplyUpdates Event

Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.

Pascal

```
property AfterApplyUpdates;
```

C++

```
__property AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to respond to custom information returned to the client dataset from a provider's AfterApplyUpdates event handler. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

6.The client dataset generates an OnReconcileError for every record that could not be applied by the provider.

10.1.2.6.2 TSimpleDataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel;
```

C++

```
__property AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
```

```
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;

10.1.2.6.3 TSimpleDataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose;
```

C++

```
__property AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;

10.1.2.6.4 TSimpleDataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete;
```

C++

```
__property AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
```

```
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
```

```
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
      Table1.Active:= True;
      for i := 1 to 20 do

10.1.2.6.5 TSimpleDataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit;
```

C++

```
__property AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

10.1.2.6.6 TSimpleDataSet.AfterExecute Event

Occurs after the client dataset receives the results from an execute command.

Pascal

```
property AfterExecute;
```

C++

```
__property AfterExecute;
```

Description

Write an AfterExecute event handler to respond to custom information returned to the client dataset from a provider's AfterExecute event handler. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing an SQL command from the client. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

10.1.2.6.7 TSimpleDataSet.AfterGetParams Event

Occurs after the client dataset receives parameter values from the provider.

Pascal

```
property AfterGetParams;
```

C++

```
__property AfterGetParams;
```

Description

Write an AfterGetParams event handler to respond to custom information returned to the client dataset from a provider's AfterGetParams event handler. AfterGetParams is part of the mechanism by which a client dataset and a provider communicate information when the client application calls FetchParams. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

10.1.2.6.8 TSimpleDataSet.AfterGetRecords Event

Occurs after the client dataset fetches a data packet from the provider.

Pascal

```
property AfterGetRecords;
```

C++

```
__property AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to respond to custom information returned to the client dataset from a provider's AfterGetRecords event handler. AfterGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1. The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.
2. The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.
3. The provider generates an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.
4. The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.
5. The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

10.1.2.6.9 TSimpleDataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert;
```

C++

```
__property AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');

10.1.2.6.10 TSimpleDataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen;
```

C++

```
__property AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
```

```
    I: Integer;
  begin
    if not RemoteServer1.Connected then
      RemoteServer1.Connected := True;
    ClientDataSet1.Close;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].EnableControls;
    end;
    ClientDataSet1.Open;
  end;

  procedure TForm1.Button3Click(Sender: TObject);
  var
    I: Integer;
  begin
    ClientDataSet1.Close;
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;

10.1.2.6.13 TSimpleDataSet.AfterRowRequest Event

Occurs after the client dataset fetches new information about the current record.

Pascal

```
property AfterRowRequest;
```

C++

```
__property AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to respond to custom information returned to the client dataset from a provider's AfterRowRequest event handler. AfterRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or

respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

Pascal

```
property AfterScroll;
```

C++

```
__property AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

10.1.2.6.15 TSimpleDataSet.BeforeApplyUpdates Event

Occurs before the client dataset applies updates to the remote server.

Pascal

```
property BeforeApplyUpdates;
```

C++

```
__property BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to send custom information to the client dataset's provider. BeforeApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider's AfterApplyUpdates event handler.

Communicating with the Client Dataset

10.1.2.6.16 TSimpleDataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel;
```

C++

```
__property BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

Insert

10.1.2.6.17 TSimpleDataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose;
```

C++

```
__property BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active

AfterClose

Close

Opening and Closing Datasets

Posting Data

10.1.2.6.18 TSimpleDataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete;
```

C++

```
__property BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

AfterDelete

Delete

Abort (see page 4047)

10.1.2.6.19 TSimpleDataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit;
```

C++

```
__property BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

10.1.2.6.20 TSimpleDataSet.BeforeExecute Event

Occurs before the client dataset executes the provider's query or stored procedure.

Pascal

```
property BeforeExecute;
```

C++

```
__property BeforeExecute;
```

Description

Write a BeforeExecute event handler to send custom information to the client dataset's provider. BeforeExecute is part of the

mechanism by which a client dataset and a provider communicate information when explicitly executing an SQL command by the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

Communicating with the Client Dataset

10.1.2.6.21 TSimpleDataSet.BeforeGetParams Event

Occurs before the client dataset fetches parameter values from the provider.

Pascal

```
property BeforeGetParams;
```

C++

```
__property BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to send custom information to the client dataset's provider. BeforeGetparams is part of the mechanism by which a client dataset and a provider communicate information when passing parameter values from the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

Communicating with the Client Dataset

10.1.2.6.22 TSimpleDataSet.BeforeGetRecords Event

Occurs before the client dataset fetches a data packet from the provider.

Pascal

```
property BeforeGetRecords;
```

C++

```
__property BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to send custom information to the client dataset's provider. BeforeGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
```

```
  knows where to begin the next data packet. It also sends
  some application-specific information, which is stored in
  Memo1.  This method is used to pass the sql statement and the
  value of the first field for the last record to the server so
  that the server can return the correct records. The complete
  project using this code example is in
  Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
  }
  procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
  var
    LastValue: OleVariant;
    CDSClone: TClientDataSet;
  begin
    if ClientDataSet1.Active then
    begin
      CDSClone := TClientDataSet.Create(Form1);
      try
        CDSClone.CloneCursor(ClientDataSet1, True);
        { turn off FetchOnDemand so that the clone only fetches
          the last LOCAL record }
        CDSClone.FetchOnDemand := False;
        CDSClone.Last;
        LastValue := CDSClone.Fields[0].AsString;
        CDSClone.Close;
      finally
        CDSClone.Free;
      end;
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
```

Communicating with the Client Dataset

10.1.2.6.23 TSimpleDataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert;
```

C++

```
__property BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
to DS the DataSource in the DBGrid to DS.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.Insert;
  CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
  CDS.Post;
end;

procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
begin
  try
  { Make sure edit field can be converted to integer --
   this will raise an exception if it can't }
    StrToInt(Edit1.Text);
  except
    Edit1.Text := '0';
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
```

```
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

Opening and Closing Datasets

10.1.2.6.25 TSimpleDataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost;
```

C++

```
__property BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
```

```
  and calls the Abort procedure if the control is empty; Abort
  cancels the post before it happens.
  }
  procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
  begin
    if DBEdit1.Text = '' then
      Abort;
    DataSet.Fields[2].AsString := DBEdit1.Text;
  end;
```

Refresh

10.1.2.6.27 TSimpleDataSet.BeforeRowRequest Event

Occurs before the client dataset fetches new information about the current record.

Pascal

```
property BeforeRowRequest;
```

C++

```
__property BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to send custom information to the client dataset's provider. BeforeRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is

passed to the provider as the OwnerData parameter.

2.The provider on the application server receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

10.1.2.6.29 TSimpleDataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields;
```

C++

```
__property OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have been synchronized with the master table.

Insert

10.1.2.6.32 TSimpleDataSet.OnFilterRecord Event

Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Pascal

```
property OnFilterRecord;
```

C++

```
__property OnFilterRecord;
```

Description

Write an OnFilterRecord event handler to specify for each record in a dataset whether it should be visible to the application. To indicate that a record passes the filter condition, the OnFilterRecord event handler must set the Accept parameter to true. To exclude a record, set the Accept parameter to false. Most TDataSet descendants (such as ADO datasets or BDE-based datasets) initialize Accept to true before calling the OnFilterRecord event handler.

Warning: Do not supply an OnFilterRecord event handler to a unidirectional dataset. Unidirectional datasets do not support filters, and assigning an OnFilterRecord event handler causes the dataset to raise an exception.

Filtering is enabled if the Filtered property is true. When an application is processing a filter, the State property for the dataset is dsFilter.

Use an OnFilterRecord event handler to filter records using a criterion that can't be implemented using the Filter property. For example, using the Filter property, field comparisons are not supported against local tables (Paradox, dBASE, Access, FoxPro), but an OnFilterRecord event handler can implement any criterion at all.

Tip: Be sure that any interactions between the Filter property and the OnFilterRecord event handler do not result in an empty filter set when they are used simultaneously in an application.

OnDeleteError

OnEditError

Post

10.1.2.6.35 TSimpleDataSet.OnReconcileError Event

Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Pascal

```
property OnReconcileError;
```

C++

```
__property OnReconcileError;
```

Description

Write an OnReconcileError event handler to respond to error conditions that arise when the Reconcile method cycles through records that could not be applied to the database. This event handles only those update errors that were not handled in an OnUpdateError event handler.

The OnReconcileError event handler is called once for each record that could not be applied to the dataset or handled by the provider.

Warning: A provider can't detect when an update conflicts with another user's changes to a memo field. This situation does not generate an OnReconcileError event.

	IGetFieldValuesAdapter (see page 1030)	This is class SiteComp.IGetFieldValuesAdapter.
	IGetHTMLStyle (see page 1031)	IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.
	IGetProducerComponent (see page 1034)	This is class SiteComp.IGetProducerComponent.
	IGetScriptObject (see page 1035)	This is class SiteComp.IGetScriptObject.
	IGetScriptObjectClassKey (see page 1036)	This is class SiteComp.IGetScriptObjectClassKey.
	IGetWebAppComponents (see page 1037)	This is class SiteComp.IGetWebAppComponents.
	IIDEFileManager (see page 1040)	This is class SiteComp.IIDEFileManager.
	IImageProducer (see page 1041)	IImageProducer is the interface for accessing the image that an adapter component supplies.
	IInternetEnvOptions (see page 1042)	This is class SiteComp.IInternetEnvOptions.
	IInternetExecuteScript (see page 1045)	This is class SiteComp.IInternetExecuteScript.
	IInternetFileTypes (see page 1047)	This is class SiteComp.IInternetFileTypes.
	IInternetScriptDebugger (see page 1048)	This is class SiteComp.IInternetScriptDebugger.
	IIsAdapterActionList (see page 1049)	This is class SiteComp.IIsAdapterActionList.
	IIterateIntfSupport (see page 1050)	This is class SiteComp.IIterateIntfSupport.
	IIterateObjectSupport (see page 1051)	This is class SiteComp.IIterateObjectSupport.
	IIteratorIndex (see page 1052)	IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.

	IIteratorSupport (see page 1054)	IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.
	INotifyAdapterChange (see page 1057)	INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.
	INotifyList (see page 1058)	INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.
	IPageDispatcher (see page 1060)	IPageDispatcher is the interface for interacting with the page dispatcher.
	IPageResult (see page 1064)	This is class SiteComp.IPageResult.
	ISessionsService (see page 1066)	ISessionsService is the interface for controlling a TSessionsService object.
	ISessionsServiceConnectID (see page 1068)	This is class SiteComp.ISessionsServiceConnectID.
	ISessionsServicePersist (see page 1070)	This is class SiteComp.ISessionsServicePersist.
	ISessionsServiceStoreID (see page 1071)	This is class SiteComp.ISessionsServiceStoreID.
	IValuesListAdapter (see page 1072)	IValuesListAdapter is the interface for supplying name/value pairs.
	IWebActionsList (see page 1076)	This is class SiteComp.IWebActionsList.
	IWebApplicationInfo (see page 1078)	IWebApplicationInfo is the interface for the application adapter.
	IWebContainerSubComponent (see page 1081)	This is class SiteComp.IWebContainerSubComponent.
	IWebDataFields (see page 1081)	This is class SiteComp.IWebDataFields.
	IWebEnabled (see page 1083)	This is class SiteComp.IWebEnabled.
	IWebFormComponentContainer (see page 1084)	This is class SiteComp.IWebFormComponentContainer.
	IWebGetActionName (see page 1086)	This is class SiteComp.IWebGetActionName.
	IWebGetDisplayLabel (see page 1088)	This is class SiteComp.IWebGetDisplayLabel.
	IWebGetDisplayWidth (see page 1089)	This is class SiteComp.IWebGetDisplayWidth.
	IWebGetFieldName (see page 1090)	This is class SiteComp.IWebGetFieldName.
	IWebGetFieldValue (see page 1091)	This is class SiteComp.IWebGetFieldValue.
	IWebGetFieldValues (see page 1092)	IWebGetFieldValues is used to iterate over multiple values associated with an adapter field.
	IWebGetMaxLength (see page 1095)	This is class SiteComp.IWebGetMaxLength.
	IWebGetSessionIDs (see page 1096)	This is class SiteComp.IWebGetSessionIDs.
	IWebImageHREF (see page 1097)	IWebImageHREF is the interface for obtaining an HREF that addresses an image.
	IWebInputName (see page 1098)	This is class SiteComp.IWebInputName.
	IWebIsDefaultAction (see page 1100)	This is class SiteComp.IWebIsDefaultAction.
	IWebIsDefaultField (see page 1101)	This is class SiteComp.IWebIsDefaultField.
	IWebSession (see page 1102)	IWebSession allows an application to terminate a Web session.
	IWebSessionAttributes (see page 1103)	This is class SiteComp.IWebSessionAttributes.
	IWebSessionID (see page 1108)	This is class SiteComp.IWebSessionID.
	IWebSessionIDs (see page 1109)	IWebSessionIDs lists the session IDs (see page 1111) for all sessions that TSessionsService stores in memory.
	IWebSessionValues (see page 1112)	This is class SiteComp.IWebSessionValues.
	IWebSetActionName (see page 1114)	This is class SiteComp.IWebSetActionName.
	IWebSetFieldName (see page 1115)	This is class SiteComp.IWebSetFieldName.
	IWebUserList (see page 1116)	IWebUserList is the interface for validating user logins and access rights.
	IWebValueIsEqual (see page 1118)	This is class SiteComp.IWebValueIsEqual.

Structs, Records, Enums

	Name	Description
	TAdapterActionHTMLElementType (see page 1121)	TAdapterActionHTMLElementType identifies the HTML type that is generated to let a user execute an adapter action.
	TAdapterDisplayCharacteristic (see page 1122)	TAdapterDisplayCharacteristics (see page 1128) describes the characteristics of the HTML generated to display information from an adapter.
	TAdapterDisplayHTMLElementType (see page 1123)	TAdapterDisplayHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TAdapterDisplayViewModeType (see page 1123)	TAdapterDisplayViewModeType identifies how an HTML control for the associated adapter field should behave.
	TAdapterInputHTMLElementType (see page 1124)	TAdapterInputHTMLElementType identifies an HTML input type that can be used to edit the value(s) associated with an adapter field.
	TAdapterItemRequestParamOption (see page 1125)	TAdapterItemRequestParamOptions (see page 1128) identifies what parameter values to include when encoding the hidden fields and HREF values that represent calls to adapter fields and actions.

	TDispatchPageFlag (see page 1126)	TDiapatchPageFlags indicates the attributes that must be present on a Web page module for it to handle a request.
	TQualifyOption (see page 1126)	This is record SiteComp.TQualifyOption.

Types

Name	Description
TAdapterDisplayCharacteristics (see page 1128)	This is type SiteComp.TAdapterDisplayCharacteristics.
TAdapterItemRequestParamOptions (see page 1128)	This is type SiteComp.TAdapterItemRequestParamOptions.
TDispatchPageFlags (see page 1129)	This is type SiteComp.TDispatchPageFlags.
TSessionID (see page 1129)	TSessionID is the type of the session identifier in a WebSnap application.

Variables

Name	Description
ExecuteScript (see page 1130)	This is variable SiteComp.ExecuteScript.
GetHTMLSampleImage (see page 1130)	This is variable SiteComp.GetHTMLSampleImage.
IDEFileManager (see page 1131)	This is variable SiteComp.IDEFileManager.
InetFileTypes (see page 1131)	This is variable SiteComp.InetFileTypes.
InternetEnvOptions (see page 1131)	This is variable SiteComp.InternetEnvOptions.
ScriptDebugger (see page 1132)	This is variable SiteComp.ScriptDebugger.

11.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractDesigntimeWarnings (see page 963)	TAbstractDesigntimeWarnings assembles design-time warning messages that appear in the HTML view of the form your application builds.
	TAbstractInetFileType (see page 965)	This is class SiteComp.TAbstractInetFileType.
	TNotifyList (see page 968)	TNotifyList is a collection of objects that should be notified of changes.
	TScriptComponent (see page 973)	This is class SiteComp.TScriptComponent.
	TScriptObject (see page 976)	This is class SiteComp.TScriptObject.

11.1.1 TAbstractDesigntimeWarnings Class

TAbstractDesigntimeWarnings assembles design-time warning messages that appear in the HTML view of the form your application builds.

Class Hierarchy

Pascal

```
TAbstractDesigntimeWarnings = class;
```

C++

```
class TAbstractDesigntimeWarnings;
```

File

SiteComp

Description

TAbstractDesigntimeWarnings is the base class for objects that collect the warning messages for an adapter page producer. At design time, as you add Web items to an adapter page producer, the page producer and the Web items you add to it write warnings to a TAbstractDesigntimeWarnings object describing any problems you can rectify (such as properties that need to be set or components that need to be added.) These warning messages appear in the preview of the emerging HTML form on the HTML view page of the editor.

See Also

TAdapterPageProducer (see page 1136)

GetDesigntimeWarnings

11.1.1.1 TAbstractDesigntimeWarnings Members

The following tables list the members exposed by TAbstractDesigntimeWarnings.

Public Methods

	Name	Description
	AddObject (see page 964)	Requests any design time warnings from a specified object.
	AddString (see page 964)	Adds a warning string to the set of warnings that appear at design time.

11.1.1.2 TAbstractDesigntimeWarnings Methods

The methods of the TAbstractDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
	AddObject (see page 964)	Requests any design time warnings from a specified object.
	AddString (see page 964)	Adds a warning string to the set of warnings that appear at design time.

11.1.1.2.1 TAbstractDesigntimeWarnings.AddObject Method

Requests any design time warnings from a specified object.

Pascal

```
procedure AddObject(AObject: TObject); virtual; abstract;
```

C++

```
virtual __fastcall AddObject(TObject * AObject) = 0;
```

Description

AddObject collects the design time warnings from the specified object by calling its GetDesigntimeWarnings method (if it has one). If the object has already been added by a previous call to AddObject, AddObject detects this and does nothing.

AObject is the Web item from which to request design-time warnings.

See Also

GetDesigntimeWarnings (see page 6384)

AddString (see page 964)

11.1.1.2.2 TAbstractDesigntimeWarnings.AddString Method

Adds a warning string to the set of warnings that appear at design time.

Pascal

```
procedure AddString(AWarning: string); virtual; abstract;
```

C++

```
virtual __fastcall AddString(UnicodeString AWarning) = 0;
```

Description

AddString adds a string to the design-time warnings object. The adapter page producer displays all such warning strings in the HTML form that appears in the HTML view of the editor.

AWarning is a warning string that describes a problem that the developer can rectify (such as an invalid property value or missing component).

See Also

TAdapterPageProducer (see page 1136)

AddObject (see page 964)

11.1.2 TAbstractInetFileType Class

Class Hierarchy

Pascal

```
TAbstractInetFileType = class(TObject);
```

C++

```
class TAbstractInetFileType : public TObject;
```

File

SiteComp

Description

This is class SiteComp.TAbstractInetFileType.

11.1.2.1 TAbstractInetFileType Members

The following tables list the members exposed by TAbstractInetFileType.

Protected Methods

	Name	Description
	GetExtCount (see page 966)	This is GetExtCount, a member of class TAbstractInetFileType.
	GetFileExt (see page 966)	This is GetFileExt, a member of class TAbstractInetFileType.
	GetTypeID (see page 967)	This is GetTypeID, a member of class TAbstractInetFileType.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.

	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	FileExt (see page 967)	This is FileExt, a member of class TAbstractInetFileType.
R	FileExtCount (see page 967)	This is FileExtCount, a member of class TAbstractInetFileType.
R	TypeID (see page 968)	This is TypeID, a member of class TAbstractInetFileType.

11.1.2.2 TAbstractInetFileType Methods

The methods of the TAbstractInetFileType class are listed here.

Protected Methods

	Name	Description
A	GetExtCount (see page 966)	This is GetExtCount, a member of class TAbstractInetFileType.
A	GetFileExt (see page 966)	This is GetFileExt, a member of class TAbstractInetFileType.
A	GetTypeID (see page 967)	This is GetTypeID, a member of class TAbstractInetFileType.

11.1.2.2.1 TAbstractInetFileType.GetExtCount Method

Pascal

```
function GetExtCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetExtCount() = 0;
```

Description

This is GetExtCount, a member of class TAbstractInetFileType.

11.1.2.2.2 TAbstractInetFileType.GetFileExt Method

Pascal

```
function GetFileExt(I: Integer): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetFileExt(int I) = 0;
```

Description

This is GetFileExt, a member of class TAbstractInetFileType.

11.1.2.2.3 TAbstractInetFileType.GetTypeID Method

Pascal

```
function GetTypeID: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetTypeID() = 0;
```

Description

This is GetTypeID, a member of class TAbstractInetFileType.

11.1.2.3 TAbstractInetFileType Properties

The properties of the TAbstractInetFileType class are listed here.

Public Properties

	Name	Description
	FileExt (see page 967)	This is FileExt, a member of class TAbstractInetFileType.
	FileExtCount (see page 967)	This is FileExtCount, a member of class TAbstractInetFileType.
	TypeID (see page 968)	This is TypeID, a member of class TAbstractInetFileType.

11.1.2.3.1 TAbstractInetFileType.FileExt Property

Pascal

```
property FileExt [I: Integer]: string;
```

C++

```
__property UnicodeString FileExt[int I];
```

Description

This is FileExt, a member of class TAbstractInetFileType.

11.1.2.3.2 TAbstractInetFileType.FileExtCount Property

Pascal

```
property FileExtCount: Integer;
```

C++

```
__property int FileExtCount;
```

Description

This is FileExtCount, a member of class TAbstractInetFileType.

11.1.2.3.3 TAbstractInetFileType.TypeID Property

Pascal

```
property TypeID: string;
```

C++

```
__property UnicodeString TypeID;
```

Description

This is TypeID, a member of class TAbstractInetFileType.

11.1.3 TNotifyList Class

TNotifyList is a collection of objects that should be notified of changes.

Class Hierarchy

Pascal

```
TNotifyList = class(TObject);
```

C++

```
class TNotifyList : public TObject;
```

File

SiteComp

Description

TNotifyList maintains a list of objects that have registered interest in change notifications. This class is used for a helper object on components that support the INotifyList (see page 1058) interface. When objects use the INotifyList (see page 1058) interface to register interest in change notifications, the component adds them to its TNotifyList instance. When those objects use the INotifyList (see page 1058) interface to unregister their interest, they are removed from the TNotifyList instance.

When the object that uses TNotifyList changes, it sends a notification to every object in the list. For example, when an adapter changes, it obtains an INotifyAdapterChange (see page 1057) interface from every object in the list. It uses this interface to call the object's NotifyAdapterChange method.

See Also

TCustomAdapter (see page 5531)

INotifyAdapterChange (see page 1057)

INotifyList (see page 1058)

11.1.3.1 TNotifyList Members

The following tables list the members exposed by TNotifyList.

Public Methods

	Name	Description
	AddNotify (see page 970)	Adds a new object to the list.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 969)	Creates an initializes an instance of TNotifyList (see page 968).
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 970)	Frees an instance of TNotifyList (see page 968).
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetCount (see page 971)	Returns the value of the Count (see page 972) property.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 971)	Returns the value of the Items (see page 972) property.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RemoveNotify (see page 971)	Removes an object from the list.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Count (see page 972)	Indicates the number of objects in the list.
R	Items (see page 972)	Lists the objects in this collection.

11.1.3.2 TNotifyList.Create Constructor

Creates an initializes an instance of TNotifyList (see page 968).

Pascal

```
constructor Create;
```

C++

```
__fastcall TNotifyList();
```

Description

WebSnap applications should not need to create instances of TNotifyList (see page 968). These objects are created by the component that uses them to keep track of objects that have registered an interest in change notifications.

See Also

NotifyList (see page 5574)

INotifyList (see page 1058)

11.1.3.3 TNotifyList.Destroy Destructor

Frees an instance of TNotifyList (see page 968).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNotifyList();
```

Description

WebSnap applications should not need to free instances of TNotifyList (see page 968), as this is handled by the components that use them. If you must free a TNotifyList (see page 968) instance, use the Free method.

See Also

System::TObject::Free (see page 3372)

11.1.3.4 TNotifyList Methods

The methods of the TNotifyList class are listed here.

Public Methods

	Name	Description
	AddNotify (see page 970)	Adds a new object to the list.
	GetCount (see page 971)	Returns the value of the Count (see page 972) property.
	GetItem (see page 971)	Returns the value of the Items (see page 972) property.
	RemoveNotify (see page 971)	Removes an object from the list.

11.1.3.4.1 TNotifyList.AddNotify Method

Adds a new object to the list.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to add an object to the end of the Items (see page 972) property array. This method is called to add objects that

want to be informed of changes to the component that uses this list.

ANotify is the object to add. This object should implement an interface that allows the associated component to inform it of changes. For example, objects in the TNotifyList (see page 968) collection maintained by an adapter support the INotifyAdapterChange (see page 1057) interface.

See Also

Items (see page 972)

RemoveNotify (see page 971)

INotifyAdapterChange (see page 1057)

11.1.3.4.2 TNotifyList.GetCount Method

Returns the value of the Count (see page 972) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 972) property. It returns the number of objects in the list.

See Also

Count (see page 972)

11.1.3.4.3 TNotifyList.GetItem Method

Returns the value of the Items (see page 972) property.

Pascal

```
function GetItem(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetItem(int Index);
```

Description

GetItem is the read implementation of the Items (see page 972) property.

Index is the zero-offset index of the item to return.

GetItem returns the specified item from the list.

See Also

Items (see page 972)

11.1.3.4.4 TNotifyList.RemoveNotify Method

Removes an object from the list.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Call RemoveNotify to remove an object from the list. This method is called to remove objects that are no longer interested in changes to the associated component.

ANotify is the object to remove. This object must have been previously added by a call to the AddNotify (see page 970) method.

See Also

Items (see page 972)

AddNotify (see page 970)

11.1.3.5 TNotifyList Properties

The properties of the TNotifyList class are listed here.

Public Properties

	Name	Description
	Count (see page 972)	Indicates the number of objects in the list.
	Items (see page 972)	Lists the objects in this collection.

11.1.3.5.1 TNotifyList.Count Property

Indicates the number of objects in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of objects in the Items (see page 972) property array. Use this value as an upper bound for the index when iterating over all the objects in the list.

See Also

Items (see page 972)

11.1.3.5.2 TNotifyList.Items Property

Lists the objects in this collection.

Pascal

```
property Items [Index: Integer]: TObject;
```

C++

```
__property TObject * Items[int Index];
```

Description

Use Items to reference an object in the list. Each item is an object that supports an interface that allows the associated

component to inform it of changes. For example, objects in the TNotifyList (see page 968) collection maintained by an adapter support the INotifyAdapterChange (see page 1057) interface.

Index is the index of the object, where 0 specifies the first item, 1 specifies the second item, and so on. The Count (see page 972) property gives an upper bound for this index.

Note: In Delphi, Items is the default property of TNotifyList (see page 968). That means the property name may be omitted in code.

See Also

Count (see page 972)

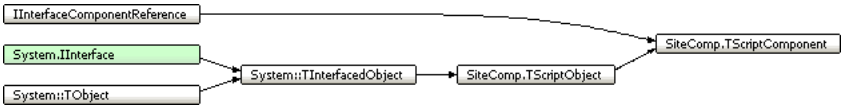
AddNotify (see page 970)

RemoveNotify (see page 971)

INotifyAdapterChange (see page 1057)

11.1.4 TScriptComponent Class

Class Hierarchy



Pascal

```
TScriptComponent = class(TScriptObject, IInterfaceComponentReference);
```

C++

```
class TScriptComponent : public TScriptObject, public IInterfaceComponentReference;
```

File

SiteComp

Description

This is class SiteComp.TScriptComponent.

11.1.4.1 TScriptComponent Members

The following tables list the members exposed by TScriptComponent.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetComponent (see page 975)	Returns a reference to the component associated by the implementing class.

	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 975)	This is Create, a member of class TScriptComponent.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Obj (see page 975)	This is Obj, a member of class TScriptComponent.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

11.1.4.2 TScriptComponent.Create Constructor

Pascal

```
constructor Create(AObject: TComponent); virtual;
```

C++

```
virtual __fastcall TScriptComponent(TComponent * AObject);
```

Description

This is Create, a member of class TScriptComponent.

11.1.4.3 TScriptComponent Methods

The methods of the TScriptComponent class are listed here.

Protected Methods

	Name	Description
	GetComponent (see page 975)	Returns a reference to the component associated by the implementing class.

11.1.4.3.1 TScriptComponent.GetComponent Method

Returns a reference to the component associated by the implementing class.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

GetComponent returns a TComponent value that is associated with the implementing class. For example, the TComponent class itself implements the GetComponent to return a pointer to itself.

See Also

TComponent

11.1.4.4 TScriptComponent Properties

The properties of the TScriptComponent class are listed here.

Public Properties

	Name	Description
R	Obj (see page 975)	This is Obj, a member of class TScriptComponent.

11.1.4.4.1 TScriptComponent.Obj Property

Pascal

```
property Obj: TComponent;
```

C++

```
__property TComponent * Obj;
```

Description

This is Obj, a member of class TScriptComponent.

11.1.5 TScriptObject Class

Class Hierarchy

Pascal

```
TScriptObject = class(TInterfacedObject);
```

C++

```
class TScriptObject : public TInterfacedObject;
```

File

SiteComp

Description

This is class SiteComp.TScriptObject.

11.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IActionImageProducer (see page 978)	IActionImageProducer is the interface for accessing the image or set of images that represent an adapter action.
	IAdapterAccess (see page 981)	This is class SiteComp.IAdapterAccess.
	IAdapterActionAccess (see page 982)	This is class SiteComp.IAdapterActionAccess.
	IAdapterActionAttributes (see page 983)	This is class SiteComp.IAdapterActionAttributes.
	IAdapterDispatcher (see page 985)	IAdapterDispatcher is the interface for interacting with the adapter dispatcher.
	IAdapterDispatchParams (see page 987)	IAdapterDispatchParams describes adapter action parameters and adapter field values.
	IAdapterError (see page 992)	IAdapterError is the interface for retrieving adapter error information.
	IAdapterErrors (see page 995)	IAdapterErrors is implemented by adapter errors objects.
	IAdapterFieldAccess (see page 998)	This is class SiteComp.IAdapterFieldAccess.
	IAdapterFieldAttributes (see page 999)	This is class SiteComp.IAdapterFieldAttributes.
	IAdapterHiddenField (see page 1001)	This is class SiteComp.IAdapterHiddenField.
	IAdapterHiddenFields (see page 1003)	This is class SiteComp.IAdapterHiddenFields.
	IAdapterItemRequestParams (see page 1005)	IAdapterItemRequestParams is the interface for reading the parameters for an adapter field or action request.
	IAdapterMode (see page 1009)	This is class SiteComp.IAdapterMode.
	IAdapterRequestHandler (see page 1012)	IAdapterRequestHandler handles requests to execute an adapter action or retrieve the value of an image field.
	IAsFormatted (see page 1013)	This is class SiteComp.IAsFormatted.
	IDefaultPageFileName (see page 1014)	This is class SiteComp.IDefaultPageFileName.
	IFieldValuesAdapter (see page 1015)	This is class SiteComp.IFieldValuesAdapter.
	IFindIncludeFile (see page 1016)	This is class SiteComp.IFindIncludeFile.
	IGetAdapterActions (see page 1017)	This is class SiteComp.IGetAdapterActions.
	IGetAdapterDisplayCharacteristics (see page 1018)	This is class SiteComp.IGetAdapterDisplayCharacteristics.
	IGetAdapterErrors (see page 1019)	This is class SiteComp.IGetAdapterErrors.
	IGetAdapterFields (see page 1020)	This is class SiteComp.IGetAdapterFields.
	IGetAdapterHiddenFields (see page 1021)	This is class SiteComp.IGetAdapterHiddenFields.
	IGetAdapterImage (see page 1022)	This is class SiteComp.IGetAdapterImage.
	IGetAdapterItemRequestParams (see page 1023)	This is class SiteComp.IGetAdapterItemRequestParams.
	IGetAdapterRequestDefaultResponse (see page 1024)	This is class SiteComp.IGetAdapterRequestDefaultResponse.
	IGetAdapterValuesList (see page 1026)	This is class SiteComp.IGetAdapterValuesList.
	IGetDefaultAction (see page 1027)	This is class SiteComp.IGetDefaultAction.
	IGetDesigntimeWarnings (see page 1029)	This is class SiteComp.IGetDesigntimeWarnings.
	IGetFieldValuesAdapter (see page 1030)	This is class SiteComp.IGetFieldValuesAdapter.
	IGetHTMLStyle (see page 1031)	IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.
	IGetProducerComponent (see page 1034)	This is class SiteComp.IGetProducerComponent.
	IGetScriptObject (see page 1035)	This is class SiteComp.IGetScriptObject.
	IGetScriptObjectClassKey (see page 1036)	This is class SiteComp.IGetScriptObjectClassKey.
	IGetWebAppComponents (see page 1037)	This is class SiteComp.IGetWebAppComponents.
	IIDEFileManager (see page 1040)	This is class SiteComp.IIDEFileManager.
	IImageProducer (see page 1041)	IImageProducer is the interface for accessing the image that an adapter component supplies.
	IInternetEnvOptions (see page 1042)	This is class SiteComp.IInternetEnvOptions.
	IInternetExecuteScript (see page 1045)	This is class SiteComp.IInternetExecuteScript.

	IInternetFileTypes (see page 1047)	This is class SiteComp.IInternetFileTypes.
	IInternetScriptDebugger (see page 1048)	This is class SiteComp.IInternetScriptDebugger.
	IIsAdapterActionList (see page 1049)	This is class SiteComp.IIsAdapterActionList.
	IIterateIntfSupport (see page 1050)	This is class SiteComp.IIterateIntfSupport.
	IIterateObjectSupport (see page 1051)	This is class SiteComp.IIterateObjectSupport.
	IIteratorIndex (see page 1052)	IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.
	IIteratorSupport (see page 1054)	IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.
	INotifyAdapterChange (see page 1057)	INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.
	INotifyList (see page 1058)	INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.
	IPageDispatcher (see page 1060)	IPageDispatcher is the interface for interacting with the page dispatcher.
	IPageResult (see page 1064)	This is class SiteComp.IPageResult.
	ISessionsService (see page 1066)	ISessionsService is the interface for controlling a TSessionsService object.
	ISessionsServiceConnectID (see page 1068)	This is class SiteComp.ISessionsServiceConnectID.
	ISessionsServicePersist (see page 1070)	This is class SiteComp.ISessionsServicePersist.
	ISessionsServiceStoreID (see page 1071)	This is class SiteComp.ISessionsServiceStoreID.
	IValuesListAdapter (see page 1072)	IValuesListAdapter is the interface for supplying name/value pairs.
	IWebActionsList (see page 1076)	This is class SiteComp.IWebActionsList.
	IWebApplicationInfo (see page 1078)	IWebApplicationInfo is the interface for the application adapter.
	IWebContainerSubComponent (see page 1081)	This is class SiteComp.IWebContainerSubComponent.
	IWebDataFields (see page 1081)	This is class SiteComp.IWebDataFields.
	IWebEnabled (see page 1083)	This is class SiteComp.IWebEnabled.
	IWebFormComponentContainer (see page 1084)	This is class SiteComp.IWebFormComponentContainer.
	IWebGetActionName (see page 1086)	This is class SiteComp.IWebGetActionName.
	IWebGetDisplayLabel (see page 1088)	This is class SiteComp.IWebGetDisplayLabel.
	IWebGetDisplayWidth (see page 1089)	This is class SiteComp.IWebGetDisplayWidth.
	IWebGetFieldName (see page 1090)	This is class SiteComp.IWebGetFieldName.
	IWebGetFieldValue (see page 1091)	This is class SiteComp.IWebGetFieldValue.
	IWebGetFieldValues (see page 1092)	IWebGetFieldValues is used to iterate over multiple values associated with an adapter field.
	IWebGetMaxLength (see page 1095)	This is class SiteComp.IWebGetMaxLength.
	IWebGetSessionIDs (see page 1096)	This is class SiteComp.IWebGetSessionIDs.
	IWebImageHREF (see page 1097)	IWebImageHREF is the interface for obtaining an HREF that addresses an image.
	IWebInputName (see page 1098)	This is class SiteComp.IWebInputName.
	IWebIsDefaultAction (see page 1100)	This is class SiteComp.IWebIsDefaultAction.
	IWebIsDefaultField (see page 1101)	This is class SiteComp.IWebIsDefaultField.
	IWebSession (see page 1102)	IWebSession allows an application to terminate a Web session.
	IWebSessionAttributes (see page 1103)	This is class SiteComp.IWebSessionAttributes.
	IWebSessionID (see page 1108)	This is class SiteComp.IWebSessionID.
	IWebSessionIDs (see page 1109)	IWebSessionIDs lists the session IDs (see page 1111) for all sessions that TSessionsService stores in memory.
	IWebSessionValues (see page 1112)	This is class SiteComp.IWebSessionValues.
	IWebSetActionName (see page 1114)	This is class SiteComp.IWebSetActionName.
	IWebSetFieldName (see page 1115)	This is class SiteComp.IWebSetFieldName.
	IWebUserList (see page 1116)	IWebUserList is the interface for validating user logins and access rights.
	IWebValueIsEqual (see page 1118)	This is class SiteComp.IWebValueIsEqual.

11.2.1 IActionImageProducer Interface

IActionImageProducer is the interface for accessing the image or set of images that represent an adapter action.

Class Hierarchy

Pascal

```
IActionImageProducer = interface(IImageProducer);
```

C++

```
__interface IActionImageProducer : public IImageProducer;
```

File

SiteComp

Description

IActionImageProducer is the interface used to access the object that supplies images for an adapter action. This interface can supply a single image for the action, or a set of related images that can be used when an HTML control changes its appearance in response to user actions.

IActionImageProducer does not directly supply the HREF for the image or images it represents. Instead, it supplies the interface for another object. That object may generate the image, or it may simply generate an HREF that addresses the object that generates the image. This extra level of indirection allows the object that implements IActionImageProducer to work with multiple adapter fields that produce a variety of images.

Note: Method declarations that use IActionImageProducer use the _di_IActionImageProducer type instead. This type is a DelphiInterface (see page 3256) wrapper around the IActionImageProducer interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IActionImageProducer >
_di_IActionImageProducer;
```

TCustomAdapterActionButton (see page 6430)

11.2.1.1 IActionImageProducer Members

The following tables list the members exposed by IActionImageProducer.

Public Methods

	Name	Description
	GetAdapterEventImage (see page 980)	Returns the object that is responsible for providing a specified image from a set of related images.
	GetAdapterImage (see page 1042)	Returns the object that is responsible for providing a specified image.
	GetDisplayStyle (see page 980)	Indicates what type of images this interface can be used to access.

11.2.1.2 IActionImageProducer Methods

The methods of the IActionImageProducer class are listed here.

Public Methods

	Name	Description
	GetAdapterEventImage (see page 980)	Returns the object that is responsible for providing a specified image from a set of related images.

	GetDisplayStyle (see page 980)	Indicates what type of images this interface can be used to access.

11.2.1.2.1 IActionImageProducer.GetAdapterEventImage Method

Returns the object that is responsible for providing a specified image from a set of related images.

Pascal

```
function GetAdapterEventImage(const AComponentName: WideString; const AEvent: WideString;
const ACaption: WideString): TObject;
```

C++

```
__fastcall TObject * GetAdapterEventImage(const BSTR AComponentName, const BSTR AEvent, const
BSTR ACaption);
```

Description

GetAdapterEventImage returns the object that supplies an HREF for the specified image. That object can supply the HREF in one of two ways:

It can implement the IWebImageHREF (see page 1097) interface.

It can be the object that produces the image in response to request messages. In this case, the adapter dispatcher's EncodeAdapterItemRequestAsHREF method generates the HREF to address this object.

AComponentName is the name of the component that is requesting the image. GetAdapterEventImage can use this parameter to determine which of several objects is appropriate for supplying the image.

AEvent identifies the user event that the image should reflect. This parameter is used when the GetDisplayStyle (see page 980) method returns 'EventImages'. If AEvent is an empty string, GetAdapterEventImage returns the object that supplies the base image. If AEvent is not empty, GetAdapterEventImage returns the object that supplies the version of the image to use in response to the associated user action. Possible values are 'onmouseover', 'onmouseout', and 'onmousedown'.

ACaption is a text label that describes the desired image. GetAdapterEventImage can use this parameter to determine which of several objects is appropriate for supplying the image.

See Also

IWebImageHREF (see page 1097)

EncodeAdapterItemRequestAsHREF (see page 6173)

GetAdapterImage (see page 1042)

GetDisplayStyle (see page 980)

11.2.1.2.2 IActionImageProducer.GetDisplayStyle Method

Indicates what type of images this interface can be used to access.

Pascal

```
function GetDisplayStyle(Sender: TComponent): string;
```

C++

```
__fastcall UnicodeString GetDisplayStyle(TComponent * Sender);
```

Description

GetDisplayStyle returns either 'Image' or 'EventImages', depending on whether it can supply a single image for an adapter action and caption, or multiple images that reflect various user events.

If GetDisplayStyle returns 'Image', use the GetAdapterImage (see page 1042) method to obtain an interface for the image

object. If GetDisplayStyle returns 'EventImages', use the GetAdapterEventImage (see page 980) method to obtain an interface for the image object.

When a TAdapterActionButton component uses this interface for its ImageProducer property, its DisplayType property should be compatible with the display style this method returns. That is, if this method returns 'Image', the adapter action button should have a DisplayType of ctImage or ctDefault. If this method returns 'EventImages', the adapter action button can have a DisplayType of ctImage, ctEventImages, or ctDefault.

Sender is the component that is requesting the image.

See Also

DisplayType (see page 6439)

GetAdapterEventImage (see page 980)

GetAdapterImage (see page 1042)

11.2.2 IAdapterAccess Interface

Class Hierarchy

Pascal

```
IAdapterAccess = interface;
```

C++

```
__interface IAdapterAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterAccess.

11.2.2.1 IAdapterAccess Members

The following tables list the members exposed by IAdapterAccess.

Public Methods

	Name	Description
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.

11.2.2.2 IAdapterAccess Methods

The methods of the IAdapterAccess class are listed here.

Public Methods

	Name	Description
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.

11.2.2.2.1 IAdapterAccess.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class IAdapterAccess.

11.2.2.2.2 IAdapterAccess.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class IAdapterAccess.

11.2.2.2.3 IAdapterAccess.HasViewAccess Method

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

This is HasViewAccess, a member of class IAdapterAccess.

11.2.3 IAdapterActionAccess Interface

Class Hierarchy

Pascal

```
IAdapterActionAccess = interface;
```

C++

```
__interface IAdapterActionAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterActionAccess.

11.2.3.1 IAdapterActionAccess Members

The following tables list the members exposed by IAdapterActionAccess.

Public Methods

	Name	Description
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

11.2.3.2 IAdapterActionAccess Methods

The methods of the IAdapterActionAccess class are listed here.

Public Methods

	Name	Description
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

11.2.3.2.1 IAdapterActionAccess.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class IAdapterActionAccess.

11.2.4 IAdapterActionAttributes Interface

Class Hierarchy

SiteComp.IAdapterActionAttributes

Pascal

```
IAdapterActionAttributes = interface;
```

C++

```
__interface IAdapterActionAttributes;
```

File

SiteComp

Description

This is class SiteComp.IAdapterActionAttributes.

11.2.4.1 IAdapterActionAttributes Members

The following tables list the members exposed by IAdapterActionAttributes.

Public Methods

	Name	Description
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.

Public Properties

	Name	Description
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

11.2.4.2 IAdapterActionAttributes Methods

The methods of the IAdapterActionAttributes class are listed here.

Public Methods

	Name	Description
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.

11.2.4.2.1 IAdapterActionAttributes.GetVisible Method

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

This is GetVisible, a member of class IAdapterActionAttributes.

11.2.4.3 IAdapterActionAttributes Properties

The properties of the IAdapterActionAttributes class are listed here.

Public Properties

	Name	Description
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

11.2.4.3.1 IAdapterActionAttributes.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IAdapterActionAttributes.

11.2.5 IAdapterDispatcher Interface

IAdapterDispatcher is the interface for interacting with the adapter dispatcher.

Class Hierarchy

Pascal

```
IAdapterDispatcher = interface(IWebRequestHandler);
```

C++

```
__interface IAdapterDispatcher : public IWebRequestHandler;
```

File

SiteComp

Description

The TAdapterDispatcher component implements IAdapterDispatcher. This interface, which the TWebAppComponents object publishes, allows the WebSnap application to dispatch request messages that represent HTML form submissions and requests for dynamic images that can be resolved using adapter actions and fields. It also encodes the hidden fields and HREF values that are used to make those calls to adapter fields and actions.

Note: In C++, method declarations that use IAdapterDispatcher use the _di_IAdapterDispatcher type instead. This type is a DelphiInterface (see page 3256) wrapper around the IAdapterDispatcher interface:

Note: typedef System::DelphiInterface (see page 3256)< IAdapterDispatcher > _di_IAdapterDispatcher;

See Also

TAdapterDispatcher (see page 6148)

TCustomWebAppComponents (see page 6201)

TWebAppComponents (see page 6243)

11.2.5.1 IAdapterDispatcher Members

The following tables list the members exposed by IAdapterDispatcher.

Public Methods

	Name	Description
	EncodeAdapterItemRequestAsFieldValue (see page 986)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 986)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 987)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

11.2.5.2 IAdapterDispatcher Methods

The methods of the IAdapterDispatcher class are listed here.

Public Methods

	Name	Description
	EncodeAdapterItemRequestAsFieldValue (see page 986)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 986)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 987)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

11.2.5.2.1 IAdapterDispatcher.EncodeAdapterItemRequestAsFieldValue Method

Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.

Pascal

```
function EncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall UnicodeString EncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Call EncodeAdapterItemRequestAsFieldValue to encode the adapter action or image field parameters as they should appear as field values in form submissions. That is, the resulting parameter string has a form such as '?param1=value1&param2=value2'.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 987)

EncodeAdapterItemRequestAsHREF (see page 986)

11.2.5.2.2 IAdapterDispatcher.EncodeAdapterItemRequestAsHREF Method

Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.

Pascal

```
function EncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall UnicodeString EncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Call EncodeAdapterItemRequestAsHREF to encode the adapter action or image field parameters as they should appear as parameters to an anchor tag in an HTML form.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 987)

EncodeAdapterItemRequestAsFieldValue (see page 986)

11.2.5.2.3 IAdapterDispatcher.GetAdapterItemRequestParams Method

Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

Pascal

```
procedure GetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; AParams: IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(IUnknown AHandler, TAdapterItemRequestParamOptions
AOptions, IAdapterItemRequestParams AParams);
```

Description

Call GetAdapterItemRequestParams to retrieve the adapter action and image field parameters.

AHandler is the interface of the adapter whose action or field requires the parameters.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. GetAdapterItemRequestParams uses this interface to write the parameter values.

See Also

EncodeAdapterItemRequestAsHREF (see page 986)

EncodeAdapterItemRequestAsFieldValue (see page 986)

11.2.6 IAdapterDispatchParams Interface

IAdapterDispatchParams describes adapter action parameters and adapter field values.

Class Hierarchy

Pascal

```
IAdapterDispatchParams = interface;
```

C++

```
__interface IAdapterDispatchParams;
```

File

SiteComp

Description

Use IAdapterDispatchParams to obtain context information that is needed to execute an adapter action or to obtain the value of an image field from an adapter. When server-side script in a WebSnap application executes an adapter action or requests the value of an image field, an object that implements this interface is created to store information about the adapter that can perform the specified task and the parameters that must be passed to the adapter for it to do so. This interface is then passed to the adapter action's HandleRequest method so that it can look up the adapter and the parameters.

Note: In C++, method declarations that use IAdapterDispatchParams use the _di_IAdapterDispatchParams type instead. This type is a DelphiInterface (see page 3256) wrapper around the IAdapterDispatchParams interface:

Note: typedef System::DelphiInterface (see page 3256)< IAdapterDispatchParams > _di_IAdapterDispatchParams;

See Also

IAdapterRequestHandler (see page 1012)

TAdapterDispatchParams (see page 6153)

TBaseAdapterAction (see page 5447)

11.2.6.1 IAdapterDispatchParams Members

The following tables list the members exposed by IAdapterDispatchParams.

Public Methods

	Name	Description
	GetHandler (see page 989)	Returns the value of the Handler (see page 990) property.
	GetObjectIdentifier (see page 989)	Returns the value of the ObjectIdentifier (see page 990) property.
	GetParams (see page 989)	Returns the value of the Params (see page 991) property.
	GetRequestIdentifier (see page 989)	Returns the value of the RequestIdentifier (see page 991) property.

Public Properties

	Name	Description
R	Handler (see page 990)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 990)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 991)	Indicates the parameter values to use when executing the action or looking up the image.
R	RequestIdentifier (see page 991)	Identifies the type of the request identified by the ObjectIdentifier (see page 990) property.

11.2.6.2 IAdapterDispatchParams Methods

The methods of the IAdapterDispatchParams class are listed here.

Public Methods

	Name	Description
	GetHandler (see page 989)	Returns the value of the Handler (see page 990) property.
	GetObjectIdentifier (see page 989)	Returns the value of the ObjectIdentifier (see page 990) property.
	GetParams (see page 989)	Returns the value of the Params (see page 991) property.

	GetRequestIdentifier (see page 989)	Returns the value of the RequestIdentifier (see page 991) property.

11.2.6.2.1 IAdapterDispatchParams.GetHandler Method

Returns the value of the Handler (see page 990) property.

Pascal

```
function GetHandler: TObject;
```

C++

```
__fastcall TObject * GetHandler();
```

Description

GetHandler is the read implementation of the Handler (see page 990) property.

See Also

Handler (see page 990)

11.2.6.2.2 IAdapterDispatchParams.GetObjectIdentifier Method

Returns the value of the ObjectIdentifier (see page 990) property.

Pascal

```
function GetObjectIdentifier: string;
```

C++

```
__fastcall UnicodeString GetObjectIdentifier();
```

Description

GetObjectIdentifier is the read implementation of the ObjectIdentifier (see page 990) property.

See Also

ObjectIdentifier (see page 990)

11.2.6.2.3 IAdapterDispatchParams.GetParams Method

Returns the value of the Params (see page 991) property.

Pascal

```
function GetParams: TStrings;
```

C++

```
__fastcall TStrings GetParams();
```

Description

GetParams is the read implementation of the Params (see page 991) property.

See Also

Params (see page 991)

11.2.6.2.4 IAdapterDispatchParams.GetRequestIdentifier Method

Returns the value of the RequestIdentifier (see page 991) property.

Pascal

```
function GetRequestIdentifier: string;
```

C++

```
__fastcall UnicodeString GetRequestIdentifier();
```

Description

GetRequestIdentifier is the read implementation of the RequestIdentifier (see page 991) property.

See Also

RequestIdentifier (see page 991)

11.2.6.3 IAdapterDispatchParams Properties

The properties of the IAdapterDispatchParams class are listed here.

Public Properties

	Name	Description
R	Handler (see page 990)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 990)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 991)	Indicates the parameter values to use when executing the action or looking up the image.
R	RequestIdentifier (see page 991)	Identifies the type of the request identified by the ObjectIdentifier (see page 990) property.

11.2.6.3.1 IAdapterDispatchParams.Handler Property

Indicates the adapter object that can handle the current request.

Pascal

```
property Handler: TObject;
```

C++

```
__property TObject * Handler;
```

Description

Read (see page 3634) Handler to access the adapter that can execute the action or supply the image that is requested.

See Also

ObjectIdentifier (see page 990)

RequestIdentifier (see page 6160)

11.2.6.3.2 IAdapterDispatchParams.ObjectIdentifier Property

Specifies the name of the action to execute or the field to retrieve.

Pascal

```
property ObjectIdentifier: string;
```

C++

```
__property UnicodeString ObjectIdentifier;
```

Description

Read (see page 3634) ObjectIdentifier to determine the name of the requested action or field. The interpretation of this value is the responsibility of the object specified by the Handler (see page 990) parameter.

See Also

Handler (see page 990)

RequestIdentifier (see page 6160)

11.2.6.3.3 IAdapterDispatchParams.Params Property

Indicates the parameter values to use when executing the action or looking up the image.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Read (see page 3634) Params to determine the parameters that the adapter action can use to perform its task. Each string in this string list has the form Name=Value, where Name is the name of a parameter and Value is its value.

The interpretation of the parameter values is up to the adapter specified by the Handler (see page 990) object or to the adapter action object that handles the request.

See Also

Handler (see page 990)

ObjectIdentifier (see page 6159)

11.2.6.3.4 IAdapterDispatchParams.RequestIdentifier Property

Identifies the type of the request identified by the ObjectIdentifier (see page 990) property.

Pascal

```
property RequestIdentifier: string;
```

C++

```
__property UnicodeString RequestIdentifier;
```

Description

Read (see page 3634) RequestIdentifier to determine the type of processing the current request requires. For example, the RequestIdentifier may identify the request as a request for the value of an image field or a request to execute an action.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 990) parameter.

See Also

Handler (see page 990)

ObjectIdentifier (see page 6159)

11.2.7 IAdapterError Interface

IAdapterError is the interface for retrieving adapter error information.

Class Hierarchy

Pascal

```
IAdapterError = interface;
```

C++

```
__interface IAdapterError;
```

File

SiteComp

Description

The TAdapterError class implements IAdapterError, which is managed by TBaseAdapterErrorsList and its descendant classes. Applications uses IAdapterError to retrieve information relating to an adapter error.

See Also

TAdapterError (see page 5256)

TBaseAdapterErrorsList (see page 5479)

11.2.7.1 IAdapterError Members

The following tables list the members exposed by IAdapterError.

Public Methods

	Name	Description
	GetErrorText (see page 993)	Returns the value of the ErrorText (see page 994) property.
	GetField (see page 993)	Returns the value of the Field (see page 994) property.
	GetID (see page 993)	Returns the value of the ID (see page 994) property.

Public Properties

	Name	Description
R	ErrorText (see page 994)	Returns text describing the error.
R	Field (see page 994)	Returns text describing the error.
R	ID (see page 994)	Returns error ID.

11.2.7.2 IAdapterError Methods

The methods of the IAdapterError class are listed here.

Public Methods

	Name	Description
	GetErrorText (see page 993)	Returns the value of the ErrorText (see page 994) property.
	GetField (see page 993)	Returns the value of the Field (see page 994) property.

	GetID (see page 993)	Returns the value of the ID (see page 994) property.

11.2.7.2.1 IAdapterError.GetErrorText Method

Returns the value of the ErrorText (see page 994) property.

Pascal

```
function GetErrorText: string;
```

C++

```
__fastcall UnicodeString GetErrorText();
```

Description

GetErrorText is the read implementation of the ErrorText (see page 994) property.

See Also

ErrorText (see page 994)

11.2.7.2.2 IAdapterError.GetField Method

Returns the value of the Field (see page 994) property.

Pascal

```
function GetField: TComponent;
```

C++

```
__fastcall TComponent * GetField();
```

Description

GetField is the read implementation of the Field (see page 994) property.

See Also

Field (see page 994)

11.2.7.2.3 IAdapterError.GetID Method

Returns the value of the ID (see page 994) property.

Pascal

```
function GetID: integer;
```

C++

```
__fastcall int GetID();
```

Description

GetID is the read implementation of the ID (see page 994) property.

See Also

ID (see page 994)

11.2.7.3 IAdapterError Properties

The properties of the IAdapterError class are listed here.

Public Properties

	Name	Description
	ErrorText (see page 994)	Returns text describing the error.
	Field (see page 994)	Returns text describing the error.
	ID (see page 994)	Returns error ID.

11.2.7.3.1 IAdapterError.ErrorText Property

Returns text describing the error.

Pascal

```
property ErrorText: string;
```

C++

```
__property UnicodeString ErrorText;
```

Description

Examine ErrorText to obtain text describing the error.

See Also

GetErrorText (see page 993)

11.2.7.3.2 IAdapterError.Field Property

Returns text describing the error.

Pascal

```
property Field: TComponent;
```

C++

```
__property TComponent * Field;
```

Description

Examine Field to obtain a reference to the field component involved in the error.

See Also

GetField (see page 993)

11.2.7.3.3 IAdapterError.ID Property

Returns error ID.

Pascal

```
property ID: integer;
```

C++

```
__property int ID;
```

Description

Examine ID to obtain the error ID value.

See Also

GetID (see page 993)

ID (see page 5178)

11.2.8 IAdapterErrors Interface

IAdapterErrors is implemented by adapter errors objects.

Class Hierarchy

Pascal

```
IAdapterErrors = interface;
```

C++

```
__interface IAdapterErrors;
```

File

SiteComp

Description

Adapter errors objects keep a list of errors detected while executing an adapter action or generating a page using an adapter. Adapter errors objects may be accessed with server-side script using the adapter's Errors (see page 998) property.

See Also

IAdapterError (see page 992)

TCustomAdapter (see page 5531)

11.2.8.1 IAdapterErrors Members

The following tables list the members exposed by IAdapterErrors.

Public Methods

	Name	Description
	ClearErrors (see page 996)	Clears the errors list.
	DefineLabel (see page 996)	Associates a label with all errors associated with a particular adapter field.
	GetError (see page 996)	Returns a particular error.
	GetErrorCount (see page 997)	Return the number of errors in the errors list.
	GetObjectErrors (see page 997)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 997)	Indicates whether the errors list contains objects associated with a particular adapter field.

Public Properties

	Name	Description
R	ErrorCount (see page 998)	Returns the number of errors in the errors list.
R	Errors (see page 998)	Returns an error from the list.

11.2.8.2 IAdapterErrors Methods

The methods of the IAdapterErrors class are listed here.

Public Methods

	Name	Description
	ClearErrors (see page 996)	Clears the errors list.
	DefineLabel (see page 996)	Associates a label with all errors associated with a particular adapter field.
	GetError (see page 996)	Returns a particular error.
	GetErrorCount (see page 997)	Return the number of errors in the errors list.
	GetObjectErrors (see page 997)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 997)	Indicates whether the errors list contains objects associated with a particular adapter field.

11.2.8.2.1 IAdapterErrors.ClearErrors Method

Clears the errors list.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

Clears the errors list.

11.2.8.2.2 IAdapterErrors.DefineLabel Method

Associates a label with all errors associated with a particular adapter field.

Pascal

```
procedure DefineLabel(const AName: string; const ALabel: string);
```

C++

```
__fastcall DefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

DefineLabel is responsible for replacing an label text in error messages associated with a particular adapter field with the given label. DefineLabel is used when the label used on the Web page is not the same as the label generated as part of the error message.

11.2.8.2.3 IAdapterErrors.GetError Method

Returns a particular error.

Pascal

```
function GetError(I: Integer): IAdapterError;
```

C++

```
__fastcall IAdapterError GetError(int I);
```

Description

I is a zero-based index.

See Also

IAdapterError (see page 992)

11.2.8.2.4 IAdapterErrors.GetErrorCount Method

Return the number of errors in the errors list.

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

Return the number of errors in the errors list.

11.2.8.2.5 IAdapterErrors.GetObjectErrors Method

Returns an object that is used to enumerate all errors associated with an adapter field.

Pascal

```
function GetObjectErrors(const AName: string): TObject;
```

C++

```
__fastcall TObject * GetObjectErrors(const UnicodeString AName);
```

Description

AName identifies an adapter field. nil (Delphi) or NULL (C++) is returned if there are no errors associated with the adapter field.

See Also

HasObjectErrors (see page 997)

11.2.8.2.6 IAdapterErrors.HasObjectErrors Method

Indicates whether the errors list contains objects associated with a particular adapter field.

Pascal

```
function HasObjectErrors(const AName: string): Boolean;
```

C++

```
__fastcall Boolean HasObjectErrors(const UnicodeString AName);
```

Description

HasObjectErrors returns true if any errors are associated with the given adapter field. AName identifies an adapter field.

See Also

GetObjectErrors (see page 997)

11.2.8.3 IAdapterErrors Properties

The properties of the IAdapterErrors class are listed here.

Public Properties

	Name	Description
	ErrorCount (see page 998)	Returns the number of errors in the errors list.

	Errors (see page 998)	Returns an error from the list.

11.2.8.3.1 IAdapterErrors.ErrorCount Property

Returns the number of errors in the errors list.

Pascal

```
property ErrorCount: Integer;
```

C++

```
__property int ErrorCount;
```

Description

ErrorCount returns the result of GetErrorCount (see page 997).

See Also

GetErrorCount (see page 997)

11.2.8.3.2 IAdapterErrors.Errors Property

Returns an error from the list.

Pascal

```
property Errors [I: Integer]: IAdapterError;
```

C++

```
__property IAdapterError Errors[int I];
```

Description

I is a zero-based index. Errors returns the result of GetError (see page 996).

See Also

IAdapterError (see page 992)

GetError (see page 996)

11.2.9 IAdapterFieldAccess Interface

Class Hierarchy

Pascal

```
IAdapterFieldAccess = interface;
```

C++

```
__interface IAdapterFieldAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterFieldAccess.

11.2.9.1 IAdapterFieldAccess Members

The following tables list the members exposed by IAdapterFieldAccess.

Public Methods

	Name	Description
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.

11.2.9.2 IAdapterFieldAccess Methods

The methods of the IAdapterFieldAccess class are listed here.

Public Methods

	Name	Description
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.

11.2.9.2.1 IAdapterFieldAccess.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class IAdapterFieldAccess.

11.2.9.2.2 IAdapterFieldAccess.HasViewAccess Method

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

This is HasViewAccess, a member of class IAdapterFieldAccess.

11.2.10 IAdapterFieldAttributes Interface

Class Hierarchy

SiteComp.IAdapterFieldAttributes

Pascal

```
IAdapterFieldAttributes = interface;
```

C++

```
__interface IAdapterFieldAttributes;
```

File

SiteComp

Description

This is class SiteComp.IAdapterFieldAttributes.

11.2.10.1 IAdapterFieldAttributes Members

The following tables list the members exposed by IAdapterFieldAttributes.

Public Methods

	Name	Description
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.

Public Properties

	Name	Description
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

11.2.10.2 IAdapterFieldAttributes Methods

The methods of the IAdapterFieldAttributes class are listed here.

Public Methods

	Name	Description
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.

11.2.10.2.1 IAdapterFieldAttributes.GetRequired Method

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This is GetRequired, a member of class IAdapterFieldAttributes.

11.2.10.2.2 IAdapterFieldAttributes.GetVisible Method

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

This is GetVisible, a member of class IAdapterFieldAttributes.

11.2.10.3 IAdapterFieldAttributes Properties

The properties of the IAdapterFieldAttributes class are listed here.

Public Properties

	Name	Description
	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

11.2.10.3.1 IAdapterFieldAttributes.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IAdapterFieldAttributes.

11.2.10.3.2 IAdapterFieldAttributes.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IAdapterFieldAttributes.

11.2.11 IAdapterHiddenField Interface

Class Hierarchy

SiteComp.IAdapterHiddenField

Pascal

```
IAdapterHiddenField = interface;
```

C++

```
__interface IAdapterHiddenField;
```

File

SiteComp

Description

This is class SiteComp.IAdapterHiddenField.

11.2.11.1 IAdapterHiddenField Members

The following tables list the members exposed by IAdapterHiddenField.

Public Methods

	Name	Description
	GetName (see page 1002)	This is GetName, a member of class IAdapterHiddenField.
	GetValue (see page 1002)	This is GetValue, a member of class IAdapterHiddenField.

Public Properties

	Name	Description
R	Name (see page 1003)	This is Name, a member of class IAdapterHiddenField.
R	Value (see page 1003)	This is Value, a member of class IAdapterHiddenField.

11.2.11.2 IAdapterHiddenField Methods

The methods of the IAdapterHiddenField class are listed here.

Public Methods

	Name	Description
	GetName (see page 1002)	This is GetName, a member of class IAdapterHiddenField.
	GetValue (see page 1002)	This is GetValue, a member of class IAdapterHiddenField.

11.2.11.2.1 IAdapterHiddenField.GetName Method

Pascal

```
function GetName: string;
```

C++

```
__fastcall UnicodeString GetName();
```

Description

This is GetName, a member of class IAdapterHiddenField.

11.2.11.2.2 IAdapterHiddenField.GetValue Method

Pascal

```
function GetValue: string;
```

C++

```
__fastcall UnicodeString GetValue();
```

Description

This is GetValue, a member of class IAdapterHiddenField.

11.2.11.3 IAdapterHiddenField Properties

The properties of the IAdapterHiddenField class are listed here.

Public Properties

	Name	Description
	Name (see page 1003)	This is Name, a member of class IAdapterHiddenField.
	Value (see page 1003)	This is Value, a member of class IAdapterHiddenField.

11.2.11.3.1 IAdapterHiddenField.Name Property

Pascal

```
property Name: string;
```

C++

```
__property UnicodeString Name;
```

Description

This is Name, a member of class IAdapterHiddenField.

11.2.11.3.2 IAdapterHiddenField.Value Property

Pascal

```
property Value: string;
```

C++

```
__property UnicodeString Value;
```

Description

This is Value, a member of class IAdapterHiddenField.

11.2.12 IAdapterHiddenFields Interface

Class Hierarchy

Pascal

```
IAdapterHiddenFields = interface;
```

C++

```
__interface IAdapterHiddenFields;
```

File

SiteComp

Description

This is class SiteComp.IAdapterHiddenFields.

11.2.12.1 IAdapterHiddenFields Members

The following tables list the members exposed by IAdapterHiddenFields.

Public Methods

	Name	Description
	GetField (see page 1004)	This is GetField, a member of class IAdapterHiddenFields.
	GetFieldCount (see page 1004)	This is GetFieldCount, a member of class IAdapterHiddenFields.

Public Properties

	Name	Description
	FieldCount (see page 1005)	This is FieldCount, a member of class IAdapterHiddenFields.
	Fields (see page 1005)	This is Fields, a member of class IAdapterHiddenFields.

11.2.12.2 IAdapterHiddenFields Methods

The methods of the IAdapterHiddenFields class are listed here.

Public Methods

	Name	Description
	GetField (see page 1004)	This is GetField, a member of class IAdapterHiddenFields.
	GetFieldCount (see page 1004)	This is GetFieldCount, a member of class IAdapterHiddenFields.

11.2.12.2.1 IAdapterHiddenFields.GetField Method

Pascal

```
function GetField(I: Integer): IAdapterHiddenField;
```

C++

```
__fastcall IAdapterHiddenField GetField(int I);
```

Description

This is GetField, a member of class IAdapterHiddenFields.

11.2.12.2.2 IAdapterHiddenFields.GetFieldCount Method

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

This is GetFieldCount, a member of class IAdapterHiddenFields.

11.2.12.3 IAdapterHiddenFields Properties

The properties of the IAdapterHiddenFields class are listed here.

Public Properties

	Name	Description
	FieldCount (see page 1005)	This is FieldCount, a member of class IAdapterHiddenFields.
	Fields (see page 1005)	This is Fields, a member of class IAdapterHiddenFields.

11.2.12.3.1 IAdapterHiddenFields.FieldCount Property

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

This is FieldCount, a member of class IAdapterHiddenFields.

11.2.12.3.2 IAdapterHiddenFields.Fields Property

Pascal

```
property Fields [I: Integer]: IAdapterHiddenField;
```

C++

```
__property IAdapterHiddenField Fields[int I];
```

Description

This is Fields, a member of class IAdapterHiddenFields.

11.2.13 IAdapterItemRequestParams Interface

IAdapterItemRequestParams is the interface for reading the parameters for an adapter field or action request.

Class Hierarchy

SiteComp.IAdapterItemRequestParams

Pascal

```
IAdapterItemRequestParams = interface;
```

C++

```
__interface IAdapterItemRequestParams;
```

File

SiteComp

Description

Use IAdapterItemRequestParams to read the parameters that accompany requests to an adapter field or action. The parameters, which can be accessed through the ParamValues (see page 1009) property, are a set of 'Name=Value' strings. In addition to providing access to the parameters, IAdapterItemRequestParams has two properties, SuccessPage (see page 1009) and FailurePage (see page 1008), which identify the Web pages that should be returned to the caller when the adapter request succeeds or fails.

Note: In C++, method declarations that use IAdapterItemRequestParams use the _di_IAdapterItemRequestParams type instead. This type is a DelphiInterface (see page 3256) wrapper around the IAdapterItemRequestParams interface:

Note: typedef System::DelphiInterface (see page 3256)< IAdapterItemRequestParams > _di_IAdapterItemRequestParams;

See Also

TPageDispatcher (see page 6236)

TCustomWebAppComponents (see page 6201)

TWebAppComponents (see page 6243)

11.2.13.1 IAdapterItemRequestParams Members

The following tables list the members exposed by IAdapterItemRequestParams.

Public Methods

	Name	Description
	GetFailurePage (see page 1006)	Returns the value of the FailurePage (see page 1008) property.
	GetParamValues (see page 1007)	Returns the value of the ParamValues (see page 1009) property.
	GetSuccessPage (see page 1007)	Returns the value of the SuccessPage (see page 1009) property.
	SetFailurePage (see page 1007)	Sets the value of the FailurePage (see page 1008) property.
	SetSuccessPage (see page 1008)	Sets the value of the SuccessPage (see page 1009) property.

Public Properties

	Name	Description
	FailurePage (see page 1008)	Indicates the Web page module that the application should return if the adapter request fails.
R	ParamValues (see page 1009)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 1009)	Indicates the Web page module that the application should return if the adapter request succeeds.

11.2.13.2 IAdapterItemRequestParams Methods

The methods of the IAdapterItemRequestParams class are listed here.

Public Methods

	Name	Description
	GetFailurePage (see page 1006)	Returns the value of the FailurePage (see page 1008) property.
	GetParamValues (see page 1007)	Returns the value of the ParamValues (see page 1009) property.
	GetSuccessPage (see page 1007)	Returns the value of the SuccessPage (see page 1009) property.
	SetFailurePage (see page 1007)	Sets the value of the FailurePage (see page 1008) property.
	SetSuccessPage (see page 1008)	Sets the value of the SuccessPage (see page 1009) property.

11.2.13.2.1 IAdapterItemRequestParams.GetFailurePage Method

Returns the value of the FailurePage (see page 1008) property.

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall UnicodeString GetFailurePage();
```

Description

GetFailurePage is the read implementation of the FailurePage (see page 1008) property.

See Also

FailurePage (see page 1008)

11.2.13.2.2 IAdapterItemRequestParams.GetParamValues Method

Returns the value of the ParamValues (see page 1009) property.

Pascal

```
function GetParamValues: TStrings;
```

C++

```
__fastcall TStrings GetParamValues();
```

Description

GetParamValues is the read implementation of the ParamValues (see page 1009) property.

See Also

ParamValues (see page 1009)

11.2.13.2.3 IAdapterItemRequestParams.GetSuccessPage Method

Returns the value of the SuccessPage (see page 1009) property.

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall UnicodeString GetSuccessPage();
```

Description

GetSuccessPage is the read implementation of the SuccessPage (see page 1009) property.

See Also

SuccessPage (see page 1009)

11.2.13.2.4 IAdapterItemRequestParams.SetFailurePage Method

Sets the value of the FailurePage (see page 1008) property.

Pascal

```
procedure SetFailurePage(const AValue: string);
```

C++

```
__fastcall SetFailurePage(const UnicodeString AValue);
```

Description

SetFailurePage is the write implementation of the FailurePage (see page 1008) property.

AValue is the name of the Web page that should be returned if the adapter request fails.

See Also

FailurePage (see page 1008)

11.2.13.2.5 IAdapterItemRequestParams.SetSuccessPage Method

Sets the value of the SuccessPage (see page 1009) property.

Pascal

```
procedure SetSuccessPage(const AValue: string);
```

C++

```
__fastcall SetSuccessPage(const UnicodeString AValue);
```

Description

SetSuccessPage is the write implementation of the SuccessPage (see page 1009) property.

AValue is the name of the Web page that should be returned when the adapter request succeeds.

See Also

SuccessPage (see page 1009)

11.2.13.3 IAdapterItemRequestParams Properties

The properties of the IAdapterItemRequestParams class are listed here.

Public Properties

	Name	Description
	FailurePage (see page 1008)	Indicates the Web page module that the application should return if the adapter request fails.
R	ParamValues (see page 1009)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 1009)	Indicates the Web page module that the application should return if the adapter request succeeds.

11.2.13.3.1 IAdapterItemRequestParams.FailurePage Property

Indicates the Web page module that the application should return if the adapter request fails.

Pascal

```
property FailurePage: string;
```

C++

```
__property UnicodeString FailurePage;
```

Description

FailurePage is the name of the registered Web page module that should generate the content of the response message if the request to the adapter fails.

See Also

SuccessPage (see page 1009)

11.2.13.3.2 IAdapterItemRequestParams.ParamValues Property

Lists the parameter values that are included in requests to the adapter action or field.

Pascal

```
property ParamValues: TStrings;
```

C++

```
__property TStrings ParamValues;
```

Description

Use ParamValues to access the list of parameter values. Use the Names property of ParamValues to obtain the names of the parameters and the Values property to access the corresponding values.

See Also

Names

Values

11.2.13.3.3 IAdapterItemRequestParams.SuccessPage Property

Indicates the Web page module that the application should return if the adapter request succeeds.

Pascal

```
property SuccessPage: string;
```

C++

```
__property UnicodeString SuccessPage;
```

Description

SuccessPage is the name of the registered Web page module that should generate the content of the response message when the request to the adapter succeeds.

11.2.14 IAdapterMode Interface

Class Hierarchy

Pascal

```
IAdapterMode = interface;
```

C++

```
__interface IAdapterMode;
```

File

SiteComp

Description

This is class SiteComp.IAdapterMode.

11.2.14.1 IAdapterMode Members

The following tables list the members exposed by IAdapterMode.

Public Methods

	Name	Description
	GetAdapterMode (see page 1010)	This is GetAdapterMode, a member of class IAdapterMode.
	GetNeedAdapterMode (see page 1010)	This is GetNeedAdapterMode, a member of class IAdapterMode.
	RestoreDefaultAdapterMode (see page 1011)	This is RestoreDefaultAdapterMode, a member of class IAdapterMode.
	SetAdapterMode (see page 1011)	This is SetAdapterMode, a member of class IAdapterMode.

Public Properties

	Name	Description
	AdapterMode (see page 1011)	This is AdapterMode, a member of class IAdapterMode.
R	NeedAdapterMode (see page 1011)	This is NeedAdapterMode, a member of class IAdapterMode.

11.2.14.2 IAdapterMode Methods

The methods of the IAdapterMode class are listed here.

Public Methods

	Name	Description
	GetAdapterMode (see page 1010)	This is GetAdapterMode, a member of class IAdapterMode.
	GetNeedAdapterMode (see page 1010)	This is GetNeedAdapterMode, a member of class IAdapterMode.
	RestoreDefaultAdapterMode (see page 1011)	This is RestoreDefaultAdapterMode, a member of class IAdapterMode.
	SetAdapterMode (see page 1011)	This is SetAdapterMode, a member of class IAdapterMode.

11.2.14.2.1 IAdapterMode.GetAdapterMode Method

Pascal

```
function GetAdapterMode: string;
```

C++

```
__fastcall UnicodeString GetAdapterMode();
```

Description

This is GetAdapterMode, a member of class IAdapterMode.

11.2.14.2.2 IAdapterMode.GetNeedAdapterMode Method

Pascal

```
function GetNeedAdapterMode: Boolean;
```

C++

```
__fastcall Boolean GetNeedAdapterMode();
```

Description

This is GetNeedAdapterMode, a member of class IAdapterMode.

11.2.14.2.3 IAdapterMode.RestoreDefaultAdapterMode Method

Pascal

```
procedure RestoreDefaultAdapterMode;
```

C++

```
__fastcall RestoreDefaultAdapterMode();
```

Description

This is RestoreDefaultAdapterMode, a member of class IAdapterMode.

11.2.14.2.4 IAdapterMode.SetAdapterMode Method

Pascal

```
procedure SetAdapterMode(const AValue: string);
```

C++

```
__fastcall SetAdapterMode(const UnicodeString AValue);
```

Description

This is SetAdapterMode, a member of class IAdapterMode.

11.2.14.3 IAdapterMode Properties

The properties of the IAdapterMode class are listed here.

Public Properties

	Name	Description
	AdapterMode (see page 1011)	This is AdapterMode, a member of class IAdapterMode.
R	NeedAdapterMode (see page 1011)	This is NeedAdapterMode, a member of class IAdapterMode.

11.2.14.3.1 IAdapterMode.AdapterMode Property

Pascal

```
property AdapterMode: string;
```

C++

```
__property UnicodeString AdapterMode;
```

Description

This is AdapterMode, a member of class IAdapterMode.

11.2.14.3.2 IAdapterMode.NeedAdapterMode Property

Pascal

```
property NeedAdapterMode: Boolean;
```

C++

```
__property Boolean NeedAdapterMode;
```

Description

This is NeedAdapterMode, a member of class IAdapterMode.

11.2.15 IAdapterRequestHandler Interface

IAdapterRequestHandler handles requests to execute an adapter action or retrieve the value of an image field.

Class Hierarchy

Pascal

```
IAdapterRequestHandler = interface;
```

C++

```
__interface IAdapterRequestHandler;
```

File

SiteComp

Description

IAdapterRequestHandler is implemented by classes that execute an adapter action or look up the value of an image field.

See Also

TBaseAdapterAction (see page 5447)

TCustomAdapterImageField (see page 5623)

11.2.15.1 IAdapterRequestHandler Members

The following tables list the members exposed by IAdapterRequestHandler.

Public Methods

	Name	Description
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.

11.2.15.2 IAdapterRequestHandler Methods

The methods of the IAdapterRequestHandler class are listed here.

Public Methods

	Name	Description
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.

11.2.15.2.1 IAdapterRequestHandler.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext creates a new request context based on the specified parameters.

See Also

AdapterRequest (see page 5971)

TAdapterDispatcher (see page 6148)

CreateRequestContext (see page 5452)

CreateRequestContext (see page 5628)

11.2.15.2.2 IAdapterRequestHandler.HandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to execute the adapter action and generate a response.

See Also

HandleRequest (see page 5463)

HandleRequest (see page 5630)

11.2.16 IAsFormatted Interface

Class Hierarchy

Pascal

```
IAsFormatted = interface;
```

C++

```
__interface IAsFormatted;
```

File

SiteComp

Description

This is class SiteComp.IAsFormatted.

11.2.16.1 IAsFormatted Members

The following tables list the members exposed by IAsFormatted.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.

11.2.16.2 IAsFormatted Methods

The methods of the IAsFormatted class are listed here.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.

11.2.16.2.1 IAsFormatted.AsFormatted Method

Pascal

```
function AsFormatted: string;
```

C++

```
__fastcall UnicodeString AsFormatted();
```

Description

This is AsFormatted, a member of class IAsFormatted.

11.2.17 IDefaultPageFileName Interface

Class Hierarchy

Pascal

```
IDefaultPageFileName = interface;
```

C++

```
__interface IDefaultPageFileName;
```

File

SiteComp

Description

This is class SiteComp.IDefaultPageFileName.

11.2.17.1 IDefaultPageFileName Members

The following tables list the members exposed by IDefaultPageFileName.

Public Methods

	Name	Description
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

11.2.17.2 IDefaultPageFileName Methods

The methods of the IDefaultPageFileName class are listed here.

Public Methods

	Name	Description
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

11.2.17.2.1 IDefaultPageFileName.SetDefaultPageFileName Method

Pascal

```
procedure SetDefaultPageFileName(const APageFile: string);
```

C++

```
__fastcall SetDefaultPageFileName(const UnicodeString APageFile);
```

Description

This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

11.2.18 IFieldValuesAdapter Interface

Class Hierarchy

SiteComp.IFieldValuesAdapter

Pascal

```
IFieldValuesAdapter = interface;
```

C++

```
__interface IFieldValuesAdapter;
```

File

SiteComp

Description

This is class SiteComp.IFieldValuesAdapter.

11.2.18.1 IFieldValuesAdapter Members

The following tables list the members exposed by IFieldValuesAdapter.

Public Methods

	Name	Description
	GetField (see page 1016)	This is GetField, a member of class IFieldValuesAdapter.
	GetValueIndex (see page 1016)	This is GetValueIndex, a member of class IFieldValuesAdapter.

11.2.18.2 IFieldValuesAdapter Methods

The methods of the IFieldValuesAdapter class are listed here.

Public Methods

	Name	Description
	GetField (see page 1016)	This is GetField, a member of class IFieldValuesAdapter.
	GetValueIndex (see page 1016)	This is GetValueIndex, a member of class IFieldValuesAdapter.

11.2.18.2.1 IFieldValuesAdapter.GetField Method

Pascal

```
function GetField: TObject;
```

C++

```
__fastcall TObject * GetField();
```

Description

This is GetField, a member of class IFieldValuesAdapter.

11.2.18.2.2 IFieldValuesAdapter.GetValueIndex Method

Pascal

```
function GetValueIndex: Integer;
```

C++

```
__fastcall int GetValueIndex();
```

Description

This is GetValueIndex, a member of class IFieldValuesAdapter.

11.2.19 IFindIncludeFile Interface

Class Hierarchy

SiteComp.IFindIncludeFile

Pascal

```
IFindIncludeFile = interface;
```

C++

```
__interface IFindIncludeFile;
```

File

SiteComp

Description

This is class SiteComp.IFindIncludeFile.

11.2.19.1 IFindIncludeFile Members

The following tables list the members exposed by IFindIncludeFile.

Public Methods

	Name	Description
	FindIncludeFile (see page 1017)	This is FindIncludeFile, a member of class IFindIncludeFile.

11.2.19.2 IFindIncludeFile Methods

The methods of the IFindIncludeFile class are listed here.

Public Methods

	Name	Description
	FindIncludeFile (see page 1017)	This is FindIncludeFile, a member of class IFindIncludeFile.

11.2.19.2.1 IFindIncludeFile.FindIncludeFile Method

Pascal

```
function FindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean;
```

C++

```
__fastcall Boolean FindIncludeFile(TComponent * AComponent, const UnicodeString AFileName,
UnicodeString AResult);
```

Description

This is FindIncludeFile, a member of class IFindIncludeFile.

11.2.20 IGetAdapterActions Interface

Class Hierarchy

SiteComp.IGetAdapterActions

Pascal

```
IGetAdapterActions = interface;
```

C++

```
__interface IGetAdapterActions;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterActions.

11.2.20.1 IGetAdapterActions Members

The following tables list the members exposed by IGetAdapterActions.

Public Methods

	Name	Description
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.

11.2.20.2 IGetAdapterActions Methods

The methods of the IGetAdapterActions class are listed here.

Public Methods

	Name	Description
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.

11.2.20.2.1 IGetAdapterActions.GetAdapterActions Method

Pascal

```
function GetAdapterActions: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterActions();
```

Description

This is GetAdapterActions, a member of class IGetAdapterActions.

11.2.21 IGetAdapterDisplayCharacteristics Interface

Class Hierarchy

SiteComp.IGetAdapterDisplayCharacteristics

Pascal

```
IGetAdapterDisplayCharacteristics = interface;
```

C++

```
__interface IGetAdapterDisplayCharacteristics;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterDisplayCharacteristics.

11.2.21.1 IGetAdapterDisplayCharacteristics Members

The following tables list the members exposed by IGetAdapterDisplayCharacteristics.

Public Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

11.2.21.2 IGetAdapterDisplayCharacteristics Methods

The methods of the IGetAdapterDisplayCharacteristics class are listed here.

Public Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

11.2.21.2.1 IGetAdapterDisplayCharacteristics.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

11.2.22 IGetAdapterErrors Interface

Class Hierarchy

SiteComp.IGetAdapterErrors

Pascal

```
IGetAdapterErrors = interface;
```

C++

```
__interface IGetAdapterErrors;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterErrors.

11.2.22.1 IGetAdapterErrors Members

The following tables list the members exposed by IGetAdapterErrors.

Public Methods

	Name	Description
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.

11.2.22.2 IGetAdapterErrors Methods

The methods of the IGetAdapterErrors class are listed here.

Public Methods

	Name	Description
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.

11.2.22.2.1 IGetAdapterErrors.GetAdapterErrors Method

Pascal

```
function GetAdapterErrors: TObject;
```

C++

```
__fastcall TObject * GetAdapterErrors();
```

Description

This is GetAdapterErrors, a member of class IGetAdapterErrors.

11.2.23 IGetAdapterFields Interface

Class Hierarchy

Pascal

```
IGetAdapterFields = interface;
```

C++

```
__interface IGetAdapterFields;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterFields.

11.2.23.1 IGetAdapterFields Members

The following tables list the members exposed by IGetAdapterFields.

Public Methods

	Name	Description
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.

11.2.23.2 IGetAdapterFields Methods

The methods of the IGetAdapterFields class are listed here.

Public Methods

	Name	Description
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.

11.2.23.2.1 IGetAdapterFields.GetAdapterFields Method

Pascal

```
function GetAdapterFields: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterFields();
```

Description

This is GetAdapterFields, a member of class IGetAdapterFields.

11.2.24 IGetAdapterHiddenFields Interface

Class Hierarchy

SiteComp.IGetAdapterHiddenFields

Pascal

```
IGetAdapterHiddenFields = interface;
```

C++

```
__interface IGetAdapterHiddenFields;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterHiddenFields.

11.2.24.1 IGetAdapterHiddenFields Members

The following tables list the members exposed by IGetAdapterHiddenFields.

Public Methods

	Name	Description
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

11.2.24.2 IGetAdapterHiddenFields Methods

The methods of the IGetAdapterHiddenFields class are listed here.

Public Methods

	Name	Description
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

11.2.24.2.1 IGetAdapterHiddenFields.GetAdapterHiddenFields Method

Pascal

```
function GetAdapterHiddenFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenFields();
```

Description

This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.

11.2.24.2.2 IGetAdapterHiddenFields.GetAdapterHiddenRecordFields Method

Pascal

```
function GetAdapterHiddenRecordFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenRecordFields();
```

Description

This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

11.2.25 IGetAdapterImage Interface

Class Hierarchy

Pascal

```
IGetAdapterImage = interface;
```

C++

```
__interface IGetAdapterImage;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterImage.

11.2.25.1 IGetAdapterImage Members

The following tables list the members exposed by IGetAdapterImage.

Public Methods

	Name	Description
	GetAdapterImage (see page 1023)	This is GetAdapterImage, a member of class IGetAdapterImage.

11.2.25.2 IGetAdapterImage Methods

The methods of the IGetAdapterImage class are listed here.

Public Methods

	Name	Description
	GetAdapterImage (see page 1023)	This is GetAdapterImage, a member of class IGetAdapterImage.

11.2.25.2.1 IGetAdapterImage.GetAdapterImage Method

Pascal

```
function GetAdapterImage: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterImage();
```

Description

This is GetAdapterImage, a member of class IGetAdapterImage.

11.2.26 IGetAdapterItemRequestParams Interface

Class Hierarchy

SiteComp.IGetAdapterItemRequestParams

Pascal

```
IGetAdapterItemRequestParams = interface;
```

C++

```
__interface IGetAdapterItemRequestParams;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterItemRequestParams.

11.2.26.1 IGetAdapterItemRequestParams Members

The following tables list the members exposed by IGetAdapterItemRequestParams.

Public Methods

	Name	Description
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

11.2.26.2 IGetAdapterItemRequestParams Methods

The methods of the IGetAdapterItemRequestParams class are listed here.

Public Methods

	Name	Description
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

11.2.26.2.1 IGetAdapterItemRequestParams.GetAdapterItemRequestParams Method

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(UnicodeString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

11.2.27 IGetAdapterRequestDefaultResponse Interface

Class Hierarchy

SiteComp.IGetAdapterRequestDefaultResponse

Pascal

```
IGetAdapterRequestDefaultResponse = interface;
```

C++

```
__interface IGetAdapterRequestDefaultResponse;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterRequestDefaultResponse.

11.2.27.1 IGetAdapterRequestDefaultResponse Members

The following tables list the members exposed by IGetAdapterRequestDefaultResponse.

Public Methods

	Name	Description
	GetFailurePage (see page 1025)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetSuccessPage (see page 1025)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

Public Properties

	Name	Description
R	FailurePage (see page 1026)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	SuccessPage (see page 1026)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.2 IGetAdapterRequestDefaultResponse Methods

The methods of the IGetAdapterRequestDefaultResponse class are listed here.

Public Methods

	Name	Description
	GetFailurePage (see page 1025)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetSuccessPage (see page 1025)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.2.1 IGetAdapterRequestDefaultResponse.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall UnicodeString GetFailurePage();
```

Description

This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.2.2 IGetAdapterRequestDefaultResponse.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall UnicodeString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.3 IGetAdapterRequestDefaultResponse Properties

The properties of the IGetAdapterRequestDefaultResponse class are listed here.

Public Properties

	Name	Description
	FailurePage (see page 1026)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
	SuccessPage (see page 1026)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.3.1 IGetAdapterRequestDefaultResponse.FailurePage Property

Pascal

```
property FailurePage: string;
```

C++

```
__property UnicodeString FailurePage;
```

Description

This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.

11.2.27.3.2 IGetAdapterRequestDefaultResponse.SuccessPage Property

Pascal

```
property SuccessPage: string;
```

C++

```
__property UnicodeString SuccessPage;
```

Description

This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

11.2.28 IGetAdapterValuesList Interface

Class Hierarchy

SiteComp.IGetAdapterValuesList

Pascal

```
IGetAdapterValuesList = interface;
```

C++

```
__interface IGetAdapterValuesList;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterValuesList.

11.2.28.1 IGetAdapterValuesList Members

The following tables list the members exposed by IGetAdapterValuesList.

Public Methods

	Name	Description
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

11.2.28.2 IGetAdapterValuesList Methods

The methods of the IGetAdapterValuesList class are listed here.

Public Methods

	Name	Description
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

11.2.28.2.1 IGetAdapterValuesList.GetAdapterValuesList Method

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

11.2.29 IGetDefaultAction Interface

Class Hierarchy

SiteComp.IGetDefaultAction

Pascal

```
IGetDefaultAction = interface;
```

C++

```
__interface IGetDefaultAction;
```

File

SiteComp

Description

This is class SiteComp.IGetDefaultAction.

11.2.29.1 IGetDefaultAction Members

The following tables list the members exposed by IGetDefaultAction.

Public Methods

	Name	Description
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.

Public Properties

	Name	Description
	DefaultAction (see page 1028)	This is DefaultAction, a member of class IGetDefaultAction.

11.2.29.2 IGetDefaultAction Methods

The methods of the IGetDefaultAction class are listed here.

Public Methods

	Name	Description
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.

11.2.29.2.1 IGetDefaultAction.GetDefaultAction Method

Pascal

```
function GetDefaultAction: TComponent;
```

C++

```
__fastcall TComponent * GetDefaultAction();
```

Description

This is GetDefaultAction, a member of class IGetDefaultAction.

11.2.29.3 IGetDefaultAction Properties

The properties of the IGetDefaultAction class are listed here.

Public Properties

	Name	Description
	DefaultAction (see page 1028)	This is DefaultAction, a member of class IGetDefaultAction.

11.2.29.3.1 IGetDefaultAction.DefaultAction Property

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TComponent * DefaultAction;
```

Description

This is DefaultAction, a member of class IGetDefaultAction.

11.2.30 IGetDesigntimeWarnings Interface

Class Hierarchy

Pascal

```
IGetDesigntimeWarnings = interface;
```

C++

```
__interface IGetDesigntimeWarnings;
```

File

SiteComp

Description

This is class SiteComp.IGetDesigntimeWarnings.

11.2.30.1 IGetDesigntimeWarnings Members

The following tables list the members exposed by IGetDesigntimeWarnings.

Public Methods

	Name	Description
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

11.2.30.2 IGetDesigntimeWarnings Methods

The methods of the IGetDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

11.2.30.2.1 IGetDesigntimeWarnings.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the dataset values list an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DataSet property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. If DataSet is set, but the dataset is not active, GetDesigntimeWarnings adds a message that indicates this problem. Finally, if the ValueField property is not set, GetDesigntimeWarnings adds a message indicating this omission.

ValueField

11.2.31 IGetFieldValuesAdapter Interface

Class Hierarchy

SiteComp.IGetFieldValuesAdapter

Pascal

```
IGetFieldValuesAdapter = interface;
```

C++

```
__interface IGetFieldValuesAdapter;
```

File

SiteComp

Description

This is class SiteComp.IGetFieldValuesAdapter.

11.2.31.1 IGetFieldValuesAdapter Members

The following tables list the members exposed by IGetFieldValuesAdapter.

Public Methods

	Name	Description
	GetFieldValuesAdapter (see page 1031)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

11.2.31.2 IGetFieldValuesAdapter Methods

The methods of the IGetFieldValuesAdapter class are listed here.

Public Methods

	Name	Description
	GetFieldValuesAdapter (see page 1031)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

11.2.31.2.1 IGetFieldValuesAdapter.GetFieldValuesAdapter Method

Pascal

```
function GetFieldValuesAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetFieldValuesAdapter();
```

Description

This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

11.2.32 IGetHTMLStyle Interface

IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.

Class Hierarchy

Pascal

```
IGetHTMLStyle = interface;
```

C++

```
__interface IGetHTMLStyle;
```

File

SiteComp

Description

IGetHTMLStyle methods are typically called while generating HTML to display adapter fields and adapter actions. An adapter field implements this interface to indicate, for example, whether it's value should be displayed with an HTML input field or a select list. An adapter action implements this interface to indicate, for example, whether it's value should be displayed with an HTML button or hyperlink.

TAdapterPageProducer child components may call this interface when generating HTML. For example, TCustomAdapterDisplayField calls GetViewMode (see page 1033) when the TCustomAdapterDisplayField's ViewMode property is set to vmDefault. TCustomAdapterActionButton calls GetDisplayStyle (see page 1032) when its DisplayType property is ctDefault.

See Also

TAdapterNamedDisplayField (see page 5343)

TCustomAdapterDisplayColumn (see page 6461)

TCustomAdapterDisplayField (see page 6467)

11.2.32.1 IGetHTMLStyle Members

The following tables list the members exposed by IGetHTMLStyle.

Public Methods

	Name	Description
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.

11.2.32.2 IGetHTMLStyle Methods

The methods of the IGetHTMLStyle class are listed here.

Public Methods

	Name	Description
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.

11.2.32.2.1 IGetHTMLStyle.GetDisplayStyle Method

Returns the preferred display style for an adapter field or adapter action.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetDisplayStyle(const UnicodeString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Edit).

Adapter fields typically return one of the following values:

Value	Meaning
Text	Display the field as read-only text
Image	Display the field as an image
List	Display the field as a list of read only values
Button	Display the adapter action as a button
Image	Display the adapter action as an image
Anchor	Display the adapter action as a hyperlink
EventImages	Display the adapter action as an image with events that change the image as the mouse is moved.

Adapter actions typically return one of the following values:

Value	Meaning
Button	Display the adapter action as a button
Image	Display the adapter action as an image
Anchor	Display the adapter action as a hyperlink
EventImages	Display the adapter action as an image with events that change the image as the mouse is moved.

User the server-side script DisplayStyle property to get these values from adapter fields and adapter actions.

See Also

DisplayType (see page 6473)

DisplayType (see page 6439)

11.2.32.2.2 IGetHTMLStyle.GetInputStyle Method

Returns the preferred editing style for an adapter field.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetInputStyle(const UnicodeString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Browse).

Adapter fields typically return one of the following values:

Value	Meaning
TextInput	Edit the adapter field using a single line input field.
PasswordInput	Edit the adapter field as a password field.
Select	Edit the adapter field using a single selection list.
SelectMultiple	Edit the adapter field using a multiple selection list.
Radio	Edit the adapter field using radio buttons.
CheckBox	Edit the adapter field using check boxes.
TextArea	Edit the adapter field using a multi-line input field.
File	Edit the adapter field using a file upload input field.

Use the server-side script InputStyle property to get these values from adapter fields.

See Also

InputType (see page 6474)

11.2.32.2.3 IGetHTMLStyle.GetViewMode Method

Returns the preferred mode of an adapter field.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetViewMode(const UnicodeString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Insert (see page 3601)).

Adapter fields typically return one of the following values:

Value	Meaning
Input (see page 3827)	Display the adapter field as an input field, by default use the style returned by the GetInputStyle (see page 1033) method.
Display	Display the adapter field as a read-only field, by default use the style returned by GetDisplayStyle (see page 1032).
ToggleOnAccess	Display as an input field in the end-user has modify rights, otherwise displays as a read-only field.

Use the server-side script ViewMode property to get these values from adapter fields.

See Also

ViewMode (see page 6475)

11.2.33 IGetProducerComponent Interface

Class Hierarchy

SiteComp.IGetProducerComponent

Pascal

```
IGetProducerComponent = interface;
```

C++

```
__interface IGetProducerComponent;
```

File

SiteComp

Description

This is class SiteComp.IGetProducerComponent.

11.2.33.1 IGetProducerComponent Members

The following tables list the members exposed by IGetProducerComponent.

Public Methods

	Name	Description
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.

11.2.33.2 IGetProducerComponent Methods

The methods of the IGetProducerComponent class are listed here.

Public Methods

	Name	Description
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.

11.2.33.2.1 IGetProducerComponent.GetProducerComponent Method

Pascal

```
function GetProducerComponent: TComponent;
```

C++

```
__fastcall TComponent * GetProducerComponent();
```

Description

This is GetProducerComponent, a member of class IGetProducerComponent.

11.2.34 IGetScriptObject Interface

Class Hierarchy

SiteComp.IGetScriptObject

Pascal

```
IGetScriptObject = interface;
```

C++

```
__interface IGetScriptObject;
```

File

SiteComp

Description

This is class SiteComp.IGetScriptObject.

11.2.34.1 IGetScriptObject Members

The following tables list the members exposed by IGetScriptObject.

Public Methods

	Name	Description
	GetScriptObject (see page 1036)	This is GetScriptObject, a member of class IGetScriptObject.

11.2.34.2 IGetScriptObject Methods

The methods of the IGetScriptObject class are listed here.

Public Methods

	Name	Description
	GetScriptObject (see page 1036)	This is GetScriptObject, a member of class IGetScriptObject.

11.2.34.2.1 IGetScriptObject.GetScriptObject Method

Pascal

```
function GetScriptObject: IInterface; deprecated;
```

C++

```
__fastcall IInterface GetScriptObject();
```

Description

This is GetScriptObject, a member of class IGetScriptObject.

11.2.35 IGetScriptObjectClassKey Interface

Class Hierarchy

Pascal

```
IGetScriptObjectClassKey = interface;
```

C++

```
__interface IGetScriptObjectClassKey;
```

File

SiteComp

Description

This is class SiteComp.IGetScriptObjectClassKey.

11.2.35.1 IGetScriptObjectClassKey Members

The following tables list the members exposed by IGetScriptObjectClassKey.

Public Methods

	Name	Description
	GetScriptObjectClassKey (see page 1037)	This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

11.2.35.2 IGetScriptObjectClassKey Methods

The methods of the IGetScriptObjectClassKey class are listed here.

Public Methods

	Name	Description
	GetScriptObjectClassKey (see page 1037)	This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

11.2.35.2.1 IGetScriptObjectClassKey.GetScriptObjectClassKey Method

Pascal

```
function GetScriptObjectClassKey: TClass; deprecated;
```

C++

```
__fastcall TClass GetScriptObjectClassKey();
```

Description

This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

11.2.36 IGetWebAppComponents Interface

Class Hierarchy

Pascal

```
IGetWebAppComponents = interface;
```

C++

```
__interface IGetWebAppComponents;
```

File

SiteComp

Description

This is class SiteComp.IGetWebAppComponents.

11.2.36.1 IGetWebAppComponents Members

The following tables list the members exposed by IGetWebAppComponents.

Public Methods

	Name	Description
	GetAdapterDispatcher (see page 1038)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetLocateFileService (see page 1038)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetPageDispatcher (see page 1038)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetWebApplicationInfo (see page 1038)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 1039)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 1039)	This is GetWebUserList, a member of class IGetWebAppComponents.

Public Properties

	Name	Description
R	WebApplicationInfo (see page 1039)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
R	WebEndUser (see page 1040)	This is WebEndUser, a member of class IGetWebAppComponents.

11.2.36.2 IGetWebAppComponents Methods

The methods of the IGetWebAppComponents class are listed here.

Public Methods

	Name	Description
	GetAdapterDispatcher (see page 1038)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetLocateFileService (see page 1038)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetPageDispatcher (see page 1038)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetWebApplicationInfo (see page 1038)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 1039)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 1039)	This is GetWebUserList, a member of class IGetWebAppComponents.

11.2.36.2.1 IGetWebAppComponents.GetAdapterDispatcher Method

Pascal

```
function GetAdapterDispatcher: IAdapterDispatcher;
```

C++

```
__fastcall IAdapterDispatcher GetAdapterDispatcher();
```

Description

This is GetAdapterDispatcher, a member of class IGetWebAppComponents.

11.2.36.2.2 IGetWebAppComponents.GetLocateFileService Method

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

This is GetLocateFileService, a member of class IGetWebAppComponents.

11.2.36.2.3 IGetWebAppComponents.GetPageDispatcher Method

Pascal

```
function GetPageDispatcher: IPageDispatcher;
```

C++

```
__fastcall IPageDispatcher GetPageDispatcher();
```

Description

This is GetPageDispatcher, a member of class IGetWebAppComponents.

11.2.36.2.4 IGetWebAppComponents.GetWebApplicationInfo Method

Pascal

```
function GetWebApplicationInfo: IWebApplicationInfo;
```

C++

```
__fastcall IWebApplicationInfo GetWebApplicationInfo();
```

Description

This is GetWebApplicationInfo, a member of class IGetWebAppComponents.

11.2.36.2.5 IGetWebAppComponents.GetWebEndUser Method

Pascal

```
function GetWebEndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser GetWebEndUser();
```

Description

This is GetWebEndUser, a member of class IGetWebAppComponents.

11.2.36.2.6 IGetWebAppComponents.GetWebUserList Method

Pascal

```
function GetWebUserList: IWebUserList;
```

C++

```
__fastcall IWebUserList GetWebUserList();
```

Description

This is GetWebUserList, a member of class IGetWebAppComponents.

11.2.36.3 IGetWebAppComponents Properties

The properties of the IGetWebAppComponents class are listed here.

Public Properties

	Name	Description
	WebApplicationInfo (see page 1039)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
	WebEndUser (see page 1040)	This is WebEndUser, a member of class IGetWebAppComponents.

11.2.36.3.1 IGetWebAppComponents.WebApplicationInfo Property

Pascal

```
property WebApplicationInfo: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo WebApplicationInfo;
```

Description

This is WebApplicationInfo, a member of class IGetWebAppComponents.

11.2.36.3.2 IGetWebAppComponents.WebEndUser Property

Pascal

```
property WebEndUser: IWebEndUser;
```

C++

```
__property IWebEndUser WebEndUser;
```

Description

This is WebEndUser, a member of class IGetWebAppComponents.

11.2.37 IIDEFileManager Interface

Class Hierarchy

SiteComp.IIDEFileManager

Pascal

```
IIDEFileManager = interface;
```

C++

```
__interface IIDEFileManager;
```

File

SiteComp

Description

This is class SiteComp.IIDEFileManager.

11.2.37.1 IIDEFileManager Members

The following tables list the members exposed by IIDEFileManager.

Public Methods

	Name	Description
	SearchFile (see page 1041)	This is SearchFile, a member of class IIDEFileManager.

11.2.37.2 IIDEFileManager Methods

The methods of the IIDEFileManager class are listed here.

Public Methods

	Name	Description
	SearchFile (see page 1041)	This is SearchFile, a member of class IIDEFileManager.

11.2.37.2.1 IIDEFileManager.SearchFile Method

Pascal

```
function SearchFile(const AFileName: string): string;
```

C++

```
__fastcall UnicodeString SearchFile(const UnicodeString AFileName);
```

Description

This is SearchFile, a member of class IIDEFileManager.

11.2.38 IImageProducer Interface

IImageProducer is the interface for accessing the image that an adapter component supplies.

Class Hierarchy

Pascal

```
IImageProducer = interface;
```

C++

```
__interface IImageProducer;
```

File

SiteComp

Description

IImageProducer is the interface used to access the object that supplies an image to server-side script in a WebSnap application. It defines a single method, GetAdapterImage (see page 1042), which returns the interface of the object that is responsible for providing the image. That object may generate the image, or it may simply generate an HREF that addresses the object that generates the image.

Note that IImageProducer introduces an extra level of indirection when fetching images. IImageProducer is not necessarily the interface of the object that provides the image, it merely retrieves that interface. The reason for this indirection is because the object that implements IImageProducer may work with multiple adapter fields that produce a variety of images, depending on the supplied caption.

Note: In C++, method declarations that use IImageProducer use the _di_IImageProducer type instead. This type is a DelphiInterface (see page 3256) wrapper around the IImageProducer interface:

Note: typedef System::DelphiInterface (see page 3256)< IImageProducer > _di_IImageProducer;

See Also

IActionImageProducer (see page 978)

TDataSetAdapterImageField

TAdapterImageField (see page 5308)

11.2.38.1 IImageProducer Members

The following tables list the members exposed by IImageProducer.

Public Methods

	Name	Description
	GetAdapterImage (see page 1042)	Returns the object that is responsible for providing a specified image.

11.2.38.2 IImageProducer Methods

The methods of the IImageProducer class are listed here.

Public Methods

	Name	Description
	GetAdapterImage (see page 1042)	Returns the object that is responsible for providing a specified image.

11.2.38.2.1 IImageProducer.GetAdapterImage Method

Returns the object that is responsible for providing a specified image.

Pascal

```
function GetAdapterImage(const AComponentName: string; const ACaption: WideString): TObject;
```

C++

```
__fastcall TObject * GetAdapterImage(const UnicodeString AComponentName, const BSTR ACaption);
```

Description

GetAdapterImage returns the object that supplies an HREF for the specified image. That object can supply the HREF in one of two ways:

It can implement the IWebImageHREF (see page 1097) interface.

It can be the object that produces the image in response to request messages. In this case, the adapter dispatcher's EncodeAdapterItemRequestAsHREF method generates the HREF to address this object.

AComponentName is the name of the component that is requesting the image. GetAdapterImage can use this parameter to determine which of several objects is appropriate for supplying the image.

ACaption is a text label that describes the desired image. GetAdapterImage can use this parameter to determine which of several objects is appropriate for supplying the image.

IWebImageHREF (see page 1097)

EncodeAdapterItemRequestAsHREF (see page 6173)

11.2.39 IInternetEnvOptions Interface

Class Hierarchy

SiteComp.IInternetEnvOptions

Pascal

```
IInternetEnvOptions = interface;
```

C++

```
__interface IInternetEnvOptions;
```

File

SiteComp

Description

This is class SiteComp.IInternetEnvOptions.

11.2.39.1 IInternetEnvOptions Members

The following tables list the members exposed by IInternetEnvOptions.

Public Methods

	Name	Description
	GetDisableDebugging (see page 1043)	This is GetDisableDebugging, a member of class IInternetEnvOptions.
	GetHTMLExt (see page 1044)	This is GetHTMLExt, a member of class IInternetEnvOptions.
	GetSampleImageFile (see page 1044)	This is GetSampleImageFile, a member of class IInternetEnvOptions.
	GetScriptTimeoutSecs (see page 1044)	This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

Public Properties

	Name	Description
R	DisableDebugger (see page 1044)	This is DisableDebugger, a member of class IInternetEnvOptions.
R	HTMLExt (see page 1045)	This is HTMLExt, a member of class IInternetEnvOptions.
R	SampleImageFile (see page 1045)	This is SampleImageFile, a member of class IInternetEnvOptions.
R	ScriptTimeoutSecs (see page 1045)	This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

11.2.39.2 IInternetEnvOptions Methods

The methods of the IInternetEnvOptions class are listed here.

Public Methods

	Name	Description
	GetDisableDebugging (see page 1043)	This is GetDisableDebugging, a member of class IInternetEnvOptions.
	GetHTMLExt (see page 1044)	This is GetHTMLExt, a member of class IInternetEnvOptions.
	GetSampleImageFile (see page 1044)	This is GetSampleImageFile, a member of class IInternetEnvOptions.
	GetScriptTimeoutSecs (see page 1044)	This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

11.2.39.2.1 IInternetEnvOptions.GetDisableDebugging Method

Pascal

```
function GetDisableDebugging: Boolean;
```

C++

```
__fastcall Boolean GetDisableDebugging();
```

Description

This is GetDisableDebugging, a member of class IInternetEnvOptions.

11.2.39.2.2 IInternetEnvOptions.GetHTMLExt Method

Pascal

```
function GetHTMLExt: string;
```

C++

```
__fastcall UnicodeString GetHTMLExt();
```

Description

This is GetHTMLExt, a member of class IInternetEnvOptions.

11.2.39.2.3 IInternetEnvOptions.GetSampleImageFile Method

Pascal

```
function GetSampleImageFile: string;
```

C++

```
__fastcall UnicodeString GetSampleImageFile();
```

Description

This is GetSampleImageFile, a member of class IInternetEnvOptions.

11.2.39.2.4 IInternetEnvOptions.GetScriptTimeoutSecs Method

Pascal

```
function GetScriptTimeoutSecs: Integer;
```

C++

```
__fastcall int GetScriptTimeoutSecs();
```

Description

This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

11.2.39.3 IInternetEnvOptions Properties

The properties of the IInternetEnvOptions class are listed here.

Public Properties

	Name	Description
	DisableDebugger (see page 1044)	This is DisableDebugger, a member of class IInternetEnvOptions.
	HTMLExt (see page 1045)	This is HTMLExt, a member of class IInternetEnvOptions.
	SampleImageFile (see page 1045)	This is SampleImageFile, a member of class IInternetEnvOptions.
	ScriptTimeoutSecs (see page 1045)	This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

11.2.39.3.1 IInternetEnvOptions.DisableDebugger Property

Pascal

```
property DisableDebugger: Boolean;
```

C++

```
__property Boolean DisableDebugger;
```

Description

This is DisableDebugger, a member of class IInternetEnvOptions.

11.2.39.3.2 IInternetEnvOptions.HTMLExt Property

Pascal

```
property HTMLExt: string;
```

C++

```
__property UnicodeString HTMLExt;
```

Description

This is HTMLExt, a member of class IInternetEnvOptions.

11.2.39.3.3 IInternetEnvOptions.SampleImageFile Property

Pascal

```
property SampleImageFile: string;
```

C++

```
__property UnicodeString SampleImageFile;
```

Description

This is SampleImageFile, a member of class IInternetEnvOptions.

11.2.39.3.4 IInternetEnvOptions.ScriptTimeoutSecs Property

Pascal

```
property ScriptTimeoutSecs: Integer;
```

C++

```
__property int ScriptTimeoutSecs;
```

Description

This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

11.2.40 IInternetExecuteScript Interface

Class Hierarchy

Pascal

```
IInternetExecuteScript = interface;
```

C++

```
__interface IInternetExecuteScript;
```

File

SiteComp

Description

This is class SiteComp.IInternetExecuteScript.

11.2.40.1 IInternetExecuteScript Members

The following tables list the members exposed by IInternetExecuteScript.

Public Methods

	Name	Description
	CanExecuteScript (see page 1046)	This is CanExecuteScript, a member of class IInternetExecuteScript.
	ExecuteScript (see page 1046)	This is ExecuteScript, a member of class IInternetExecuteScript.

11.2.40.2 IInternetExecuteScript Methods

The methods of the IInternetExecuteScript class are listed here.

Public Methods

	Name	Description
	CanExecuteScript (see page 1046)	This is CanExecuteScript, a member of class IInternetExecuteScript.
	ExecuteScript (see page 1046)	This is ExecuteScript, a member of class IInternetExecuteScript.

11.2.40.2.1 IInternetExecuteScript.CanExecuteScript Method

Pascal

```
function CanExecuteScript(AContext: IUnknown): Boolean;
```

C++

```
__fastcall Boolean CanExecuteScript(IUnknown AContext);
```

Description

This is CanExecuteScript, a member of class IInternetExecuteScript.

11.2.40.2.2 IInternetExecuteScript.ExecuteScript Method

Pascal

```
procedure ExecuteScript(AContext: IUnknown);
```

C++

```
__fastcall ExecuteScript(IUnknown AContext);
```

Description

This is ExecuteScript, a member of class IInternetExecuteScript.

11.2.41 IInternetFileTypes Interface

Class Hierarchy

Pascal

```
IInternetFileTypes = interface;
```

C++

```
__interface IInternetFileTypes;
```

File

SiteComp

Description

This is class SiteComp.IInternetFileTypes.

11.2.41.1 IInternetFileTypes Members

The following tables list the members exposed by IInternetFileTypes.

Public Methods

	Name	Description
	FindFileExt (see page 1047)	This is FindFileExt, a member of class IInternetFileTypes.

11.2.41.2 IInternetFileTypes Methods

The methods of the IInternetFileTypes class are listed here.

Public Methods

	Name	Description
	FindFileExt (see page 1047)	This is FindFileExt, a member of class IInternetFileTypes.

11.2.41.2.1 IInternetFileTypes.FindFileExt Method

Pascal

```
function FindFileExt(const AFileExt: string): TAbstractInetFileType;
```

C++

```
__fastcall TAbstractInetFileType FindFileExt(const UnicodeString AFileExt);
```

Description

This is FindFileExt, a member of class IInternetFileTypes.

11.2.42 IInternetScriptDebugger Interface

Class Hierarchy

Pascal

```
IInternetScriptDebugger = interface;
```

C++

```
__interface IInternetScriptDebugger;
```

File

SiteComp

Description

This is class SiteComp.IInternetScriptDebugger.

11.2.42.1 IInternetScriptDebugger Members

The following tables list the members exposed by IInternetScriptDebugger.

Public Methods

	Name	Description
	CanDebugScript (see page 1048)	This is CanDebugScript, a member of class IInternetScriptDebugger.
	DebugScript (see page 1049)	This is DebugScript, a member of class IInternetScriptDebugger.

11.2.42.2 IInternetScriptDebugger Methods

The methods of the IInternetScriptDebugger class are listed here.

Public Methods

	Name	Description
	CanDebugScript (see page 1048)	This is CanDebugScript, a member of class IInternetScriptDebugger.
	DebugScript (see page 1049)	This is DebugScript, a member of class IInternetScriptDebugger.

11.2.42.2.1 IInternetScriptDebugger.CanDebugScript Method

Pascal

```
function CanDebugScript(AContext: IUnknown): Boolean;
```

C++

```
__fastcall Boolean CanDebugScript(IUnknown AContext);
```

Description

This is CanDebugScript, a member of class IInternetScriptDebugger.

11.2.42.2.2 IInternetScriptDebugger.DebugScript Method

Pascal

```
procedure DebugScript(AContext: IUnknown);
```

C++

```
__fastcall DebugScript(IUnknown AContext);
```

Description

This is DebugScript, a member of class IInternetScriptDebugger.

11.2.43 IIsAdapterActionList Interface

Class Hierarchy

SiteComp.IIsAdapterActionList

Pascal

```
IIsAdapterActionList = interface;
```

C++

```
__interface IIsAdapterActionList;
```

File

SiteComp

Description

This is class SiteComp.IIsAdapterActionList.

11.2.43.1 IIsAdapterActionList Members

The following tables list the members exposed by IIsAdapterActionList.

Public Methods

	Name	Description
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

Public Properties

	Name	Description
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.

11.2.43.2 IIsAdapterActionList Methods

The methods of the IIsAdapterActionList class are listed here.

Public Methods

	Name	Description
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

11.2.43.2.1 IIsAdapterActionList.GetIsAdapterActionList Method

Pascal

```
function GetIsAdapterActionList: Boolean;
```

C++

```
__fastcall Boolean GetIsAdapterActionList();
```

Description

This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

11.2.43.3 IIsAdapterActionList Properties

The properties of the IIsAdapterActionList class are listed here.

Public Properties

	Name	Description
	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.

11.2.43.3.1 IIsAdapterActionList.IsAdapterActionList Property

Pascal

```
property IsAdapterActionList: Boolean;
```

C++

```
__property Boolean IsAdapterActionList;
```

Description

This is IsAdapterActionList, a member of class IIsAdapterActionList.

11.2.44 IIterateIntfSupport Interface

Class Hierarchy

Pascal

```
IIterateIntfSupport = interface(IIteratorSupport);
```

C++

```
__interface IIterateIntfSupport : public IIteratorSupport;
```

File

SiteComp

Description

This is class SiteComp.IIterateIntfSupport.

11.2.44.1 IIterateIntfSupport Members

The following tables list the members exposed by IIterateIntfSupport.

Public Methods

	Name	Description
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentIntf (see page 1051)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

11.2.44.2 IIterateIntfSupport Methods

The methods of the IIterateIntfSupport class are listed here.

Public Methods

	Name	Description
	GetCurrentIntf (see page 1051)	This is GetCurrentIntf, a member of class IIterateIntfSupport.

11.2.44.2.1 IIterateIntfSupport.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class IIterateIntfSupport.

11.2.45 IIterateObjectSupport Interface

Class Hierarchy

Pascal

```
IIterateObjectSupport = interface(IIteratorSupport);
```

C++

```
__interface IIterateObjectSupport : public IIteratorSupport;
```

File

SiteComp

Description

This is class SiteComp.IIterateObjectSupport.

11.2.45.1 IIterateObjectSupport Members

The following tables list the members exposed by IIterateObjectSupport.

Public Methods

	Name	Description
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

11.2.45.2 IIterateObjectSupport Methods

The methods of the IIterateObjectSupport class are listed here.

Public Methods

	Name	Description
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.

11.2.45.2.1 IIterateObjectSupport.GetCurrentObject Method

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

This is GetCurrentObject, a member of class IIterateObjectSupport.

11.2.46 IIteratorIndex Interface

IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.

Class Hierarchy

Pascal

```
IIteratorIndex = interface;
```

C++

```
__interface IIteratorIndex;
```

File

SiteComp

Description

Server-side script uses the IIteratorIndex interface to detect when an object is in the middle of an enumeration, and if it is, to determine the item on which the object is positioned. This interface is used in conjunction with the IIteratorSupport (see page

1054) interface to enable server-side script to iterate over the items of an adapter or one of its sub-components.

Note: In C++, method declarations that use IIteratorIndex use the _di_IIteratorIndex type instead. This type is a DelphiInterface (see page 3256) wrapper around the IIteratorIndex interface:

Note: typedef System::DelphiInterface (see page 3256)< IIteratorIndex > _di_IIteratorIndex;

See Also

IIteratorSupport (see page 1054)

11.2.46.1 IIteratorIndex Members

The following tables list the members exposed by IIteratorIndex.

Public Methods

	Name	Description
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.

Public Properties

	Name	Description
R	IteratorIndex (see page 1054)	Indicates the index of the current item.

11.2.46.2 IIteratorIndex Methods

The methods of the IIteratorIndex class are listed here.

Public Methods

	Name	Description
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.

11.2.46.2.1 IIteratorIndex.GetIteratorIndex Method

Returns the value of the IteratorIndex (see page 1054) property.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

GetIteratorIndex is the read implementation for the IteratorIndex (see page 1054) property.

See Also

IteratorIndex (see page 1054)

11.2.46.2.2 IIteratorIndex.InIterator Method

Indicates whether the object is iterating over its items.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

InIterator returns true if the object is iterating over its items. It returns false if an iteration never started or if an iteration process finished. When InIterator returns false, the current position of the object is indeterminate. In this case, the IteratorIndex (see page 1054) property's value can't be used.

See Also

InIterator (see page 5562)

IIteratorSupport (see page 1054)

11.2.46.3 IIteratorIndex Properties

The properties of the IIteratorIndex class are listed here.

Public Properties

	Name	Description
	IteratorIndex (see page 1054)	Indicates the index of the current item.

11.2.46.3.1 IIteratorIndex.IteratorIndex Property

Indicates the index of the current item.

Pascal

```
property IteratorIndex: Integer;
```

C++

```
__property int IteratorIndex;
```

Description

IteratorIndex indicates the index of the current item when the object is iterating over its items. When IteratorIndex is 0, the object is positioned on its first item; When IteratorIndex is 1, the object is positioned on its second item, and so on.

When the object is not iterating over its items (when the InIterator (see page 1053) method returns false), the value of IteratorIndex is undefined.

See Also

InIterator (see page 1053)

11.2.47 IIteratorSupport Interface

IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.

Class Hierarchy

Pascal

```
IIteratorSupport = interface;
```

C++

```
__interface IIteratorSupport;
```

File

SiteComp

Description

Server-side script uses the IIteratorSupport interface to enumerate the items of an adapter or one of its sub-components. When the server-side script includes an enumerator, the WebSnap application automatically generates calls to the IIteratorSupport methods of the object that contains the items to enumerate.

The WebSnap application first calls the StartIterator (see page 1056) method to position the object on its first item. To advance to the next item, the application calls the NextIteration (see page 1056) method. Finally, the application calls the EndIterator (see page 1056) method to signal the end of the iteration.

Each object that implements IIteratorSupport determines the items over which it iterates. For example, if the object is an adapter, these can be records or pages that the adapter uses to group information, or name/value pairs that the adapter represents. If the object is a list of fields or actions, these can be the fields or actions in the list. If the object is an adapter field, these can be the possible values of the field. If the object is an adapter action, these can be the commands the action can execute.

Note: In C++, method declarations that use IIteratorSupport use the _di_IIteratorSupport type instead. This type is a DelphiInterface (see page 3256) wrapper around the IIteratorSupport interface:

Note: typedef System::DelphiInterface (see page 3256)< IIteratorSupport > _di_IIteratorSupport;

See Also

IIteratorIndex (see page 1052)

11.2.47.1 IIteratorSupport Members

The following tables list the members exposed by IIteratorSupport.

Public Methods

	Name	Description
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	NextIteration (see page 1056)	Advances to the objects next item.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

11.2.47.2 IIteratorSupport Methods

The methods of the IIteratorSupport class are listed here.

Public Methods

	Name	Description
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	NextIteration (see page 1056)	Advances to the objects next item.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

11.2.47.2.1 IIteratorSupport.EndIterator Method

Signals the end of the iterating operation.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

Server-side script calls EndIterator when it stops iterating over the object's items. The object uses this method to perform any clean-up to reflect the fact that it is no longer iterating over its items.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator (see page 1056) method. It is passed to each NextIteration (see page 1056) call (which can modify the information), and finally supplied to the EndIterator method, which can free the memory used to store the information.

See Also

StartIterator (see page 1056)

NextIteration (see page 1056)

11.2.47.2.2 IIteratorSupport.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator (see page 1056) method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator (see page 1056) method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

StartIterator (see page 1056)

EndIterator (see page 1056)

11.2.47.2.3 IIteratorSupport.StartIterator Method

Positions the object on its first item and starts the iteration process.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

Server-side script calls StartIterator to begin iterating over the object's items.

OwnerData returns a pointer to information that the object can use to influence the iteration process. StartIterator initializes this information to reflect what ever information the object needs to communicate to itself as it advances over its items. This pointer is then passed to the next call to the NextIteration (see page 1056) or EndIterator (see page 1056) method.

StartIterator returns true if it successfully moves to the first item, false if there are no items to iterate.

See Also

NextIteration (see page 1056)

EndIterator (see page 1056)

11.2.48 INotifyAdapterChange Interface

INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.

Class Hierarchy

Pascal

```
INotifyAdapterChange = interface;
```

C++

```
__interface INotifyAdapterChange;
```

File

SiteComp

Description

Objects that depend on the fields, actions, or properties of an adapter implement the INotifyAdapterChange interface so that the adapter can notify them of changes. They register an interest in such notifications using the adapter's INotifyList (see page 1058) interface. Then, when the adapter changes, it uses this interface to inform them of the change. They can remove themselves from the adapter's notification list using the INotifyList (see page 1058) interface.

See Also

TCustomAdapter (see page 5531)

INotifyList (see page 1058)

11.2.48.1 INotifyAdapterChange Members

The following tables list the members exposed by INotifyAdapterChange.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.

11.2.48.2 INotifyAdapterChange Methods

The methods of the INotifyAdapterChange class are listed here.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.

11.2.48.2.1 INotifyAdapterChange.NotifyAdapterChange Method

Responds when the adapter changes.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is the method objects implement to respond when the associated adapter changes.

Sender is the adapter component that changed.

11.2.49 INotifyList Interface

INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.

Class Hierarchy

Pascal

```
INotifyList = interface;
```

C++

```
__interface INotifyList;
```

File

SiteComp

Description

WebSnap components that let other objects register interest in their changes implement INotifyList. When another object wants to be informed of changes, it calls the AddNotify (see page 1059) method. Then, when the component that implements INotifyList changes, it informs all of the objects that have called AddNotify (see page 1059) of the change. When an object wants to unregister its interest, it calls the RemoveNotify (see page 1059) method.

See Also

TNotifyList (see page 968)

11.2.49.1 INotifyList Members

The following tables list the members exposed by INotifyList.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

11.2.49.2 INotifyList Methods

The methods of the INotifyList class are listed here.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

11.2.49.2.1 INotifyList.AddNotify Method

Registers an interest in change notifications.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to register an interest in change notifications. After a call to AddNotify, the object is notified every time the component changes, until it unregisters its interest by a call to the RemoveNotify (see page 1059) method.

ANotify is the object to notify of changes. It should implement an interface that allows the notifying component to call it when changes occur. What interface this is depends on the component that implements INotifyList (see page 1058).

See Also

RemoveNotify (see page 1059)

11.2.49.2.2 INotifyList.RemoveNotify Method

Unregisters interest in change notifications.
