

## NAG C Library Function Document

### nag\_real\_sym\_posdef\_packed\_lin\_solve (f04bec)

#### 1 Purpose

nag\_real\_sym\_posdef\_packed\_lin\_solve (f04bec) computes the solution to a real system of linear equations  $AX = B$ , where  $A$  is an  $n$  by  $n$  symmetric positive-definite matrix, stored in packed format, and  $X$  and  $B$  are  $n$  by  $r$  matrices. An estimate of the condition number of  $A$  and an error bound for the computed solution are also returned.

#### 2 Specification

```
#include <nag.h>
#include <nagf04.h>

void nag_real_sym_posdef_packed_lin_solve (Nag_OrderType order,
    Nag_UploType uplo, Integer n, Integer nrhs, double ap[], double b[],
    Integer pdb, double *rcond, double *errbnd, NagError *fail)
```

#### 3 Description

The Cholesky factorization is used to factor  $A$  as  $A = U^T U$ , if **uplo** = **Nag\_Upper**, or  $A = LL^T$ , if **uplo** = **Nag\_Lower**, where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $AX = B$ .

#### 5 Arguments

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag\_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this argument.  
*Constraint:* **order** = **Nag\_RowMajor** or **Nag\_ColMajor**.
- 2: **uplo** – Nag\_UploType *Input*  
*On entry:* if **uplo** = **Nag\_Upper**, the upper triangle of the matrix  $A$  is stored.  
 If **uplo** = **Nag\_Lower**, the lower triangle of the matrix  $A$  is stored.  
*Constraint:* **uplo** = **Nag\_Upper** or **Nag\_Lower**.
- 3: **n** – Integer *Input*  
*On entry:* the number of linear equations  $n$ , i.e., the order of the matrix  $A$ .  
*Constraint:* **n**  $\geq 0$ .

- 4: **nrhs** – Integer *Input*  
*On entry:* the number of right-hand sides  $r$ , i.e., the number of columns of the matrix  $B$ .  
*Constraint:* **nrhs**  $\geq 0$ .
- 5: **ap**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **ap** must be at least  $\max(1, n \times (n + 1)/2)$ .  
*On entry:* the  $n$  by  $n$  symmetric matrix  $A$ . The upper or lower triangular part of the symmetric matrix is packed column-wise in a linear array. The  $j$ th column of  $A$  is stored in the array **ap** as follows:  
     if **uplo** = **Nag\_Upper**, **ap**[ $i + (j - 1)j/2$ ] =  $a_{ij}$  for  $1 \leq i \leq j$ ;  
     if **uplo** = **Nag\_Lower**, **ap**[ $i + (j - 1)(2n - j)/2$ ] =  $a_{ij}$  for  $j \leq i \leq n$ .  
 See Section 8 below for further details.  
*On exit:* if **fail.code** = **NE\_NOERROR** or **NE\_RCOND**, the factor  $U$  or  $L$  from the Cholesky factorization  $A = U^T U$  or  $A = LL^T$ , in the same storage format as  $A$ .
- 6: **b**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **b** must be at least  
      $\max(1, \text{pdb} \times \text{nrhs})$  when **order** = **Nag\_ColMajor**;  
      $\max(1, \text{pdb} \times n)$  when **order** = **Nag\_RowMajor**.  
 If **order** = **Nag\_ColMajor**, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[( $j - 1$ )  $\times$  **pdb** +  $i - 1$ ].  
 If **order** = **Nag\_RowMajor**, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[( $i - 1$ )  $\times$  **pdb** +  $j - 1$ ].  
*On entry:* the  $n$  by  $r$  matrix of right-hand sides  $B$ .  
*On exit:* if **fail.code** = **NE\_NOERROR** or **NE\_RCOND**, the  $n$  by  $r$  solution matrix  $X$ .
- 7: **pdb** – Integer *Input*  
*On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.  
*Constraints:*  
     if **order** = **Nag\_ColMajor**, **pdb**  $\geq \max(1, n)$ ;  
     if **order** = **Nag\_RowMajor**, **pdb**  $\geq \max(1, \text{nrhs})$ .
- 8: **rcond** – double \* *Output*  
*On exit:* if **fail.code** = **NE\_NOERROR** or **NE\_RCOND**, an estimate of the reciprocal of the condition number of the matrix  $A$ , computed as  $\text{rcond} = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .
- 9: **errbnd** – double \* *Output*  
*On exit:* if **fail.code** = **NE\_NOERROR** or **NE\_RCOND**, an estimate of the forward error bound for a computed solution  $\hat{x}$ , such that  $\|\hat{x} - x\|_1 / \|x\|_1 \leq \text{errbnd}$ , where  $\hat{x}$  is a column of the computed solution returned in the array **b** and  $x$  is the corresponding column of the exact solution  $X$ . If **rcond** is less than *machine precision*, then **errbnd** is returned as unity.
- 10: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.6 of the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

On entry,  $\mathbf{nrhs} = \langle value \rangle$ .

Constraint:  $\mathbf{nrhs} \geq 0$ .

On entry,  $\mathbf{pdb} = \langle value \rangle$ .

Constraint:  $\mathbf{pdb} > 0$ .

### NE\_INT\_2

On entry,  $\mathbf{pdb} = \langle value \rangle$ ,  $\mathbf{n} = \langle value \rangle$ . Constraint:  $\mathbf{pdb} \geq \max(1, \mathbf{n})$ .

On entry,  $\mathbf{pdb} = \langle value \rangle$ ,  $\mathbf{nrhs} = \langle value \rangle$ .

Constraint:  $\mathbf{pdb} \geq \max(1, \mathbf{nrhs})$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

### NE\_POS\_DEF

The principal minor of order  $\langle value \rangle$  of the matrix  $A$  is not positive-definite. The factorization has not been completed and the solution could not be computed.

### NE\_RCOND

A solution has been computed, but **rcond** is less than *machine precision* so that the matrix  $A$  is numerically singular.

## 7 Accuracy

The computed solution for a single right-hand side,  $\hat{x}$ , satisfies an equation of the form

$$(A + E)\hat{x} = b,$$

where

$$\|E\|_1 = O(\epsilon)\|A\|_1$$

and  $\epsilon$  is the *machine precision*. An approximate error bound for the computed solution is given by

$$\frac{\|\hat{x} - x\|_1}{\|x\|_1} \leq \kappa(A) \frac{\|E\|_1}{\|A\|_1},$$

where  $\kappa(A) = \|A^{-1}\|_1 \|A\|_1$ , the condition number of  $A$  with respect to the solution of the linear equations. `nag_real_sym_posdef_packed_lin_solve (f04bec)` uses the approximation  $\|E\|_1 = \epsilon \|A\|_1$  to estimate **errbnd**. See Section 4.4 of Anderson *et al.* (1999) for further details.

## 8 Further Comments

The packed storage scheme is illustrated by the following example when  $n = 4$  and **uplo** = **Nag\_Upper**. Two-dimensional storage of the symmetric matrix  $A$ :

$$\begin{array}{cccc} a_{11} & a_{12} & a_{13} & a_{14} \\ & a_{22} & a_{23} & a_{24} \\ & & a_{33} & a_{34} \\ & & & a_{44} \end{array} \quad (a_{ij} = a_{ji})$$

Packed storage of the upper triangle of  $A$ :

$$\mathbf{ap} = [a_{11}, a_{12}, a_{22}, a_{13}, a_{23}, a_{33}, a_{14}, a_{24}, a_{34}, a_{44}]$$

The total number of floating-point operations required to solve the equations  $AX = B$  is proportional to  $(\frac{1}{3}n^3 + n^2r)$ . The condition number estimation typically requires between four and five solves and never more than eleven solves, following the factorization.

In practice the condition number estimator is very reliable, but it can underestimate the true condition number; see Section 15.3 of Higham (2002) for further details.

The complex analogue of `nag_real_sym_posdef_packed_lin_solve (f04bec)` is `nag_herm_posdef_packed_lin_solve (f04cec)`.

## 9 Example

To solve the equations

$$AX = B,$$

where  $A$  is the symmetric positive-definite matrix

$$A = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 8.70 & 8.30 \\ -13.35 & 2.13 \\ 1.89 & 1.61 \\ -4.14 & 5.00 \end{pmatrix}.$$

An estimate of the condition number of  $A$  and an approximate error bound for the computed solutions are also printed.
