

NAG C Library Function Document

nag_dgbcon (f07bgc)

1 Purpose

nag_dgbcon (f07bgc) estimates the condition number of a real band matrix A , where A has been factorized by nag_dgbtrf (f07bdc).

2 Specification

```
void nag_dgbcon (Nag_OrderType order, Nag_NormType norm, Integer n, Integer kl,
                Integer ku, const double ab[], Integer pdab, const Integer ipiv[],
                double anorm, double *rcond, NagError *fail)
```

3 Description

nag_dgbcon (f07bgc) estimates the condition number of a real band matrix A , in either the 1-norm or the infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \quad \text{or} \quad \kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty.$$

Note that $\kappa_\infty(A) = \kappa_1(A^T)$.

Because the condition number is infinite if A is singular, the function actually returns an estimate of the **reciprocal** of the condition number.

The function should be preceded by a call to nag_dgb_norm (f16rbc) to compute $\|A\|_1$ or $\|A\|_\infty$, and a call to nag_dgbtrf (f07bdc) to compute the LU factorization of A . The function then uses Higham's implementation of Hager's method (see Higham (1988)) to estimate $\|A^{-1}\|_1$ or $\|A^{-1}\|_\infty$.

5 Parameters

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.
- 2: **norm** – Nag_NormType *Input*
On entry: indicates whether $\kappa_1(A)$ or $\kappa_\infty(A)$ is estimated as follows:
 - if **norm = Nag_OneNorm**, $\kappa_1(A)$ is estimated;
 - if **norm = Nag_InfNorm**, $\kappa_\infty(A)$ is estimated.*Constraint:* **norm = Nag_OneNorm** or **Nag_InfNorm**.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.

- 4: **kl** – Integer *Input*
On entry: k_l , the number of sub-diagonals within the band of A .
Constraint: $\mathbf{kl} \geq 0$.
- 5: **ku** – Integer *Input*
On entry: k_u , the number of super-diagonals within the band of A .
Constraint: $\mathbf{ku} \geq 0$.
- 6: **ab**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **ab** must be at least $\max(1, \mathbf{pdab} \times \mathbf{n})$.
On entry: the LU factorization of A , as returned by nag_dgbtrf (f07bdc).
- 7: **pdab** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **ab**.
Constraint: $\mathbf{pdab} \geq 2 \times \mathbf{kl} + \mathbf{ku} + 1$.
- 8: **ipiv**[*dim*] – const Integer *Input*
Note: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.
On entry: the pivot indices, as returned by nag_dgbtrf (f07bdc).
- 9: **anorm** – double *Input*
On entry: if **norm** = **Nag_OneNorm**, the 1-norm of the **original** matrix A ; if **norm** = **Nag_InfNorm**, the infinity-norm of the **original** matrix A . **anorm** may be computed by calling nag_dgb_norm (f16rbc) with the same value for the parameter **norm**. **anorm** must be computed either **before** calling nag_dgbtrf (f07bdc) or else from a **copy** of the original matrix A .
Constraint: $\mathbf{anorm} \geq 0.0$.
- 10: **rcond** – double * *Output*
On exit: an estimate of the reciprocal of the condition number of A . **rcond** is set to zero if exact singularity is detected or the estimate underflows. If **rcond** is less than *machine precision*, A is singular to working precision.
- 11: **fail** – NagError * *Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.
Constraint: $\mathbf{n} \geq 0$.

On entry, **kl** = $\langle value \rangle$.
Constraint: $\mathbf{kl} \geq 0$.

On entry, **ku** = $\langle value \rangle$.
Constraint: $\mathbf{ku} \geq 0$.

On entry, **pdab** = $\langle value \rangle$.
Constraint: $\mathbf{pdab} > 0$.

NE_INT_3

On entry, **pdab** = $\langle value \rangle$, **kl** = $\langle value \rangle$, **ku** = $\langle value \rangle$.
 Constraint: **pdab** $\geq 2 \times \mathbf{kl} + \mathbf{ku} + 1$.

NE_REAL

On entry, **anorm** = $\langle value \rangle$.
 Constraint: **anorm** ≥ 0.0 .

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed estimate **rcond** is never less than the true value ρ , and in practice is nearly always less than 10ρ , although examples can be constructed where **rcond** is much larger.

8 Further Comments

A call to nag_dgbcon (f07bgc) involves solving a number of systems of linear equations of the form $Ax = b$ or $A^T x = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately $2n(2k_l + k_u)$ floating-point operations (assuming $n \gg k_l$ and $n \gg k_u$) but takes considerably longer than a call to nag_dgbtrs (f07bec) with 1 right-hand side, because extra care is taken to avoid overflow when A is approximately singular.

The complex analogue of this function is nag_zgbcon (f07buc).

9 Example

To estimate the condition number in the 1-norm of the matrix A , where

$$A = \begin{pmatrix} -0.23 & 2.54 & -3.66 & 0.00 \\ -6.98 & 2.46 & -2.73 & -2.13 \\ 0.00 & 2.56 & 2.46 & 4.07 \\ 0.00 & 0.00 & -4.78 & -3.82 \end{pmatrix}.$$

Here A is nonsymmetric and is treated as a band matrix, which must first be factorized by nag_dgbtrf (f07bdc). The true condition number in the 1-norm is 56.40.
