

NAG C Library Function Document

nag_dpbtrs (f07hec)

1 Purpose

nag_dpbtrs (f07hec) solves a real symmetric positive-definite band system of linear equations with multiple right-hand sides, $AX = B$, where A has been factorized by nag_dpbtrf (f07hdc).

2 Specification

```
void nag_dpbtrs (Nag_OrderType order, Nag_UploType uplo, Integer n, Integer kd,
                Integer nrhs, const double ab[], Integer pdab, double b[], Integer pdb,
                NagError *fail)
```

3 Description

To solve a real symmetric positive-definite band system of linear equations $AX = B$, this function must be preceded by a call to nag_dpbtrf (f07hdc) which computes the Cholesky factorization of A . The solution X is computed by forward and backward substitution.

If **uplo** = **Nag_Upper**, $A = U^T U$, where U is upper triangular; the solution X is computed by solving $U^T Y = B$ and then $UX = Y$.

If **uplo** = **Nag_Lower**, $A = LL^T$, where L is lower triangular; the solution X is computed by solving $LY = B$ and then $L^T X = Y$.

5 Parameters

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.
- 2: **uplo** – Nag_UploType *Input*
On entry: indicates whether A has been factorized as $U^T U$ or LL^T as follows:
 if **uplo** = **Nag_Upper**, $A = U^T U$, where U is upper triangular;
 if **uplo** = **Nag_Lower**, $A = LL^T$, where L is lower triangular.
Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.

- 4: **kd** – Integer *Input*
On entry: k , the number of super-diagonals or sub-diagonals of the matrix A .
Constraint: $\mathbf{kd} \geq 0$.
- 5: **nrhs** – Integer *Input*
On entry: r , the number of right-hand sides.
Constraint: $\mathbf{nrhs} \geq 0$.
- 6: **ab**[dim] – const double *Input*
Note: the dimension, dim , of the array **ab** must be at least $\max(1, \mathbf{pdab} \times \mathbf{n})$.
On entry: the Cholesky factor of A , as returned by nag_dpbtrf (f07hdc).
- 7: **pdab** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **ab**.
Constraint: $\mathbf{pdab} \geq \mathbf{kd} + 1$.
- 8: **b**[dim] – double *Input/Output*
Note: the dimension, dim , of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor and at least $\max(1, \mathbf{pdb} \times \mathbf{n})$ when **order** = Nag_RowMajor.
If **order** = Nag_ColMajor, the (i, j) th element of the matrix B is stored in $\mathbf{b}[(j-1) \times \mathbf{pdb} + i - 1]$ and if **order** = Nag_RowMajor, the (i, j) th element of the matrix B is stored in $\mathbf{b}[(i-1) \times \mathbf{pdb} + j - 1]$.
On entry: the n by r right-hand side matrix B .
On exit: the n by r solution matrix X .
- 9: **pdb** – Integer *Input*
On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.
Constraints:
if **order** = Nag_ColMajor, $\mathbf{pdb} \geq \max(1, \mathbf{n})$;
if **order** = Nag_RowMajor, $\mathbf{pdb} \geq \max(1, \mathbf{nrhs})$.
- 10: **fail** – NagError * *Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: $\mathbf{n} \geq 0$.

On entry, **kd** = $\langle value \rangle$.

Constraint: $\mathbf{kd} \geq 0$.

On entry, **nrhs** = $\langle value \rangle$.

Constraint: $\mathbf{nrhs} \geq 0$.

On entry, **pdab** = $\langle value \rangle$.

Constraint: $\mathbf{pdab} > 0$.

On entry, **pdb** = $\langle value \rangle$.

Constraint: $\mathbf{pdb} > 0$.

NE_INT_2

On entry, **pdab** = $\langle value \rangle$, **kd** = $\langle value \rangle$.

Constraint: **pdab** $\geq$ **kd** + 1.

On entry, **pdb** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pdb** $\geq$ max(1, **n**).

On entry, **pdb** = $\langle value \rangle$, **nrhs** = $\langle value \rangle$.

Constraint: **pdb** $\geq$ max(1, **nrhs**).

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

For each right-hand side vector b , the computed solution x is the exact solution of a perturbed system of equations $(A + E)x = b$, where

if **uplo** = **Nag_Upper**, $|E| \leq c(k+1)\epsilon|U^T||U|$;

if **uplo** = **Nag_Lower**, $|E| \leq c(k+1)\epsilon|L||L^T|$,

$c(k+1)$ is a modest linear function of $k+1$, and ϵ is the *machine precision*.

If $\hat{x}$ is the true solution, then the computed solution x satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_{\infty}}{\|x\|_{\infty}} \leq c(k+1) \text{cond}(A, x) \epsilon$$

where $\text{cond}(A, x) = \|A^{-1}\| \|A\| \|x\|_{\infty} / \|x\|_{\infty} \leq \text{cond}(A) = \|A^{-1}\| \|A\|_{\infty} \leq \kappa_{\infty}(A)$. Note that $\text{cond}(A, x)$ can be much smaller than $\text{cond}(A)$. Forward and backward error bounds can be computed by calling `nag_dpbrfs` (f07hhc), and an estimate for $\kappa_{\infty}(A)$ ($= \kappa_1(A)$) can be obtained by calling `nag_dpbrcon` (f07hgc).

8 Further Comments

The total number of floating-point operations is approximately $4nkr$, assuming $n \gg k$.

This function may be followed by a call to `nag_dpbrfs` (f07hhc) to refine the solution and return an error estimate.

The complex analogue of this function is `nag_zpbtrs` (f07hsc).

9 Example

To solve the system of equations $AX = B$, where

$$A = \begin{pmatrix} 5.49 & 2.68 & 0.00 & 0.00 \\ 2.68 & 5.63 & -2.39 & 0.00 \\ 0.00 & -2.39 & 2.60 & -2.22 \\ 0.00 & 0.00 & -2.22 & 5.17 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 22.09 & 5.10 \\ 9.31 & 30.81 \\ -5.24 & -25.82 \\ 11.83 & 22.90 \end{pmatrix}.$$

Here A is symmetric and positive-definite, and is treated as a band matrix, which must first be factorized by `nag_dpbtrf` (f07hdc).
