NAG C Library Function Document

nag_zhecon (f07muc)

1 Purpose

nag_zhecon (f07muc) estimates the condition number of a complex Hermitian indefinite matrix A, where A has been factorized by nag_zhetrf (f07mrc).

2 Specification

```
void nag_zhecon (Nag_OrderType order, Nag_UploType uplo, Integer n,
     const Complex a[], Integer pda, const Integer ipiv[], double anorm,
     double *rcond, NagError *fail)
```

3 Description

nag_zhecon (f07muc) estimates the condition number (in the 1-norm) of a complex Hermitian indefinite matrix A:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1.$$

Since A is Hermitian, $\kappa_1(A) = \kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty$.

Because $\kappa_1(A)$ is infinite if A is singular, the function actually returns an estimate of the **reciprocal** of $\kappa_1(A)$.

The function should be preceded by a call to nag_zhe_norm (f16ucc) to compute $\|A\|_1$ and a call to nag_zhetrf (f07mrc) to compute the Bunch–Kaufman factorization of A. The function then uses Higham's implementation of Hager's method (see Higham (1988)) to estimate $\|A^{-1}\|_1$.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.

2: **uplo** – Nag_UploType *Input*

On entry: indicates how A has been factorized as follows:

if **uplo** = **Nag_Upper**, $A = PUDU^HP^T$, where U is upper triangular;

if **uplo** = **Nag_Lower**, $A = PLDL^HP^T$, where L is lower triangular.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

3: **n** – Integer *Input*

On entry: n, the order of the matrix A.

Constraint: **n** ≥ 0.

4: **a**[dim] – const Complex *Input*

Note: the dimension, dim, of the array **a** must be at least $\max(1, \textbf{pda} \times \textbf{n})$.

On entry: details of the factorization of A, as returned by nag_zhetrf (f07mrc).

5: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.

Constraint: **pda** $\geq \max(1, \textbf{n})$.

6: **ipiv**[dim] – const Integer *Input*

Note: the dimension, dim, of the array **ipiv** must be at least $\max(1, \textbf{n})$.

On entry: details of the interchanges and the block structure of D, as returned by nag_zhetrf (f07mrc).

7: **anorm** – double *Input*

On entry: the 1-norm of the **original** matrix A, which may be computed by calling nag_zhe_norm (f16ucc). **anorm** must be computed either **before** calling nag_zhetrf (f07mrc) or else from a copy of the original matrix A.

Constraint: **anorm** ≥ 0.0.

8: **rcond** – double * *Output*

On exit: an estimate of the reciprocal of the condition number of A. **rcond** is set to zero if exact singularity is detected or the estimate underflows. If **rcond** is less than ***machine precision***, A is singular to working precision.

9: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** > 0.

NE_INT_2

On entry, **pda** = ⟨*value*⟩, **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \textbf{n})$.

NE_REAL

On entry, **anorm** = ⟨*value*⟩.
Constraint: **anorm** ≥ 0.0.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter ⟨*value*⟩ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed estimate **rcond** is never less than the true value ρ, and in practice is nearly always less than 10ρ, although examples can be constructed where **rcond** is much larger.

8 Further Comments

A call to nag_zhecon (f07muc) involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 5 and never more than 11. Each solution involves approximately $8n^2$ real floating-point operations but takes considerably longer than a call to nag_zhetrs (f07msc) with 1 right-hand side, because extra care is taken to avoid overflow when A is approximately singular.

The real analogue of this function is nag_dsycon (f07mgc).

9 Example

To estimate the condition number in the 1-norm (or infinity-norm) of the matrix A, where

$$A = \begin{pmatrix} -1.36 + 0.00i & 1.58 + 0.90i & 2.21 - 0.21i & 3.91 + 1.50i \\ 1.58 - 0.90i & -8.87 + 0.00i & -1.84 - 0.03i & -1.78 + 1.18i \\ 2.21 + 0.21i & -1.84 + 0.03i & -4.63 + 0.00i & 0.11 + 0.11i \\ 3.91 - 1.50i & -1.78 - 1.18i & 0.11 - 0.11i & -1.84 + 0.00i \end{pmatrix}.$$

Here A is Hermitian indefinite and must first be factorized by nag_zhetrf (f07mrc). The true condition number in the 1-norm is 9.10.
