

NAG C Library Function Document

nag_zheevd (f08fqc)

1 Purpose

nag_zheevd (f08fqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian matrix. If the eigenvectors are requested, then it uses a divide-and-conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal–Walker–Kahan variant of the QL or QR algorithm.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
```

```
void nag_zheevd (Nag_OrderType order, Nag_JobType job, Nag_UploType uplo,
                Integer n, Complex a[], Integer pda, double w[], NagError *fail)
```

3 Description

nag_zheevd (f08fqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian matrix A . In other words, it can compute the spectral factorization of A as

$$A = ZAZ^H,$$

where A is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i , and Z is the (complex) unitary matrix whose columns are the eigenvectors z_i . Thus

$$Az_i = \lambda_i z_i, \quad i = 1, 2, \dots, n.$$

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.

2: **job** – Nag_JobType *Input*

On entry: indicates whether eigenvectors are computed.

job = Nag_DoNothing

Only eigenvalues are computed.

job = Nag_EigVecs

Eigenvalues and eigenvectors are computed.

Constraint: **job** = **Nag_DoNothing** or **Nag_EigVecs**.

3: **uplo** – Nag_UploType *Input*

On entry: indicates whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper

The upper triangular part of A is stored.

uplo = Nag_Lower

The lower triangular part of A is stored.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

4: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: $n \geq 0$.

5: **a**[dim] – Complex *Input/Output*

Note: the dimension, dim , of the array **a** must be at least $\max(1, pda \times n)$.

If **order** = **Nag_ColMajor**, the (i, j) th element of the matrix A is stored in **a**[($j - 1$) $\times$ **pda** + $i - 1$].

If **order** = **Nag_RowMajor**, the (i, j) th element of the matrix A is stored in **a**[($i - 1$) $\times$ **pda** + $j - 1$].

On entry: the n by n matrix A .

If **uplo** = **Nag_Upper**, the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.

If **uplo** = **Nag_Lower**, the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

On exit: if **job** = **Nag_EigVecs**, this is overwritten by the unitary matrix Z which contains the eigenvectors of A .

6: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **a**.

Constraint: $pda \geq \max(1, n)$.

7: **w**[dim] – double *Output*

Note: the dimension, dim , of the array **w** must be at least $\max(1, n)$.

On exit: the eigenvalues of the matrix A in ascending order.

8: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.6 of the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_CONVERGENCE

The algorithm failed to converge, $\langle value \rangle$ elements of an intermediate tridiagonal form did not converge to zero.

NE_INT

On entry, $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{n} \geq 0$.

On entry, $\mathbf{pda} = \langle value \rangle$.

Constraint: $\mathbf{pda} > 0$.

NE_INT_2

On entry, $\mathbf{pda} = \langle value \rangle$, $\mathbf{n} = \langle value \rangle$.

Constraint: $\mathbf{pda} \geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the *machine precision*. See Section 4.7 of Anderson *et al.* (1999) for further details.

8 Further Comments

The real analogue of this function is nag_dsyevd (f08fcc).

9 Example

To compute all the eigenvalues and eigenvectors of the Hermitian matrix A , where

$$A = \begin{pmatrix} 1.0 + 0.0i & 2.0 - 1.0i & 3.0 - 1.0i & 4.0 - 1.0i \\ 2.0 + 1.0i & 2.0 + 0.0i & 3.0 - 2.0i & 4.0 - 2.0i \\ 3.0 + 1.0i & 3.0 + 2.0i & 3.0 + 0.0i & 4.0 - 3.0i \\ 4.0 + 1.0i & 4.0 + 2.0i & 4.0 + 3.0i & 4.0 + 0.0i \end{pmatrix}.$$

The example program for nag_zheevd (f08fqc) illustrates the computation of error bounds for the eigenvalues and eigenvectors.
