

NAG C Library Function Document

nag_zhptrd (f08gsc)

1 Purpose

nag_zhptrd (f08gsc) reduces a complex Hermitian matrix to tridiagonal form, using packed storage.

2 Specification

```
void nag_zhptrd (Nag_OrderType order, Nag_UploType uplo, Integer n, Complex ap[],
                double d[], double e[], Complex tau[], NagError *fail)
```

3 Description

nag_zhptrd (f08gsc) reduces a complex Hermitian matrix A , held in packed storage, to real symmetric tridiagonal form T by a unitary similarity transformation: $A = QTQ^H$.

The matrix Q is not formed explicitly but is represented as a product of $n - 1$ elementary reflectors (see the f08 Chapter Introduction for details). Functions are provided to work with Q in this representation (see Section 8).

5 Parameters

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.
- 2: **uplo** – Nag_UploType *Input*
On entry: indicates whether the upper or lower triangular part of A is stored as follows:
 if **uplo** = **Nag_Upper**, the upper triangular part of A is stored;
 if **uplo** = **Nag_Lower**, the lower triangular part of A is stored.
Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.
- 4: **ap**[*dim*] – Complex *Input/Output*
Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.
On entry: the Hermitian matrix A , packed by rows or columns. The storage of elements a_{ij} depends on the **order** and **uplo** parameters as follows:

if **order** = **Nag_ColMajor** and **uplo** = **Nag_Upper**,
 a_{ij} is stored in **ap** $[(j-1) \times j/2 + i - 1]$, for $i \leq j$;
 if **order** = **Nag_ColMajor** and **uplo** = **Nag_Lower**,
 a_{ij} is stored in **ap** $[(2n-j) \times (j-1)/2 + i - 1]$, for $i \geq j$;
 if **order** = **Nag_RowMajor** and **uplo** = **Nag_Upper**,
 a_{ij} is stored in **ap** $[(2n-i) \times (i-1)/2 + j - 1]$, for $i \leq j$;
 if **order** = **Nag_RowMajor** and **uplo** = **Nag_Lower**,
 a_{ij} is stored in **ap** $[(i-1) \times i/2 + j - 1]$, for $i \geq j$.

On exit: A is overwritten by the tridiagonal matrix T and details of the unitary matrix Q .

- 5: **d** $[dim]$ – double *Output*
Note: the dimension, dim , of the array **d** must be at least $\max(1, \mathbf{n})$.
On exit: the diagonal elements of the tridiagonal matrix T .
- 6: **e** $[dim]$ – double *Output*
Note: the dimension, dim , of the array **e** must be at least $\max(1, \mathbf{n} - 1)$.
On exit: the off-diagonal elements of the tridiagonal matrix T .
- 7: **tau** $[dim]$ – Complex *Output*
Note: the dimension, dim , of the array **tau** must be at least $\max(1, \mathbf{n} - 1)$.
On exit: further details of the unitary matrix Q .
- 8: **fail** – NagError * *Output*
 The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, $\mathbf{n} = \langle value \rangle$.
 Constraint: $\mathbf{n} \geq 0$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed tridiagonal matrix T is exactly similar to a nearby matrix $A + E$, where

$$\|E\|_2 \leq c(n)\epsilon\|A\|_2,$$

$c(n)$ is a modestly increasing function of n , and ϵ is the *machine precision*.

The elements of T themselves may be sensitive to small perturbations in A or to rounding errors in the computation, but this does not affect the stability of the eigenvalues and eigenvectors.

8 Further Comments

The total number of real floating-point operations is approximately $\frac{16}{3}n^3$.

To form the unitary matrix Q this function may be followed by a call to `nag_zupgtr` (f08gtr):

```
nag_zupgtr (order,uplo,n,ap,tau,&q,pdq,&fail)
```

To apply Q to an n by p complex matrix C this function may be followed by a call to `nag_zupmtr` (f08guc). For example,

```
nag_zupmtr (order,Nag_LeftSide,uplo,Nag_NoTrans,n,p,ap,tau,&c,
            pdc,&fail)
```

forms the matrix product QC .

The real analogue of this function is `nag_dsptd` (f08gec).

9 Example

To reduce the matrix A to tridiagonal form, where

$$A = \begin{pmatrix} -2.28 + 0.00i & 1.78 - 2.03i & 2.26 + 0.10i & -0.12 + 2.53i \\ 1.78 + 2.03i & -1.12 + 0.00i & 0.01 + 0.43i & -1.07 + 0.86i \\ 2.26 - 0.10i & 0.01 - 0.43i & -0.37 + 0.00i & 2.31 - 0.92i \\ -0.12 - 2.53i & -1.07 - 0.86i & 2.31 + 0.92i & -0.73 + 0.00i \end{pmatrix},$$

using packed storage.
