

NAG C Library Function Document

nag_ztrsna (f08qyc)

1 Purpose

nag_ztrsna (f08qyc) estimates condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix.

2 Specification

```
void nag_ztrsna (Nag_OrderType order, Nag_JobType job, Nag_HowManyType how_many,
  const Boolean select[], Integer n, const Complex t[], Integer pdt,
  const Complex vl[], Integer pdvl, const Complex vr[], Integer pdvr, double s[],
  double sep[], Integer mm, Integer *m, NagError *fail)
```

3 Description

nag_ztrsna (f08qyc) estimates condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix T . These are the same as the condition numbers of the eigenvalues and right eigenvectors of an original matrix $A = ZTZ^H$ (with unitary Z), from which T may have been derived.

nag_ztrsna (f08qyc) computes the reciprocal of the condition number of an eigenvalue λ_i as

$$s_i = \frac{|v^H u|}{\|u\|_E \|v\|_E},$$

where u and v are the right and left eigenvectors of T , respectively, corresponding to λ_i . This reciprocal condition number always lies between zero (i.e., ill-conditioned) and one (i.e., well-conditioned).

An approximate error estimate for a computed eigenvalue λ_i is then given by

$$\frac{\epsilon \|T\|}{s_i},$$

where ϵ is the *machine precision*.

To estimate the reciprocal of the condition number of the right eigenvector corresponding to λ_i , the function first calls nag_ztrexc (f08qtc) to reorder the eigenvalues so that λ_i is in the leading position:

$$T = Q \begin{pmatrix} \lambda_i & c^H \\ 0 & T_{22} \end{pmatrix} Q^H.$$

The reciprocal condition number of the eigenvector is then estimated as sep_i , the smallest singular value of the matrix $(T_{22} - \lambda_i I)$. This number ranges from zero (i.e., ill-conditioned) to very large (i.e., well-conditioned).

An approximate error estimate for a computed right eigenvector u corresponding to λ_i is then given by

$$\frac{\epsilon \|T\|}{sep_i}.$$

5 Parameters

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.
- 2: **job** – Nag_JobType *Input*
On entry: indicates whether condition numbers are required for eigenvalues and/or eigenvectors, as follows:
 - if **job = Nag_EigVals**, then condition numbers for eigenvalues only are computed;
 - if **job = Nag_EigVecs**, then condition numbers for eigenvectors only are computed;
 - if **job = Nag_DoBoth**, then condition numbers for both eigenvalues and eigenvectors are computed.*Constraint:* **job = Nag_EigVals, Nag_EigVecs** or **Nag_DoBoth**.
- 3: **how_many** – Nag_HowManyType *Input*
On entry: indicates how many condition numbers are to be computed, as follows:
 - if **how_many = Nag_ComputeAll**, then condition numbers for all eigenpairs are computed;
 - if **how_many = Nag_ComputeSelected**, then condition numbers for selected eigenpairs (as specified by **select**) are computed.*Constraint:* **how_many = Nag_ComputeAll** or **Nag_ComputeSelected**.
- 4: **select**[*dim*] – const Boolean *Input*
Note: the dimension, *dim*, of the array **select** must be at least $\max(1, \mathbf{n})$ when **how_many = Nag_ComputeSelected** and at least 1 otherwise.
On entry: **select** specifies the eigenpairs for which condition numbers are to be computed if **how_many = Nag_ComputeSelected**. To select condition numbers for the eigenpair corresponding to the eigenvalue λ_j , **select**[*j*] must be set to **TRUE**.
select is not referenced if **how_many = Nag_ComputeAll**.
- 5: **n** – Integer *Input*
On entry: *n*, the order of the matrix *T*.
Constraint: $\mathbf{n} \geq 0$.
- 6: **t**[*dim*] – const Complex *Input*
Note: the dimension, *dim*, of the array **t** must be at least $\max(1, \mathbf{pdt} \times \mathbf{n})$.
If **order = Nag_ColMajor**, the (*i*, *j*)th element of the matrix *T* is stored in **t**[(*j* – 1) × **pdt** + *i* – 1] and if **order = Nag_RowMajor**, the (*i*, *j*)th element of the matrix *T* is stored in **t**[(*i* – 1) × **pdt** + *j* – 1].
On entry: the *n* by *n* upper triangular matrix *T*, as returned by nag_zhseqr (f08psc).
- 7: **pdt** – Integer *Input*
On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **t**.
Constraint: $\mathbf{pdt} \geq \max(1, \mathbf{n})$.

- 8: **vl**[*dim*] – const Complex *Input*
- Note:** the dimension, *dim*, of the array **vl** must be at least
 $\max(1, \text{pdvl} \times \text{mm})$ when **job** = **Nag_EigVals** or **Nag_DoBoth** and **order** = **Nag_ColMajor**;
 $\max(1, \text{pdvl} \times \text{n})$ when **job** = **Nag_EigVals** or **Nag_DoBoth** and **order** = **Nag_RowMajor**;
1 when **job** = **Nag_EigVecs**.
- If **order** = **Nag_ColMajor**, the (*i*, *j*)th element of the matrix is stored in **vl**[(*j* – 1) × **pdvl** + *i* – 1] and if **order** = **Nag_RowMajor**, the (*i*, *j*)th element of the matrix is stored in **vl**[(*i* – 1) × **pdvl** + *j* – 1].
- On entry:* if **job** = **Nag_EigVals** or **Nag_DoBoth**, **vl** must contain the left eigenvectors of *T* (or of any matrix QTQ^H with *Q* unitary) corresponding to the eigenpairs specified by **how_many** and **select**. The eigenvectors **must** be stored in consecutive rows or columns (depending on the value of **order**) of **vl**, as returned by nag_ztrevc (f08qxc) or nag_zhsein (f08pxc).
- vl** is not referenced if **job** = **Nag_EigVecs**.
- 9: **pdvl** – Integer *Input*
- On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **vl**.
- Constraints:*
- if **order** = **Nag_ColMajor**,
 - if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvl** ≥ max(1, **n**);
 - if **job** = **Nag_EigVecs**, **pdvl** ≥ 1;
 - if **order** = **Nag_RowMajor**,
 - if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvl** ≥ max(1, **mm**);
 - if **job** = **Nag_EigVecs**, **pdvl** ≥ 1.
- 10: **vr**[*dim*] – const Complex *Input*
- Note:** the dimension, *dim*, of the array **vr** must be at least
 $\max(1, \text{pdvr} \times \text{mm})$ when **job** = **Nag_EigVals** or **Nag_DoBoth** and **order** = **Nag_ColMajor**;
 $\max(1, \text{pdvr} \times \text{n})$ when **job** = **Nag_EigVals** or **Nag_DoBoth** and **order** = **Nag_RowMajor**;
1 when **job** = **Nag_EigVecs**.
- If **order** = **Nag_ColMajor**, the (*i*, *j*)th element of the matrix is stored in **vr**[(*j* – 1) × **pdvr** + *i* – 1] and if **order** = **Nag_RowMajor**, the (*i*, *j*)th element of the matrix is stored in **vr**[(*i* – 1) × **pdvr** + *j* – 1].
- On entry:* if **job** = **Nag_EigVals** or **Nag_DoBoth**, **vr** must contain the right eigenvectors of *T* (or of any matrix QTQ^H with *Q* unitary) corresponding to the eigenpairs specified by **how_many** and **select**. The eigenvectors **must** be stored in consecutive rows or columns (depending on the value of **order**) of **vr**, as returned by nag_ztrevc (f08qxc) or nag_zhsein (f08pxc).
- vr** is not referenced if **job** = **Nag_EigVecs**.
- 11: **pdvr** – Integer *Input*
- On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **vr**.
- Constraints:*
- if **order** = **Nag_ColMajor**,
 - if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvr** ≥ max(1, **n**);
 - if **job** = **Nag_EigVecs**, **pdvr** ≥ 1;
 - if **order** = **Nag_RowMajor**,
 - if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvr** ≥ max(1, **mm**);
 - if **job** = **Nag_EigVecs**, **pdvr** ≥ 1.

- 12: **s**[*dim*] – double *Output*
- Note:** the dimension, *dim*, of the array **s** must be at least $\max(1, \mathbf{mm})$ when **job** = **Nag_EigVals** or **Nag_DoBoth** and at least 1 when **job** = **Nag_EigVecs**.
- On exit:* the reciprocal condition numbers of the selected eigenvalues if **job** = **Nag_EigVals** or **Nag_DoBoth**, stored in consecutive elements of the array. Thus **s**[*j*], **sep**[*j*] and the *j*th rows or columns of **vl** and **vr** all correspond to the same eigenpair (but not in general the *j*th eigenpair unless all eigenpairs have been selected).
- s** is not referenced if **job** = **Nag_EigVecs**.
- 13: **sep**[*dim*] – double *Output*
- Note:** the dimension, *dim*, of the array **sep** must be at least $\max(1, \mathbf{mm})$ when **job** = **Nag_EigVecs** or **Nag_DoBoth** and at least 1 when **job** = **Nag_EigVals**.
- On exit:* the estimated reciprocal condition numbers of the selected right eigenvectors if **job** = **Nag_EigVecs** or **Nag_DoBoth**, stored in consecutive elements of the array.
- sep** is not referenced if **job** = **Nag_EigVals**.
- 14: **mm** – Integer *Input*
- On entry:* the number of elements in the arrays **s** and **sep**, and the number of rows or columns (depending on the value of **order**) in the arrays **vl** and **vr** (if used). The precise number required, *required_rowcol*, is *n* if **how_many** = **Nag_ComputeAll**; if **how_many** = **Nag_ComputeSelected**, *required_rowcol* is the number of selected eigenpairs (see **select**), in which case $0 \leq \text{required_rowcol} \leq n$.
- Constraint:* $\mathbf{mm} \geq \text{required_rowcol}$.
- 15: **m** – Integer * *Output*
- On exit:* *required_rowcol*, the number of selected eigenpairs. If **how_many** = **Nag_ComputeAll**, **m** is set to *n*.
- 16: **fail** – NagError * *Output*
- The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = *<value>*.

Constraint: **n** ≥ 0 .

On entry, **mm** = *<value>*.

Constraint: $\mathbf{mm} \geq \text{required_rowcol}$, where *required_rowcol* is the number of selected eigenpairs.

On entry, **pdt** = *<value>*.

Constraint: **pdt** > 0 .

On entry, **pdvl** = *<value>*.

Constraint: **pdvl** > 0 .

On entry, **pdvr** = *<value>*.

Constraint: **pdvr** > 0 .

NE_INT_2

On entry, **pdt** = *<value>*, **n** = *<value>*.

Constraint: **pdt** $\geq \max(1, \mathbf{n})$.

NE_ENUM_INT_2

On entry, **job** = *<value>*, **n** = *<value>*, **pdvl** = *<value>*.
 Constraint: if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvl** ≥ max(1, **n**);
 if **job** = **Nag_EigVecs**, **pdvl** ≥ 1.

On entry, **job** = *<value>*, **n** = *<value>*, **pdvr** = *<value>*.
 Constraint: if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvr** ≥ max(1, **n**);
 if **job** = **Nag_EigVecs**, **pdvr** ≥ 1.

On entry, **job** = *<value>*, **mm** = *<value>*, **pdvl** = *<value>*.
 Constraint: if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvl** ≥ max(1, **mm**);
 if **job** = **Nag_EigVecs**, **pdvl** ≥ 1.

On entry, **job** = *<value>*, **mm** = *<value>*, **pdvr** = *<value>*.
 Constraint: if **job** = **Nag_EigVals** or **Nag_DoBoth**, **pdvr** ≥ max(1, **mm**);
 if **job** = **Nag_EigVecs**, **pdvr** ≥ 1.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter *<value>* had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed values sep_i may over estimate the true value, but seldom by a factor of more than 3.

8 Further Comments

The real analogue of this function is nag_dtrsna (f08qlc).

9 Example

To compute approximate error estimates for all the eigenvalues and right eigenvectors of the matrix T , where

$$T = \begin{pmatrix} -6.0004 - 6.9999i & 0.3637 - 0.3656i & -0.1880 + 0.4787i & 0.8785 - 0.2539i \\ 0.0000 + 0.0000i & -5.0000 + 2.0060i & -0.0307 - 0.7217i & -0.2290 + 0.1313i \\ 0.0000 + 0.0000i & 0.0000 + 0.0000i & 7.9982 - 0.9964i & 0.9357 + 0.5359i \\ 0.0000 + 0.0000i & 0.0000 + 0.0000i & 0.0000 + 0.0000i & 3.0023 - 3.9998i \end{pmatrix}.$$
