

NAG C Library Function Document

nag_dtpsv (f16plc)

1 Purpose

nag_dtpsv (f16plc) solves a system of equations given as a real triangular matrix stored in packed form.

2 Specification

```
#include <nag.h>
#include <nagf16.h>

void nag_dtpsv (Nag_OrderType order, Nag_UploType uplo, Nag_TransType trans,
               Nag_DiagType diag, Integer n, double alpha, const double ap[], double x[],
               Integer incx, NagError *fail)
```

3 Description

nag_dtpsv (f16plc) performs one of the matrix-vector operations

$$x \leftarrow \alpha A^{-1}x \quad \text{or} \quad x \leftarrow \alpha A^{-T}x,$$

where A is an n by n real triangular matrix, stored in packed form, x is an n element real vector and α is a real scalar. A^{-T} denotes $(A^T)^{-1}$ or equivalently $(A^{-1})^T$.

No test for singularity or near-singularity of A is included in this function. Such tests must be performed before calling this function.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this argument.
Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.
- 2: **uplo** – Nag_UploType *Input*
On entry: specifies whether A is upper or lower triangular.
uplo = Nag_Upper
 A is upper triangular.
uplo = Nag_Lower
 A is lower triangular.
Constraint: **uplo = Nag_Upper** or **Nag_Lower**.
- 3: **trans** – Nag_TransType *Input*
On entry: specifies the operation to be performed.

trans = Nag_NoTrans

$$x \leftarrow \alpha A^{-1}x.$$

trans = Nag_Trans or Nag_ConjTrans

$$x \leftarrow \alpha A^{-T}x.$$

Constraint: **trans** = Nag_NoTrans, Nag_Trans or Nag_ConjTrans.

4: **diag** – Nag_DiagType *Input*

On entry: specifies whether A has non-unit or unit diagonal elements.

diag = Nag_NonUnitDiag

The diagonal elements are stored explicitly.

diag = Nag_UnitDiag

The diagonal elements are assumed to be 1 and are not referenced.

Constraint: **diag** = Nag_NonUnitDiag or Nag_UnitDiag.

5: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: $n \geq 0$.

6: **alpha** – double *Input*

On entry: the scalar α .

7: **ap**[*dim*] – const double *Input*

Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.

On entry: the n by n triangular matrix A , packed by rows or columns. The storage of elements a_{ij} depends on the **order** and **uplo** arguments as follows:

if **order** = Nag_ColMajor and **uplo** = Nag_Upper,
 a_{ij} is stored in **ap**[($j - 1$) \times $j/2 + i - 1$], for $i \leq j$;
 if **order** = Nag_ColMajor and **uplo** = Nag_Lower,
 a_{ij} is stored in **ap**[($2n - j$) \times ($j - 1$)/2 + $i - 1$], for $i \geq j$;
 if **order** = Nag_RowMajor and **uplo** = Nag_Upper,
 a_{ij} is stored in **ap**[($2n - i$) \times ($i - 1$)/2 + $j - 1$], for $i \leq j$;
 if **order** = Nag_RowMajor and **uplo** = Nag_Lower,
 a_{ij} is stored in **ap**[($i - 1$) \times $i/2 + j - 1$], for $i \geq j$.

8: **x**[*dim*] – double *Input/Output*

Note: the dimension, *dim*, of the array **x** must be at least $\max(1, 1 + (n - 1)|\mathbf{incx}|)$.

On entry: the right-hand side vector b .

On exit: the solution vector x .

9: **incx** – Integer *Input*

On entry: the increment in the subscripts of **x** between successive elements of x .

Constraint: **incx** $\neq 0$.

10: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.6 of the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $\mathbf{incx} = \langle value \rangle$.
Constraint: $\mathbf{incx} \neq 0$.

On entry, $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{n} \geq 0$.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of The BLAS Technical Forum Standard (2001)).

8 Further Comments

None.

9 Example

Solves real triangular system of linear equations, $Ax = y$, where A is a 4 by 4 real triangular matrix, stored in packed storage format, and is given by

$$A = \begin{pmatrix} 4.30 & & & \\ -3.96 & -4.87 & & \\ 0.40 & 0.31 & -8.02 & \\ -0.27 & 0.07 & -5.95 & 0.12 \end{pmatrix}$$

and

$$y = (-12.90, 16.75, -17.55, -11.04)^T.$$

The vector y is stored in \mathbf{x} and `nag_dtpsv (f16plc)`.
