

NAG C Library Function Document

nag_prob_durbin_watson (g01epc)

1 Purpose

nag_prob_durbin_watson (g01epc) calculates upper and lower bounds for the significance of a Durbin–Watson statistic.

2 Specification

```
void nag_prob_durbin_watson (Integer n, Integer ip, double d, double *pdl,
                             double *pdu, NagError *fail)
```

3 Description

Let $r = (r_1, r_2, \dots, r_n)^T$ be the residuals from a linear regression of y on p independent variables, including the mean, where the y values $y_1, y_2, \dots, y_n$ can be considered as a time series. The Durbin–Watson test (see Durbin and Watson (1950), Durbin and Watson (1951) and Durbin and Watson (1971)) can be used to test for serial correlation in the error term in the regression.

The Durbin–Watson test statistic is:

$$d = \frac{\sum_{i=1}^{n-1} (r_{i+1} - r_i)^2}{\sum_{i=1}^n r_i^2},$$

which can be written as

$$d = \frac{r^T A r}{r^T r},$$

where the n by n matrix A is given by

$$A = \begin{bmatrix} 1 & -1 & 0 & \dots & : \\ -1 & 2 & -1 & \dots & : \\ 0 & -1 & 2 & \dots & : \\ : & 0 & -1 & \dots & : \\ : & : & : & \dots & : \\ : & : & : & \dots & -1 \\ 0 & 0 & 0 & \dots & 1 \end{bmatrix}$$

with the non-zero eigenvalues of the matrix A being $\lambda_j = (1 - \cos(\pi j/n))$, for $j = 1, 2, \dots, n-1$.

Durbin and Watson show that the exact distribution of d depends on the eigenvalues of a matrix HA , where H is the hat matrix of independent variables, i.e., the matrix such that the vector of fitted values, $\hat{y}$, can be written as $\hat{y} = Hy$. However, bounds on the distribution can be obtained, the lower bound being

$$d_l = \frac{\sum_{i=1}^{n-p} \lambda_i u_i^2}{\sum_{i=1}^{n-p} u_i^2}$$

and the upper bound being

$$d_u = \frac{\sum_{i=1}^{n-p} \lambda_{i-1+p} u_i^2}{\sum_{i=1}^{n-p} u_i^2},$$

where u_i are independent standard Normal variables.

Two algorithms are used to compute the lower tail (significance level) probabilities, p_l and p_u , associated with d_l and d_u . If $n \leq 60$ the procedure due to Pan (1964) is used, see Farebrother (1980), otherwise Imhof's method (Imhof (1961)) is used.

The bounds are for the usual test of positive correlation; if a test of negative correlation is required the value of d should be replaced by $4 - d$.

5 Parameters

- | | | |
|----|--|---------------------|
| 1: | n – Integer | <i>Input</i> |
| | <i>On entry:</i> the number of observations used in calculating the Durbin–Watson statistic, n . | |
| | <i>Constraint:</i> n > ip . | |
| 2: | ip – Integer | <i>Input</i> |
| | <i>On entry:</i> the number, p , of independent variables in the regression model, including the mean. | |
| | <i>Constraint:</i> ip ≥ 1. | |
| 3: | d – double | <i>Input</i> |
| | <i>On entry:</i> the Durbin–Watson statistic, d . | |
| | <i>Constraint:</i> d ≥ 0.0. | |
| 4: | pdl – double * | <i>Output</i> |
| | <i>On exit:</i> lower bound for the significance of the Durbin–Watson statistic, p_l . | |
| 5: | pdu – double * | <i>Output</i> |
| | <i>On exit:</i> upper bound for the significance of the Durbin–Watson statistic, p_u . | |
| 6: | fail – NagError * | <i>Input/Output</i> |
| | The NAG error parameter (see the Essential Introduction). | |

6 Error Indicators and Warnings

NE_INT

On entry, **ip** = $\langle value \rangle$.
 Constraint: **ip** ≥ 1.

NE_INT_2

On entry, **n** = $\langle value \rangle$, **ip** = $\langle value \rangle$.
 Constraint: **n** > **ip**.

NE_REAL

On entry, **d** = $\langle value \rangle$.
 Constraint: **d** $\geq$ 0.0.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

On successful exit at least 4 decimal places of accuracy are achieved.

8 Further Comments

If the exact probabilities are required, then the first $n - p$ eigenvalues of HA can be computed and nag_prob_lin_chi_sq (g01jdc) used to compute the required probabilities with **c** set to 0.0 and **d** to the Durbin–Watson statistic.

9 Example

The values of n , p and the Durbin–Watson statistic d are input and the bounds for the significance level calculated and printed.
