nag_rngs_beta (g05lec)

1 Purpose

nag_rngs_beta (g05lec) generates a vector of pseudo-random numbers taken from a beta distribution with a and b .

2 Specification

```
void nag_rngs_beta (double a, double b, Integer n, double x[], Integer igen,
                   Integer iseed[], NagError *fail)
```

3 Description

The beta distribution has PDF (probability density function)

$$f(x) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} x^{a-1}(1-x)^{b-1} \quad \text{if } 0 \leq x \leq 1; a, b > 0.0,$$

$$f(x) = 0 \quad \text{otherwise.}$$

One of four algorithms is used to generate the variates depending on the values of a and b . Let α be the maximum and β be the minimum of a and b . Then the algorithms are as follows:

- (i) If $\alpha < 0.5$, Jhnk's algorithm is used, see for example Dagpunar (1988). This generates the beta variate as $u_1^{1/a} / (u_1^{1/a} + u_2^{1/b})$, where u_1 and u_2 are uniformly distributed random variates;
- (ii) If $\beta > 1$, the algorithm BB given by Cheng (1978) is used. This involves the generation of an observation from a beta distribution of the second kind by the envelope rejection method using a log-logistic target distribution and then transforming it to a beta variate;
- (iii) If $\alpha > 1$ and $\beta < 1$, the switching algorithm given by Atkinson (1979) is used. The two target distributions used are $f_1(x) = \beta x^\beta$ and $f_2(x) = \alpha(1-x)^{\beta-1}$, along with the approximation to the switching parameter of $t = (1-\beta)/(\alpha+1-\beta)$;
- (iv) In all other cases, Cheng's BC algorithm (see Cheng (1978)) is used with modifications suggested by Dagpunar (1988). This algorithm is similar to BB, used when $\beta > 1$, but is tuned for small values of a and b .

One of the initialisation functions nag_rngs_init_repeatable (g05kbc) (for a repeatable sequence if computed sequentially) or nag_rngs_init_nonrepeatable (g05kcc) (for a non-repeatable sequence) must be called prior to the first call to nag_rngs_beta (g05lec).

5 Parameters

- 1: **a** – double *Input*
On entry: the parameter, a , of the beta distribution.
Constraint: $\mathbf{a} > 0.0$.
- 2: **b** – double *Input*
On entry: the parameter, b , of the beta distribution.
Constraint: $\mathbf{b} > 0.0$.
- 3: **n** – Integer *Input*
On entry: the number, n , of pseudo-random numbers to be generated.
Constraint: $\mathbf{n} \geq 0$.
- 4: **x**[*dim*] – double *Output*
Note: the dimension, dim , of the array **x** must be at least $\max(1, \mathbf{n})$.
On exit: the n pseudo-random numbers from the specified beta distribution.
- 5: **igen** – Integer *Input*
On entry: must contain the identification number for the generator to be used to return a pseudo-random number and should remain unchanged following initialisation by a prior call to one of the functions `nag_rngs_init_repeatable` (g05kbc) or `nag_rngs_init_nonrepeatable` (g05kcc).
- 6: **iseed**[4] – Integer *Input/Output*
On entry: contains values which define the current state of the selected generator.
On exit: contains updated values defining the new state of the selected generator.
- 7: **fail** – NagError * *Input/Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{n} \geq 0$.

NE_REAL

On entry, $\mathbf{b} = \langle value \rangle$.
Constraint: $\mathbf{b} > 0.0$.
On entry, $\mathbf{a} = \langle value \rangle$.
Constraint: $\mathbf{a} > 0.0$.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

Not applicable.

8 Further Comments

To generate an observation, y , from the beta distribution of the second kind from an observation, x , generated by `nag_rngs_beta` (g05lec) the transformation, $y = x/(1 - x)$, may be used.

9 Example

The example program prints a set of five pseudo-random numbers from a beta distribution with parameters $a = 2.0$ and $b = 2.0$, generated by a single call to `nag_rngs_beta` (g05lec), after initialisation by `nag_rngs_init_repeatable` (g05kbc).
