

NAG C Library Function Document

nag_tsa_varma_update (g13dkc)

1 Purpose

nag_tsa_varma_update (g13dkc) accepts a sequence of new observations in a multivariate time series and updates both the forecasts and the standard deviations of the forecast errors. A call to nag_tsa_varma_forecast (g13dj) must be made prior to calling this function in order to calculate the elements of a reference vector together with a set of forecasts and their standard errors. On a successful exit from nag_tsa_varma_update (g13dkc) the reference vector is updated so that should future series values become available these forecasts may be updated by recalling nag_tsa_varma_update (g13dkc).

2 Specification

```
#include <nag.h>
#include <nagg13.h>
```

```
void nag_tsa_varma_update (Integer k, Integer lmax, Integer m, Integer *mlast,
    const double z[], Integer ik, double ref[], Integer lref, double v[],
    double predz[], double sefz[], NagError *fail)
```

3 Description

Let $Z_t = (z_{1t}, z_{2t}, \dots, z_{kt})^T$, for $t = 1, 2, \dots, n$, denote a k -dimensional time series for which forecasts of $\hat{Z}_{n+1}, \hat{Z}_{n+2}, \dots, \hat{Z}_{n+l_{\max}}$ have been computed using nag_tsa_varma_forecast (g13dj). Given m further observations $Z_{n+1}, Z_{n+2}, \dots, Z_{n+m}$, where $m < l_{\max}$, nag_tsa_varma_update (g13dkc) updates the forecasts of $Z_{n+m+1}, Z_{n+m+2}, \dots, Z_{n+l_{\max}}$ and their corresponding standard errors.

nag_tsa_varma_update (g13dkc) uses a multivariate version of the procedure described in Box and Jenkins (1976). The forecasts are updated using the ψ weights, computed in nag_tsa_varma_forecast (g13dj). If Z_t^* denotes the transformed value of Z_t and $\hat{Z}_t^*(l)$ denotes the forecast of Z_{t+l}^* from time t with a lead of l (that is the forecast of Z_{t+l}^* given observations Z_t^*, Z_{t-1}^*, \dots), then

$$\hat{Z}_{t+1}^*(l) = \tau + \psi_l \epsilon_{t+1} + \psi_{l+1} \epsilon_t + \psi_{l+2} \epsilon_{t-1} + \dots$$

and

$$\hat{Z}_t^*(l+1) = \tau + \psi_{l+1} \epsilon_t + \psi_{l+2} \epsilon_{t-1} + \dots$$

where τ is a constant vector of length k involving the differencing arguments and the mean vector μ . By subtraction we obtain

$$\hat{Z}_{t+1}^*(l) = \hat{Z}_t^*(l+1) + \psi_l \epsilon_{t+1}.$$

Estimates of the residuals corresponding to the new observations are also computed as $\epsilon_{n+l} = Z_{n+l}^* - \hat{Z}_n^*(l)$, for $l = 1, 2, \dots, m$. These may be of use in checking that the new observations conform to the previously fitted model.

On a successful exit, the reference array is updated so that nag_tsa_varma_update (g13dkc) may be called again should future series values become available, see Section 8.

When a transformation has been used the forecasts and their standard errors are suitably modified to give results in terms of the original series Z_t ; see Granger and Newbold (1976).

5 Arguments

The quantities **k**, **lmax**, **ik**, **ref** and **lref** output from nag_tsa_varma_forecast (g13djc) are suitable for input to nag_tsa_varma_update (g13dkc).

1: **k** – Integer *Input*

On entry: k , the dimension of the multivariate time series.

Constraint: $k \geq 1$.

2: **lmax** – Integer *Input*

On entry: the number, l_{\max} , of forecasts requested in the call to nag_tsa_varma_forecast (g13djc).

Constraint: $l_{\max} \geq 2$.

3: **m** – Integer *Input*

On entry: m , the number of new observations available since the last call to either nag_tsa_varma_forecast (g13djc) or nag_tsa_varma_update (g13dkc). The number of new observations since the last call to nag_tsa_varma_forecast (g13djc) is then $m + m_{\text{last}}$.

Constraint: $0 < m < l_{\max} - m_{\text{last}}$.

4: **m_{last}** – Integer * *Input/Output*

On entry: on the first call to nag_tsa_varma_update (g13dkc), since calling nag_tsa_varma_forecast (g13djc), **m_{last}** must be set to 0 to indicate that no new observations have yet been used to update the forecasts; on subsequent calls **m_{last}** must contain the value of **m_{last}** as output on the previous call to nag_tsa_varma_update (g13dkc).

On exit: is incremented by m to indicate that $m_{\text{last}} + m$ observations have now been used to update the forecasts since the last call to nag_tsa_varma_forecast (g13djc).

m_{last} must not be changed between calls to nag_tsa_varma_update (g13dkc), unless a call to nag_tsa_varma_forecast (g13djc) has been made between the calls in which case **m_{last}** should be reset to 0.

Constraint: $0 \leq m_{\text{last}} < l_{\max} - m$.

5: **z[**ik** × **m**]** – const double *Input*

On entry: $z[\mathbf{ik} \times (j - 1) + i - 1]$ must contain the value of $z_{i,n+m_{\text{last}}+j}$, for $i = 1, 2, \dots, k$; $j = 1, 2, \dots, m$, and where n is the number of observations in the time series in the last call made to nag_tsa_varma_forecast (g13djc).

Constraint: if the transformation defined in **tr** in nag_tsa_varma_forecast (g13djc) for the i th series is the log transformation, then $z[\mathbf{ik} \times (j - 1) + i - 1] > 0.0$, and if it is the square-root transformation, then $z[\mathbf{ik} \times (j - 1) + i - 1] \geq 0.0$, for $j = 1, 2, \dots, m$; $i = 1, 2, \dots, k$.

6: **ik** – Integer *Input*

On entry: the first dimension of the arrays **z**, **predz** and **sefz** as declared in the function from which nag_tsa_varma_update (g13dkc) is called.

Constraint: $ik \geq k$.

- 7: **ref**[**lref**] – double *Input/Output*
On entry: must contain the first $(\mathbf{lmax} - 1) \times \mathbf{k} \times \mathbf{k} + 2 \times \mathbf{k} \times \mathbf{lmax} + \mathbf{k}$ elements of the reference vector as returned on a successful exit from `nag_tsa_varma_forecast` (g13djc) (or a previous call to `nag_tsa_varma_update` (g13dkc)).
On exit: the elements of **ref** are updated. The first $(\mathbf{lmax} - 1) \times \mathbf{k} \times \mathbf{k}$ elements store the ψ weights $\psi_1, \psi_2, \dots, \psi_{l_{\max}-1}$. The next $\mathbf{k} \times \mathbf{lmax}$ elements contain the forecasts of the transformed series and the next $\mathbf{k} \times \mathbf{lmax}$ elements contain the variances of the forecasts of the transformed variables; see `nag_tsa_varma_forecast` (g13djc). The last \mathbf{k} elements are not updated.
- 8: **lref** – Integer *Input*
On entry: the dimension of the array **ref** as declared in the function from which `nag_tsa_varma_update` (g13dkc) is called.
Constraint: $\mathbf{lref} \geq (\mathbf{lmax} - 1) \times \mathbf{k} \times \mathbf{k} + 2 \times \mathbf{k} \times \mathbf{lmax} + \mathbf{k}$.
- 9: **v**[**ik** \times **m**] – double *Output*
On exit: **v**[**ik** \times ($j - 1$) + $i - 1$] contains an estimate of the i th component of $\epsilon_{n+\mathbf{mlast}+j}$, for $i = 1, 2, \dots, k; j = 1, 2, \dots, m$.
- 10: **predz**[**ik** \times **lmax**] – double *Input/Output*
On entry: nonupdated values are kept intact.
On exit: **predz**[**ik** \times ($j - 1$) + $i - 1$] contains the updated forecast of $z_{i,n+j}$, for $i = 1, 2, \dots, k; j = \mathbf{mlast} + \mathbf{m} + 1, \mathbf{mlast} + \mathbf{m} + 2, \dots, l_{\max}$.
The columns of **predz** corresponding to the new observations since the last call to either `nag_tsa_varma_forecast` (g13djc) or `nag_tsa_varma_update` (g13dkc) are set equal to the corresponding columns of **z**.
- 11: **sefz**[**ik** \times **lmax**] – double *Input/Output*
On entry: nonupdated values are kept intact.
On exit: **sefz**[**ik** \times ($j - 1$) + $i - 1$] contains an estimate of the standard error of the corresponding element of **predz**, for $i = 1, 2, \dots, k; j = \mathbf{mlast} + \mathbf{m} + 1, \mathbf{mlast} + \mathbf{m} + 2, \dots, l_{\max}$.
The columns of **sefz** corresponding to the new observations since the last call to either `nag_tsa_varma_forecast` (g13djc) or `nag_tsa_varma_update` (g13dkc) are set equal to zero.
- 12: **fail** – NagError * *Input/Output*
The NAG error argument (see Section 2.6 of the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $\mathbf{k} = \langle value \rangle$.

Constraint: $\mathbf{k} \geq 1$.

On entry, $\mathbf{lmax} = \langle value \rangle$.

Constraint: $\mathbf{lmax} \geq 2$.

On entry, **lref** is too small: **lref** = $\langle value \rangle$ but must be at least $\langle value \rangle$.

On entry, **m** = $\langle value \rangle$.
Constraint: **m** > 0.

On entry, **mlast** = $\langle value \rangle$.
Constraint: **mlast** \geq 0.

NE_INT_2

On entry, **ik** < **k**: **ik** = $\langle value \rangle$, **k** = $\langle value \rangle$.

NE_INT_3

On entry, **lmax** = $\langle value \rangle$, **m** = $\langle value \rangle$, **mlast** = $\langle value \rangle$.
Constraint: $0 < \mathbf{m} < \mathbf{lmax} - \mathbf{mlast}$.

On entry, **lmax** = $\langle value \rangle$, **m** = $\langle value \rangle$, **mlast** = $\langle value \rangle$.
Constraint: $0 \leq \mathbf{mlast} < \mathbf{lmax} - \mathbf{m}$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

NE_REF_VEC

On entry, some of the elements of the array **ref** have been corrupted.

NE_RESULT_OVERFLOW

The updated forecasts will overflow if computed.

NE_TRANSFORMATION

On entry, one (or more) of the transformations requested is invalid.

7 Accuracy

The matrix computations are believed to be stable.

8 Further Comments

If a further m^* observations, $Z_{n+\mathbf{mlast}+1}, Z_{n+\mathbf{mlast}+2}, \dots, Z_{n+\mathbf{mlast}+m^*}$, become available, then forecasts of $Z_{n+\mathbf{mlast}+m^*+1}, Z_{n+\mathbf{mlast}+m^*+2}, \dots, Z_{n+l_{\max}}$ may be updated by recalling `nag_tsa_varma_update` (g13dkc) with **m** = m^* . Note that **m** and the contents of the array **z** are the only quantities which need updating; **mlast** is updated on exit from the previous call. On a successful exit, **v** contains estimates of $\epsilon_{n+\mathbf{mlast}+1}, \epsilon_{n+\mathbf{mlast}+2}, \dots, \epsilon_{n+\mathbf{mlast}+m^*}$; columns **mlast** + 1, **mlast** + 2, ..., **mlast** + m^* of **predz** contain the new observed values $Z_{n+\mathbf{mlast}+1}, Z_{n+\mathbf{mlast}+2}, \dots, Z_{n+\mathbf{mlast}+m^*}$ and columns **mlast** + 1, **mlast** + 2, ..., **mlast** + m^* of **sefz** are set to zero.

9 Example

This example shows how to update the forecasts of two series each of length 48. No transformation has been used and no differencing applied to either of the series. `nag_tsa_varma_estimate` (g13ddc) is first called to fit an AR(1) model to the series. μ is to be estimated and $\phi_1(2, 1)$ constrained to be zero. A call to `nag_tsa_varma_forecast` (g13dj) is then made in order to compute forecasts of the next five series values. After one new observation becomes available the four forecasts are updated. A further observation becomes available and the three forecasts are updated.
