## **nag\_real\_polygamma (s14aec)**

### 1 Purpose

nag\_real\_polygamma (s14aec) returns the value of the  $k$ th derivative of the psi function  $\psi(x)$  for real  $x$  and  $k = 0, 1, \dots, 6$ .

### 2 Specification

```
double nag_real_polygamma (double x, Integer k, NagError *fail)
```

### 3 Description

This routine evaluates an approximation to the  $k$ th derivative of the psi function  $\psi(x)$  given by

$$\psi^{(k)}(x) = \frac{d^k}{dx^k} \psi(x) = \frac{d^k}{dx^k} \left( \frac{d}{dx} \log_e \Gamma(x) \right),$$

where  $x$  is real with  $x \neq 0, -1, -2, \dots$  and  $k = 0, 1, \dots, 6$ . For negative non-integer values of  $x$ , the recurrence relationship

$$\psi^{(k)}(x + 1) = \psi^{(k)}(x) + \frac{d^k}{dx^k} \left( \frac{1}{x} \right)$$

is used. The value of  $\frac{(-1)^{k+1} \psi^{(k)}(x)}{k!}$  is obtained by a call to a routine based on PSIFN in Amos (1983).

Note that  $\psi^{(k)}(x)$  is also known as the *polygamma* function. Specifically,  $\psi^{(0)}(x)$  is often referred to as the *digamma* function and  $\psi^{(1)}(x)$  as the *trigamma* function in the literature. Further details can be found in Abramowitz and Stegun (1972).

### 4 Parameters

|   |                     |
|---|---------------------|
| 1: <b>x</b> – double  | <i>Input</i>        |
| <i>On entry</i> : the argument $x$ of the function.   |                     |
| <i>Constraint</i> : <b>x</b> must not be ‘too close’ (see Section 5) to a non-positive integer. |                     |
| 2: <b>k</b> – Integer   | <i>Input</i>        |
| <i>On entry</i> : the function $\psi^{(k)}(z)$ to be evaluated.                                 |                     |
| <i>Constraint</i> : $0 \leq k \leq 6$ .   |                     |
| 3: <b>fail</b> – NagError *   | <i>Input/Output</i> |
| The NAG error parameter (see the Essential Introduction).                                       |                     |

### 5 Error Indicators and Warnings

#### NE\_INT

On entry, **k** = *<value>*.  
 Constraint:  $0 \leq k \leq 6$ .

**NE\_REAL**

On entry,  $x = <\text{value}>$ .

Constraint:  $x$  must not be ‘too close’ to a non-positive integer. That is,  $|x - \text{nint}(x)| \geq \text{machine precision} \times \text{nint}(x)$

**NE\_UNDERFLOW\_LIKELY**

The evaluation has been abandoned due to the likelihood of underflow. The result is returned as zero.

**NE\_OVERFLOW\_LIKELY**

The evaluation has been abandoned due to the likelihood of overflow. The result is returned as zero.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 6 Further Comments

### 6.1 Accuracy

All constants in the underlying functions are given to approximately 18 digits of precision. If  $t$  denotes the number of digits of precision in the floating-point arithmetic being used, then clearly the maximum number in the results obtained is limited by  $p = \min(t, 18)$ . Empirical tests by Amos (1983) have shown that the maximum relative error is a loss of approximately two decimal places of precision. Further tests with the function  $-\psi^{(0)}(x)$  have shown somewhat improved accuracy, except at points near the positive zero of  $\psi^{(0)}(x)$  at  $x = 1.46\dots$ , where only absolute accuracy can be obtained.
