## nag\_complex\_bessel\_k (s18dcc)

### 1 Purpose

nag\_complex\_bessel\_k (s18dcc) returns a sequence of values for the modified Bessel functions  $K_{\nu+n}(z)$  for complex  $z$ , non-negative  $\nu$  and  $n = 0, 1, \dots, N-1$ , with an option for exponential scaling.

### 2 Specification

```
void nag_complex_bessel_k (double fnu, Complex z, Integer n, Nag_ScaleResType scal,
    Complex cy[], Integer *nz, NagError *fail)
```

### 3 Description

nag\_complex\_bessel\_k (s18dcc) evaluates a sequence of values for the modified Bessel function  $K_\nu(z)$ , where  $z$  is complex,  $-\pi < \arg z \leq \pi$ , and  $\nu$  is the real, non-negative order. The  $N$ -member sequence is generated for orders  $\nu, \nu+1, \dots, \nu+N-1$ . Optionally, the sequence is scaled by the factor  $e^z$ .

The function is derived from the routine CBESK in Amos (1986).

**Note:** although the function may not be called with  $\nu$  less than zero, for negative orders the formula  $K_{-\nu}(z) = K_\nu(z)$  may be used.

When  $N$  is greater than 1, extra values of  $K_\nu(z)$  are computed using recurrence relations.

For very large  $|z|$  or  $(\nu + N - 1)$ , argument reduction will cause total loss of accuracy, and so no computation is performed. For slightly smaller  $|z|$  or  $(\nu + N - 1)$ , the computation is performed but results are accurate to less than half of *machine precision*. If  $|z|$  is very small, near the machine underflow threshold, or  $(\nu + N - 1)$  is too large, there is a risk of overflow and so no computation is performed. In all the above cases, a warning is given by the function.

### 5 Parameters

- 1: **fnu** – double *Input*  
*On entry:* the order,  $\nu$ , of the first member of the sequence of functions.  
*Constraint:* **fnu**  $\geq 0.0$ .
- 2: **z** – Complex *Input*  
*On entry:* the argument  $z$  of the functions.  
*Constraint:* **z**  $\neq (0.0, 0.0)$ .
- 3: **n** – Integer *Input*  
*On entry:* the number,  $N$ , of members required in the sequence  $K_\nu(z), K_{\nu+1}(z), \dots, K_{\nu+N-1}(z)$ .  
*Constraint:* **n**  $\geq 1$ .

- 4: **scal** – Nag\_ScaleResType *Input*  
*On entry:* the scaling option.  
 If **scal** = **Nag\_UnscaleRes**, the results are returned unscaled.  
 If **scal** = **Nag\_ScaleRes**, the results are returned scaled by the factor  $e^z$ .  
*Constraint:* **scal** = **Nag\_UnscaleRes** or **Nag\_ScaleRes**.
- 5: **cy[n]** – Complex *Output*  
*On exit:* the  $N$  required function values: **cy**[ $i - 1$ ] contains  $K_{\nu+i-1}(z)$ , for  $i = 1, 2, \dots, N$ .
- 6: **nz** – Integer \* *Output*  
*On exit:* the number of components of **cy** that are set to zero due to underflow. If **nz** > 0 and  $\text{Re } z \geq 0.0$ , elements **cy**[0], **cy**[1], ..., **cy**[**nz** - 1] are set to zero. If  $\text{Re } z < 0.0$ , **nz** simply states the number of underflows, and not which elements they are.
- 7: **fail** – NagError \* *Input/Output*  
 The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **n** =  $\langle \text{value} \rangle$ .  
 Constraint: **n**  $\geq 1$ .

### NE\_COMPLEX\_ZERO

On entry, **z** = (0.0, 0.0).

### NE\_OVERFLOW\_LIKELY

No computation because  $\text{abs}(\mathbf{z}) = \langle \text{value} \rangle < \langle \text{value} \rangle$ .  
 No computation because  $\mathbf{fnu} + \mathbf{n} - 1 = \langle \text{value} \rangle$  is too large.

### NE\_REAL

On entry, **fnu** =  $\langle \text{value} \rangle$ .  
 Constraint: **fnu**  $\geq 0$ .

### NE\_TERMINATION\_FAILURE

No computation – algorithm termination condition not met.

### NE\_TOTAL\_PRECISION\_LOSS

No computation because  $\text{abs}(\mathbf{z}) = \langle \text{value} \rangle > \langle \text{value} \rangle$ .

### NW\_SOME\_PRECISION\_LOSS

Results lack precision because  $\mathbf{fnu} + \mathbf{n} - 1 = \langle \text{value} \rangle > \langle \text{value} \rangle$ .  
 Results lack precision because  $\text{abs}(\mathbf{z}) = \langle \text{value} \rangle > \langle \text{value} \rangle$ .

### NE\_BAD\_PARAM

On entry, parameter  $\langle \text{value} \rangle$  had an illegal value.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

**7 Accuracy**

All constants in `nag_complex_bessel_k` (s18dcc) are given to approximately 18 digits of precision. Calling the number of digits of precision in the floating-point arithmetic being used  $t$ , then clearly the maximum number of correct digits in the results obtained is limited by  $p = \min(t, 18)$ . Because of errors in argument reduction when computing elementary functions inside `nag_complex_bessel_k` (s18dcc), the actual number of correct digits is limited, in general, by  $p - s$ , where  $s \approx \max(1, |\log_{10} |z||, |\log_{10} \nu|)$  represents the number of digits lost due to the argument reduction. Thus the larger the values of  $|z|$  and  $\nu$ , the less the precision in the result. If `nag_complex_bessel_k` (s18dcc) is called with  $\mathbf{n} > 1$ , then computation of function values via recurrence may lead to some further small loss of accuracy.

If function values which should nominally be identical are computed by calls to `nag_complex_bessel_k` (s18dcc) with different base values of  $\nu$  and different  $\mathbf{n}$ , the computed values may not agree exactly. Empirical tests with modest values of  $\nu$  and  $z$  have shown that the discrepancy is limited to the least significant 3 – 4 digits of precision.

**8 Further Comments**

The time taken by the function for a call of `nag_complex_bessel_k` (s18dcc) is approximately proportional to the value of  $\mathbf{n}$ , plus a constant. In general it is much cheaper to call `nag_complex_bessel_k` (s18dcc) with  $\mathbf{n}$  greater than 1, rather than to make  $N$  separate calls to `nag_complex_bessel_k` (s18dcc).

Paradoxically, for some values of  $z$  and  $\nu$ , it is cheaper to call `nag_complex_bessel_k` (s18dcc) with a larger value of  $\mathbf{n}$  than is required, and then discard the extra function values returned. However, it is not possible to state the precise circumstances in which this is likely to occur. It is due to the fact that the base value used to start recurrence may be calculated in different regions for different  $\mathbf{n}$ , and the costs in each region may differ greatly.

Note that if the function required is  $K_0(x)$  or  $K_1(x)$ , i.e.,  $\nu = 0.0$  or  $1.0$ , where  $x$  is real and positive, and only a single function value is required, then it may be much cheaper to call `nag_bessel_k0` (s18acc), `nag_bessel_k1` (s18adc), `nag_bessel_k0_scaled` (s18ccc) or `nag_bessel_k1_scaled` (s18cdc), depending on whether a scaled result is required or not.

**9 Example**

The example program prints a caption and then proceeds to read sets of data from the input data stream. The first datum is a value for the order **fnu**, the second is a complex value for the argument, **z**, and the third is a character value used as a flag to set the parameter **scal**. The program calls the function with  $\mathbf{n} = 2$  to evaluate the function for orders **fnu** and **fnu** + 1, and it prints the results. The process is repeated until the end of the input data stream is encountered.
