NAG Toolbox for MATLAB

f08hn

1 Purpose

f08hn computes all the eigenvalues and, optionally, all the eigenvectors of a complex n by n Hermitian band matrix A of bandwidth $(2k_d + 1)$.

2 Syntax

```
[ab, w, z, info] = f08hn(jobz, uplo, kd, ab, 'n', n)
```

3 Description

The Hermitian band matrix A is first reduced to real tridiagonal form, using unitary similarity transformations, and then the *QR* algorithm is applied to the tridiagonal matrix to compute the eigenvalues and (optionally) the eigenvectors.

5 Parameters

5.1 Compulsory Input Parameters

1: **jobz – string**

If **jobz** = 'N', compute eigenvalues only.

If **jobz** = 'V', compute eigenvalues and eigenvectors.

Constraint: **jobz** = 'N' or 'V'.

2: **uplo – string**

If **uplo** = 'U', the upper triangular part of A is stored.

If **uplo** = 'L', the lower triangular part of A is stored.

Constraint: **uplo** = 'U' or 'L'.

3: **kd – int32 scalar**

If **uplo** = 'U', the number of superdiagonals, k_d, of the matrix A.

If **uplo** = 'L', the number of subdiagonals, k_d, of the matrix A.

Constraint: **kd** ≥ 0.

4: **ab**(**ldab**,$*$) **– complex array**

The first dimension of the array **ab** must be at least **kd** $+ 1$

The second dimension of the array must be at least $\max(1, \mathbf{n})$

The upper or lower triangle of the n by n Hermitian band matrix A.

The matrix is stored in rows 1 to $k_d + 1$, more precisely,

if **uplo** = 'U', the elements of the upper triangle of A within the band must be stored with element A_{ij} in $\mathbf{ab}(k_d + 1 + i - j, j)$ for $\max(1j - k_d) \leq i \leq j$;
if **uplo** = 'L', the elements of the lower triangle of A within the band must be stored with element A_{ij} in $\mathbf{ab}(1 + i - j, j)$ for $j \leq i \leq \min(nj + k_d)$.

5.2 Optional Input Parameters

1: **n – int32 scalar**

Default: The second dimension of the array **ab**.

n, the order of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

5.3 Input Parameters Omitted from the MATLAB Interface

ldab, ldz, work, rwork

5.4 Output Parameters

1: **ab**(**ldab,**$*$) **– complex array**

The first dimension of the array **ab** must be at least $\mathbf{kd} + 1$

The second dimension of the array must be at least $\max(1, \mathbf{n})$

ab contains values generated during the reduction to tridiagonal form.

The first superdiagonal and the diagonal of the tridiagonal matrix T are returned in **ab** using the same storage format as described above.

2: **w**($*$) **– double array**

Note: the dimension of the array **w** must be at least $\max(1, \mathbf{n})$.

If **info** = 0, the eigenvalues in ascending order.

3: **z**(**ldz,**$*$) **– complex array**

The first dimension, **ldz**, of the array **z** must satisfy

if **jobz** = 'V', **ldz** $\geq \max(1, \mathbf{n})$;
ldz ≥ 1 otherwise.

The second dimension of the array must be at least $\max(1, \mathbf{n})$

If **jobz** = 'V', then if **info** = 0, **z** contains the orthonormal eigenvectors of the matrix A, with the ith column of Z holding the eigenvector associated with $\mathbf{w}(i)$.

If **jobz** = 'N', **z** is not referenced.

4: **info – int32 scalar**

info = 0 unless the function detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the function:

info $= -i$

If **info** $= -i$, parameter i had an illegal value on entry. The parameters are numbered as follows:

1: **jobz**, 2: **uplo**, 3: **n**, 4: **kd**, 5: **ab**, 6: **ldab**, 7: **w**, 8: **z**, 9: **ldz**, 10: **work**, 11: **rwork**, 12: **info**.

It is possible that **info** refers to a parameter that is omitted from the MATLAB interface. This usually indicates that an error in one of the other input parameters has caused an incorrect value to be inferred.

info > 0

If **info** $= i$, the algorithm failed to converge; i elements of an intermediate tridiagonal form did not converge to zero.

7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the ***machine precision***. See Section ua4.7 of Anderson *et al.* 1999 for further details.

8 Further Comments

The total number of floating-point operations is proportional to n^3 if **jobz** = 'V' and is proportional to $k_d n^2$ otherwise.

The real analogue of this function is f08ha.

9 Example

```
jobz = 'Vectors';
uplo = 'U';
kd = int32(2);
ab  =  [complex(0,  0),  complex(0,  0),  complex(3,  -1),  complex(4,  -2),
complex(5, -3);
        complex(0,  0),  complex(2,  -1),  complex(3,  -2),  complex(4,  -3),
complex(5, -4);
       complex(1,  +0),  complex(2,  +0),  complex(3,  +0),  complex(4,  +0),
complex(5, +0)];
[abOut, w, z, info] = f08hn(jobz, uplo, kd, ab)
```
